A Proposal is being considered to establish at Swansea, as a great manufacturing centre, a branch university college, in association with either Aberystwyth or Cardiff, as the Newcastle College is associated with Durham. The suggestion is that scientific and technical courses might be taken at Swansea in preparation for the Welsh University degree.

The next Ordinary Meeting of the Society of Engineers, will be held at the Royal United Service Institution, Whitehall, on Monday, October 4, when a paper will be read entitled "Filter Presses for Sewage Sludge," by Mr. James Croll.

The Architect.

THE WEEK.

CONTRACTS for repairing footways in the City are not desirable trusts unless a very liberal price is allowed. There are crowds always in motion who use strong language if particles of stone are in circulation and who no less resent screens, although put up for their protection. The police have to be wary, for the complaint of a passer-by who looked too curiously at the operations and believed he was touched by a fragment of flagging would be followed by official reprimands. Messrs. MOWLEM & Co. have had a long experience of the difficulties and are painstaking in order to satisfy the public and police as well as the Commissioners of Sewers. It is rarely they are summoned, but some months ago they were compelled to appear in the Summons Court, when the case was dismissed. This week they were again summoned because while repairing a flagstone in Wood Street they had not set up a screen. It appears the screen had been standing for hours, but when the repairs were nearly finished the protection was laid low in order to make it unnecessary for the frequenters of the street to use an abundance of objurgations. But a screen must be kept upright regardless of strong language, and, while complimenting the firm on their efforts to insure the safety of the citizens, the alderman inflicted fines. It is difficult to please all parties in London, and in this case the Commissioners of Sewers should pay the amount levied.

DURING several years the lady chapel of Gloucester Cathedral has been closed, but it was reopened on Wednesday after reparation. It is one of the latest parts of the cathedral, as it was erected between A.D. 1472 and 1498, while there are other parts of the building which date from A.D. 1089. Much skill is seen in the planning, for the chapel does not interfere with the light of the large window in the choir, which, in spite of the ungraceful figures, is most effective. The lady chapel was originally splendid in its appearance. In style it resembles the choir. The present chapel appears to have taken the place of one founded in the thirteenth century by RALPH DE WYLINGTON, who gave a rent for the support of two priests, who were to celebrate Divine service in perpetuity. FOSBROOKE gives a copy of an agreement which was entered into with RALPH DE WYLINGTON respecting the two priests. They were to receive a salary of two marks and a half yearly, with eighteen pennies yearly for cheese and candles, two monk's loaves, a knight's loaf, three gallons of convent beer and one of second beer, three dishes of the better broth of the convent, two messes of flesh, and they were to have the use of vessels from the bakehouse. They were to dwell in the abbey in a lodging provided by RALPH. The document is curious as a revelation of the treatment of clerics who were not members of a monastery. Beneath the east end of the lady chapel is a passage which was intended as a means of communication between the land on the north and south side.

THE Brighton School Board have investigated the subject of payment to the standing surveyor, and information on the subject has been sought and obtained from a great many school boards throughout the country. It appears that in some cases the surveyor is paid by fees, and in others partly by fees and partly by a fixed salary. In Brighton it has hitherto been the custom to pay the surveyor entirely by fees; but seeing that the number of schools has largely increased of late years, and that the amount paid to the surveyor for the supervision of repairs has also grown considerably, the committee are of opinion that the time has arrived when a change may with advantage be made. The following figures show the sums which have been annually paid to the surveyor during the last six years for the supervision of general repairs and small alterations and additions carried out at the various schools:—1891, 114*l.* 7*s.*; 1892 and 1893, 231*l.* 16*s.* 3*d.*; 1894, 81*l.* 0*s.* 11*d.*; 1895, 256*l.* 2*s.* 6*d.*; 1896, 243*l.* 15*s.* 8*d.* For all new schools and important enlargements for which a loan has been obtained it has been the custom to pay a uniform commission of 5 per cent. for the preparation of the plans, &c., and the super-

vision of the work; whilst 2½ per cent. has been paid for the preparation of the quantities. A fee of about 10*l.* 10*s.* or 12*l.* 12*s.* has also been paid for extra plans provided for the Education Department and the Town Council. In the future it is proposed to continue the commission at the rate of 5 per cent. for all new work, but such commission is to include the preparation of all plans required. It is also proposed to reduce the commission on the quantities from 2½ to 1½ per cent. As to the supervision of general repairs, with regard to which there has been no fixed rate of commission, and the charge has been fixed on the basis of the time occupied, the committee think it will be an advantage that the surveyor's remuneration for these duties should be by a fixed salary, and they propose that in future a salary of 125*l.* should be paid to the surveyor for the preparation of plans, and the supervision of all works where the cost of any single job shall not exceed 50*l.* This salary will include attendance at committees, &c. For all works which may cost more than 50*l.* a commission of 5 per cent. will be given. It is estimated that the amount paid to the surveyor for the supervision of repairs, &c., including the salary of 125*l.*, will be about 175*l.* per annum. The anticipated saving will not be more than 50*l.* a year, but occupation has been found for the sites and works committee in the inquiry.

WE have lately noticed some cases in which tenders were allowed to be withdrawn or revised. It appears that in the United States the subject is now receiving attention. The *American Architect*, referring to one case, says:—A certain amount of discontent has been expressed at a decision of the supervising architect of the Treasury Department in regard to the award of the contract for the new public building at Paterson, N.J. The bids for the building were publicly opened August 10, and that of Mr. C. A. MOSES, of Chicago, was found to be more than thirty thousand dollars less than any other. Mr. MOSES was, apparently, led by this discovery to revise his figures, and ascertained, to his own satisfaction and that of the supervising architect, that he had made mistakes in his calculations. He was, in consideration of this, allowed to withdraw his bid and the certified check which he had deposited as security for entering into a proper contract in accordance with his bid; and all the bids were rejected, and a call for new bids issued. The consequence of all this is, as the other bidders contend, that while Mr. MOSES has reason to congratulate himself on the ruling of the supervising architect, by which he was saved from losing a large sum of money through a clerical error, the others, who were careful enough not to make mistakes, find that they have gone to the trouble and expense of making their estimates for nothing, and that, in addition to this, all their tenders have been made public, so that they are at a disadvantage in estimating a second time. They think, naturally enough, that if Mr. MOSES were allowed to withdraw his tender that of the next lowest bidder should have been accepted. It is probable that the law, which regulates very strictly every detail of the award of contracts for public buildings, would not permit this to be done; so that the rejection of all the bids was the only way in which the supervising architect could relieve the Government from the odium of taking advantage of a mistake, to the injury of a citizen; but the other bidders are certainly right in feeling that they have something to complain of. It is said that the supervising architect has given notice that, hereafter, bidders who withdraw their tenders in this way will forfeit their certified checks; and this is certainly no more than justice.

ALTHOUGH very few know it, it is a fact that the Pension Office in Washington is the largest brick building in the world. It has been subjected to much criticism, but it can stand it, for as time passes along there are many things observed that escaped notice when it was newer. In all there are over 10,000,000 bricks in the building. General MEIGS took liberties with bricks that no other architect had ever attempted. He not only used them exclusively for the structure, but he used them in constructing the stairs throughout the building. In the matter of stair building bricks have often been used for the riser, but the step has always been of iron, wood, slate or stone.

FRENCH CRITICISM OF MR. RUSKIN.—II.

BY A CORRESPONDENT.

BETWEEN 1860, when M. MILSAND endeavoured to reveal Mr. RUSKIN to Frenchmen, and the present time, when M. ROBERT DE LA SIZERANNE has attempted a similar task, French criticism has undergone many changes. The importance attached to heredity has revived SAINTE-BEUVE's process of seeking physiological causes for a writer's peculiarities by inquiring into the character of himself and his ancestors. Evolution has also exercised extraordinary influence on criticism, and much older systems under new faces have affected the thoughts of Frenchmen. Positivism, among others, which was never popular in England, has attained a development among critics which would surprise COMTE or LITTRÉ. As a consequence, M. DE LA SIZERANNE's essays present a method altogether different to M. MILSAND'S. To the latter the English writer was like a voice crying out in the wilderness, and the critic's duty was to consider what was said without any regard to the person who uttered the words. M. SIZERANNE, on the contrary, begins with a description of JOHN RUSKIN as a boy of fourteen, when in the year 1833 he descended at a hotel in Schaffhausen, along with his father and mother and a little girl, a cousin, of about his own age. It is the first glimpse of the writer which history grants us. We learn that the father was a most honourable man, who married rather late in life because he wished to pay off the debts his own father had incurred as a member of the firm of RUSKIN, TELFORD & DOMEQ, wine merchants in Billiter Street. The mother was kindly but strict towards her son, religious in the sense the word was then understood about Herne Hill, and jealous of every thing and every one who might attract the boy's attention from her. In consequence young RUSKIN was brought up as a solitary; he seems to have had no companions, no temptation to muscle-making mischief. Mrs. RUSKIN's dream was to see her son become a popular evangelical clergyman of the Clapham district, and apparently he was disposed to satisfy her. He studied grave doctrinal treatises as well as books of science. His state of mind may be judged from the efforts he made to ingratiate himself with Mdle. DOMEQ, the daughter of one of the members of the firm. He could not resist love's young dream, but as the charmer was Spanish, Parisienne and Romanist, it was characteristic that he felt it was his duty to convert as well as love her. This he attempted to do by dissertations on the Spanish Armada, the Battle of Waterloo and the doctrine of Transubstantiation. Mdle. DOMEQ enjoyed the fun, but Mrs. RUSKIN was too orthodox in religion, too firm in her toryism, to approve of a Spaniard, although of the converted class, as a daughter-in-law, and summarily put an end to the delusion. There was for a time the usual amount of mental disturbance on the lad's part, but he wrote some verses about a broken chain and cured himself in that way.

Happily for JOHN RUSKIN, there was an influence which counteracted his mother's puritanism. The elder RUSKIN was his own commercial traveller. Like men of that class, he was bound to endure the weariness of long evenings in inns and hotels. The majority of his fellow-travellers found a solace in strong drink, but Mr. RUSKIN was, fortunately for himself and for his son, an amateur. He could sketch and he could enjoy drawings. He spent his lonely evenings with his portfolios. Whilst driving in his excursions he saw lovely scenery, and he wished to share the pleasure he felt. As soon therefore as his only son was old enough to sit upright in a gig, he and his mother became the constant travelling companions of the wine merchant. In that way not only the beauties of England and Wales were explored, but also many of those on the Continent. Could there be a better education for an impressionable child, who appeared to be destined to make men acquainted with the splendour of the world that was around and above them, and which they had so long neglected? Young RUSKIN soon became an observer; then he wished to put his observations on record, and JOHN CLAUDIUS LOUDON was willing to oblige him, for such contributions as those signed "Kata Plusin" did not every day reach the editor's hands. They were what they professed to be, derived

from nature, and ever afterwards the author was faithful to the principle which inspired his youth. Critics may dispute Mr. RUSKIN's conclusions, but about the accuracy of his descriptions of works of nature or art there is no question, and there never was a writer who expended so much time and money in order to be able to present things as they are before the eyes of his readers.

Before he had reached Oxford as a student, JOHN RUSKIN had amassed information which was sufficient to puzzle most of the professors. What he was taught in the schools did not confute it, for in 1843 the "Oxford Graduate" brought out the first volume of "Modern Painters," the pages displaying an Erdkunde, or knowledge of a part of the earth's surface, of a kind which was hitherto unknown in the belles-lettres. Criticism of landscape painters' work was familiar, but even the Rev. JOHN EAGLES, "The Sketcher," who liked to compare a picture with the scene represented, appeared to see mere outlines, while the graduate suggested the possession of a vision which was at the same time microscopic and yet comprehensive. The remaining volumes of "Modern Painters" were marked by stronger powers of observation, which were likewise displayed in a different field in the "Stones of Venice" and succeeding works on art. The materials for them were not to be sought in the Bodleian. Like DICKENS, but in another sense of the phrase, Mr. RUSKIN could describe himself as an uncommercial traveller who was always on the road, and as a representative of the great house of Human Interest Brothers. As M. SIZERANNE says, "The history of his life is only the history of his encounters with nature, of the voyages that he renewed year after year, and which for two-thirds of his existence were with his parents, and alone after their death. He did not seek nature as a refuge from lassitude and disillusion, or as a distraction for idle hours; he went to her in the strength of his manhood, as to a deity who could renew his youth. She was not only the consoler, she was his love."

When M. MILSAND wrote in 1860 Mr. RUSKIN was to him only an eloquent writer on art. But in that year a change came over him. He felt that the house of Human Interest Brothers demanded something else from him than descriptions of the sublimities to be found among the Alps or the gorgeousness of Venetian palaces. He came down from his heights in the hope he could give a new interpretation to the Dismal Science, and, beginning with "Unto this Last," wrote book after book to suggest that the pursuit of wealth can be followed without a destruction of human feelings. In England, where life is so hard, it is excusable if we do not always take the sages seriously and look on them as intended to make sport for us. The more solemn they are, the more amusing we find them. The Ruskinian economics were only accepted as practicable by a select few, and the writer was recommended to return to the mountains and the palaces. But M. SIZERANNE looks on them with a seriousness that denotes conviction of their acceptance at a later time by a reformed world. When speaking of the master's seclusion of late years at Coniston, he says:—"The clouds generally assemble around the highest summits alone. Probably the summit of Coniston will one day appear still higher when to the mists of fiction death has added a supreme and holy obscurity. Then perhaps the innumerable tourists for whom RUSKIN has changed the stones of Venice into bread and the jewels of Pallas Athené into flowers will journey to see a spot where the man dwelt who inspired so many souls and enkindled the fire where so many flambeaux were lighted. The railways that he so strongly combated may bring there pilgrims of æsthetics from all parts of the world. If, however, ugliness should triumph, with the aid of science as an accomplice and of political economy as an ally, then he may be considered as a fabulous personage, the man who struggled alone against a world, not for truth which has its prophets, not for justice which has its apostles, not for religion which has its martyrs, but for beauty, the only principle that was without a champion, and which may never have another victory." A passage like the foregoing reveals how deeply M. SIZERANNE is impressed by Mr. RUSKIN's manner of writing and thinking.

The writer M. SIZERANNE has to describe is a far more complex being than came under the notice of M. MILSAND. How is the author of so many speculations to be made to

appear as the possessor of unity? Unless some one quality, subject or thing is made to stand out in high relief from an assemblage of qualities, subjects and things, no clear idea can be formed. M. SIZERANNE boldly assumes that with Mr. RUSKIN beauty is the sovereign power which controls all his works, or, we may say, is the master key to all their difficulties; and, moreover, it is to be esteemed as the panacea for all our social and moral evils. He maintains that Mr. RUSKIN looks at everything with the eye of a painter. History to him becomes a sort of public place put in perspective by CANALETTO, with figures that recall GUARDI or TIEPOLO. A clover leaf on a coin brings to his mind the struggles between the Florentines and Pisans, or the growth of the popular party in Florence. He thinks in images, and wherever possible he substitutes a plastic for a literary image. In order to impress a passage on his reader's memory he does not hesitate occasionally to print it in red. He is not a *littérateur* who paints, he is rather a painter who writes, and for whom words have the signification of drawings or models. He has, too, the rarest of all gifts, that is, a love for whatever his eye rests on. You will find reasoning as close in LESSING, says M. SIZERANNE, and MICHELET is more careful in his images; STENDHALL has psychology, TOPFFER humour, FROMENTIN technique, WINCKELMANN dialectics, THEO GAUTIER colour, REYNOLDS pedagogics, TAINE generalisation, CHARLES BLANC "la répertoire," but RUSKIN has love. His books are traversed by a breath of enthusiasm; if any part is chaotic it is because his hand has trembled with emotion.

It is not to images and pictures that Mr. RUSKIN would limit beauty. In times of religious doubt, when he could rail at the "insolence of faith" and the "insolence of science," light came to him amidst ideas of the beautiful. The Christian religion, as M. SIZERANNE points out, assumed a new aspect when he recollected how the Founder told His disciples to consider the lilies of the field which surpassed SOLOMON in all his glory, and appeared sometimes as a gardener, sometimes as a vinedresser. But while remembering the lily and other forms in which the saint and the artist can find delight, Mr. RUSKIN does not wish to see rich people go about as severely clad as the old Florentines described by DANTE. Let them wear magnificent robes, he says, but let them also clothe, feed and educate those who, without such care, appear destined to make nature's intentions worthless, for in a world of beauty they are embodiments of ugliness.

We might adopt the Lady CAROLINA WILHELMINA AMELIA SKEGG's formula and say, "Beauty is worth any price, but where is it to be found?" Mr. RUSKIN, as we all know, replies by answering, "In animal and vegetable forms so long as they are not altered to please men's fancies." He has no care for selection, for he does not believe we have taste enough for the operation. Nature, he believes, has plentifully created patterns; it is our own fault if we neglect to utilise them. M. SIZERANNE in such recommendations has to bear with much which is condemnatory of the French styles, but he appears to be fascinated with all Mr. RUSKIN says, and accepts his words as if they were the gospel of art. And if we ask why he is so loyal, he tells us it is because the master has founded his work on nature. With Mr. RUSKIN, he says, the passion for nature has been the beginning and end of all things. It has composed each feature of his physiognomy; it has dictated each of his works; it has directed the course of all his thoughts. While it has made him employ science, it has saved him from the vanity of science by revealing to him æsthetic relations which science fails to discover. Why is it, asks M. SIZERANNE, that Mr. RUSKIN is so great a lover of Gothic architecture? And he answers by saying, It is because in that style are to be found more suggestions of nature, of stems, branches, flowers, and leaves. It may be, adds M. SIZERANNE, that in the night in which we live both savants and magi are led astray by wandering lights, while shepherds are guided by a star. But if men like RUSKIN are wandering spirits still, if they have the desire for truth, if they are free from self-seeking and pride, whatever may be the oasis to which they are led, it will be for them as a Bethlehem. And with the old man who, during sixty years, has been exclaiming, "Glory to beauty in the heavens," some angels who have not departed from the

earth may join with him in the prayer, "Peace on earth to men of good will."

Considering the general state of France it is remarkable to find a writer of that country turning to England and Mr. RUSKIN for inspiration in doubts and difficulties. Every one of us must hope that what is sought will be found. If Mr. RUSKIN's philosophy is not accepted Frenchmen at least will have the satisfaction of knowing that in M. DE LA SIZERANNE's essays they have the best exposition of the doctrines of the English writer on art which can be found. The essays are comparable to TAINE's "La Fontaine" in being a sort of microcosm in which the reader can find a place for his special studies.

THE CATHEDRAL OF LUÇON.

By J. A. RANDOLPH.

AMONG those interesting towns in France around which still lingers the romance of history, the "overgrown village" of Luçon has a claim on visitors to that country which few can boast of.

It is true that Domestic architecture was, in its artistic sense, practically unknown to the inhabitants; yet from an architectural standpoint there is an undoubted attraction in its "cathedral," if it can be called such now the see is extinct.

Luçon stands in low-lying ground but a few miles north of La Rochelle, and about the same distance inland from the Atlantic sea-board. The marshes at the west of the town are unhealthy, the landscape about is uninteresting up to Nantes, and for miles round there is hardly a single attraction of note for the antiquary save La Rochelle, Nantes and Bressuire. The houses of Luçon are wonderfully plain and unattractive; the streets are irregular and atrociously paved; the road to the station is a ten minutes' uninteresting drive over a mixture of earth, sand and cobbles (and, when we saw it, of mud and puddles) in an attempt at a railway 'bus. All tends rather to dissuade the intending visitor than otherwise. However, there is the knowledge of the existence of a most interesting church to persuade the stranger to face any discomfort and any disappointment in the way of picturesque houses *en route* and in Luçon, apart from the associations of the place with the Red Eminence, who, when exiled to it after being disgraced at court, dubbed the see, of which he was bishop at the time of his exile, the looest and most miserable one in the country.

The cathedral is, for France, distinctly unusual in plan, having a square east end, which is lighted by a huge window divided by only a single mullion running up to the level of the spring of the window arch, and branching off to form two colossal lancets and a vast "open head." The church was originally smaller, and the Romanesque north porch and transept testify to its antiquity. The rest of the church, with the exception of the tower, is less ornate thirteenth-century than ours, and the tracery in some of the windows is more like our Early Decorated than the French Decorated. But the steeple is certainly the strangest architectural medley imaginable. The porch, a massive stone affair, designed by JACQUES LE MERCIER, Cardinal RICHELIEU's architect, is, of course, Renaissance in style. It stands in a hollow, which detracts from the elegance of the proportions of the steeple. Above it rise two storeys or stages, flanked by grouped columns, all round the tower, the belfry windows in the upper storey being, on each face, traceried "three lights" with a Renaissance treatment of detail that is as singular as it is graceful. The most curious elements in the construction are the parapet, the corner pinnacles and the crocketed spire of fourteenth-century style, placed as they are on a Renaissance tower—a daring but most happy innovation. The grouping of columns on the tower and in the west porch is treated in the same way at the church of the Sorbonne at Paris, also LE MERCIER's work, and this leads us to suspect that he was mainly responsible for the cathedral at Rennes, a noteworthy specimen of a Renaissance church with grouped columns up the twin west towers, the interior being singularly Italian, and very like the Araceli Church

in Rome. The porch, too, at Rueil, outside Paris, is much the same as that of the church at Richelieu; but, in spite of his rather monotonous work, which contains none of the graceful flowing tracery we associate with and admire in Gothic work, LE MERCIER showed in several ways remarkable freedom from anything approaching a "school," and perhaps his most striking example of this individuality, if we except the grand front of Rennes Cathedral, were the twin spires at Richelieu Church arising from the transepts. Indeed, the detail of the front at Luçon, without taking the grouped columns into consideration, as well as that of the front at Rennes, with the same proviso, are palpably inspired from the same sources.

There used to be a polychromed pulpit in the church, but this has been removed to the "Bishop's Palace," a simple but graceful structure on the south side, with an exquisite Gothic cloister, the detail of which is just tinged with Renaissance. The pulpit just alluded to is said to have been occupied on several occasions by RICHELIEU. His portrait, as Bishop of Luçon, is in one of the large rooms of the palace, among other contemporary portraits of bishops of the see.

In connection with the cathedral there is a charming example of a local Cambridge chime for the hours, half-hours and quarters, totally unlike anything we have heard before. The first quarter is on two bells and does not strike one as being anything out of the common. At the half-hour the first quarter is repeated, followed by the first bell of the first quarter and another bell; at the quarter to the hour the first two quarters are repeated, with the addition of a "descending triplet," the last of the three bells being the last bell of the half-hour; the hour is the same as the three-quarters, followed by a "descending quintet," with a pause between the third and fourth bells, the hour striking on a sixth and deeper toned bell. The introduction of a similar chime into our country would indeed be a welcome relief from the cut-and-dried inartistic and stale "Cambridge chime."

On the west side of the cathedral is an agreeable raised plateau with noble trees, where the fair is held; and the "market-place" is in the roadways at the west and north of the cathedral—an extremely picturesque sight on a bright summer's day.

At the eastern extremity of the town, behind the church, is a hideous covered market, an attempt at a diminutive classical pagan temple to all appearances, and not worth while going out of one's way to see. The shops of Luçon are nothing extraordinary in the way of "show," but the better-class section of them are decidedly good.

RUBENS AND ANTWERP.

THERE is no city in Europe which is more closely associated with the memory of a great artist than is Antwerp with RUBENS. It might be supposed he was the only celebrity. The reputation of the rulers of Antwerp has either vanished or has become odious, but RUBENS appears as a sort of guardian spirit. Sir JOSHUA REYNOLDS speaks of him as "canonised." And yet he was not a native of the city. Siegen, in Westphalia, has the honour of being his birthplace. It is true his father, the lawyer, JOHN RUBENS, and his mother, MARY PYPELING, belonged to Antwerp, and nobody would on that account venture to say that the painter was a stranger. His father had somehow made himself obnoxious to the Spaniards, and he emigrated to Cologne. There also he was considered as a disaffected person, and was exiled to Siegen, where the future painter and diplomatist was born on June 28, 1577, and was named PETER PAUL, after the apostles, whose feast was celebrated next day. In the following year the family was allowed to return to Cologne, and remained there until 1587, when JOHN RUBENS died. His mother went back with her children to Antwerp.

It was intended that young RUBENS should become a lawyer like his father. But he prevailed with his mother to allow him to study art. His masters were TOBIAS VERHAAGT, ADAM VANNOORT, and the more famous OTHO VENIUS. He spent four years in the atelier of the last. Then he left Flanders for Italy. Art was not apparently the only occupation of the brilliant young

man. He obtained an appointment with VINCENZIO GONZAGA, Duke of Mantua, and appears to have divided his time between diplomatic missions and the copying of pictures. When he gained repute as a portrait-painter he must have often aided the Duke's cause by conversations with his sitters. In 1608 he was again in Antwerp, having returned in the hope of seeing his mother, but that satisfaction was denied him. It was RUBENS's desire to go back to Mantua, but on the appeal of the Archduke ALBERT, who ruled the Netherlands, he remained. He received the appointment of Court-painter in 1609. Then he married, built the big house which is known to all visitors to Antwerp, and settled down to enjoy his honours and to acquire wealth. But he did not desert diplomacy. From his fame as a painter he possessed opportunities which were denied to the ordinary diplomatist, and he contrived to serve the interests of his sovereign as well as his own in Paris, Madrid and London. CHARLES I. gave him many commissions, and bestowed a knighthood on him. PHILIP IV. of Spain was no less liberal. The widowed MARIE DE MEDICIS ordered from him for the Luxembourg the allegorical series which is now in the Louvre, and of which no man can decipher the meaning. RUBENS was also accepted as the adviser-in-chief of wealthy amateurs, like Lord ARUNDEL.

The pictures of RUBENS are so numerous it is not easy to imagine how he could find time to execute them. His life lasted for not more than sixty-three years, and barely a half of it was devoted to art. It is true he would have the aid of most able assistants, but the larger part of each of his masterpieces displays the undoubted strokes of the giant's hand. In Antwerp and Brussels there are many of his paintings, and a public gallery is supposed to be incomplete from which examples of his scriptural and mythological works are absent. But to have a *coup d'œil* of RUBENS it is necessary to visit the Munich Gallery. There his versatility and power become more amazing than elsewhere.

RUBENS's first wife died in 1626; four years afterwards he married HELEN FOURMENT, a girl of sixteen, who was most useful to him as a model. In his picture in the church of St. Jacques, Antwerp, where he was buried, he has introduced both women as well as his father. He died in May, 1640, and few painters were able to leave so large a fortune.

ELECTRIC TRAMWAYS.

By F. J. WARDEN-STEVENS, A.M.I.E.E.

(Continued from page 196.)

NOW that the chief systems of traction have been described it may be of interest to consider the details of various electric systems, giving descriptions of typical tramways.

Accumulator Traction.—The use of accumulators as reservoirs of motive power for driving tramcars has been neglected in this country, and is usually dismissed by referring to some of the early failures at Birmingham, Barking and elsewhere. The use of accumulators is the simplest form in which electricity can be applied to the propulsion of any vehicle, except perhaps on an enclosed railway, and the least expensive for street work when the traffic is not heavy. There is the difficulty—not an insuperable one—that accumulators have not proved a brilliant success. Now it is well known that in the last few years, great improvements have been made in accumulators, and that many very able men are at the present time engaged in the production of a suitable traction battery. The requirements are very severe. The accumulators must be light, and at the same time be robust. They must not be seriously injured by vibration or by heavy discharges. As the plates must be thin there is great difficulty in keeping the conductivity of the plates high enough to insure that they will be charged and discharged fully and evenly; the shedding of the active material due to "washing" and vibration is very serious, especially on the peroxide plate. However, even at present there are some successful accumulator tramways.

The Paris Tramways Company in 1892 experimented with accumulator tramcars on the St. Denis-Madeleine line, and the results were of such a nature that horse traction has been gradually superseded over their whole route. The success of this example is very gratifying, because the conditions are by no means easy, and are certainly not very favourable to the accumulators, as there are some stiff gradients to mount. The accumulators used until lately were entirely of the chloride pattern, *i.e.* the active material is obtained by the reduction of the chloride

of lead to spongy lead for the negative plate and peroxide of lead for the positive.

The battery for each car consisted of fifty-six cells, with nine plates of 20 cm. square, the total weight being 1,700 kilogrammes=1.7 tons (approx.), (older batteries weighed 3.0 tons). The method of putting the cells into place has lately been altered, as originally the cells were made up in boxes of 5, and these boxes were placed under the seats from the outside of the car. This method has much to recommend it; the weights to be lifted are small, in-

STATUE OF RUBENS, ANTWERP.

dividual cells may easily be examined and bad ones replaced. The cost of handling is, however, high, and the space required for the charging shed is large. With the newer type of battery the arrangement is to place the whole of the fifty-six cells in a case which is slung underneath the cars. This method is somewhat similar to that used with the London electric cabs. The battery can thus be attached from the car in from two to three minutes. The arrangements that have been described so far are ordinary, and typical of many experimental cars in use.

Lately a new form of accumulator has been introduced on one of the Paris lines which has altered the whole system on that line. The Tudor accumulator is used, *i.e.* the simple Planté type, the plates of which have been specially constructed to have an enormous surface. These batteries are not specially light, the active material being the merest skin on the surface of the plate, and the grid very heavy. However, as the active material is backed up by the conductor so well the efficiency of the active material is high. These cells are suited for extremely rapid charging, in fact, 20 minutes is sufficient for a full charge.

There is at each end of the line a contact pillar, to which the accumulators are connected for 10 minutes. This 10 minutes charge (at a very high rate per cell) is sufficient to run the car to the other end, where it is again charged for 10 minutes. This, therefore, renders removal from the car unnecessary, and the 10 minutes' wait at the end of the journey is the usual one. Although the current is very high, the charging current per square foot of surface is an ordinary one, as the surface is so enormous. The discharge rate per square foot is remarkably low, as the cells which are charged in ten minutes are discharged in about 50 minutes. For these reasons the cells should have a long life, and there is no doubt that a great advance in accumulators for traction has been made. Electric tramway working becomes simplicity in itself with this system, and the results of a year or two's work will be awaited with interest.

A great point of novelty in the general systems of working at Paris, however, is in the motors and brakes. The motors are of the shunt type, working the axles by means of a single reduction gear. The object of the shunt motor is that on running down an incline it will charge the accumulators, working as a dynamo, and this will act as a brake (a series motor would not do this charging successfully). The result of this is that after mounting a heavy incline the cells get a good charge when going down the other side, which must prolong their life considerably. This recuperation of the cells is on the St. Denis line one-sixth to one-fifth of the amount of discharge, and is a strong point of the system, and to it no doubt a great part of the success is due. The shunt motors are wound with extra strong fields in order to get a heavy starting torque, and when the speed is got up resistance is gradually taken from the armature circuit; this is necessary to prevent the rush of current through the motor at slow speeds. As there are two motors on the car they are controlled in the usual way by paralleling the fields and putting the armatures in series for starting.

When we consider the question of accumulator traction in a general way, the disadvantage that the car has to carry, not only the motors but also the accumulators, in addition to the passengers, makes the actual consumption of energy per car-mile high. For instance, on the Paris Tramways the weight of the car is about 14,000 kilogrammes, complete with motors and all accessories; the battery weighs an extra 3,000 kilogrammes, bringing up the total weight to 17,000 kilogrammes (about 17 tons), while the 50 people only weigh 3,500 kilogrammes ($3\frac{1}{2}$ tons, approx.). The ratio of weight of people to total would thus be $\frac{3,500}{20,500}$ in the case

of accumulator traction, this being equal to one-sixth of the total. In the case of a trolley car the weight of the whole arrangement, including passengers, could not be less than, say, 17,000 kilogrammes; thus the ratio would be $\frac{3,500}{17,000}$ = one-fifth of the total. It thus appears that the difference in weight is about equal to that of the passengers, in favour of the trolley.

Coming to the efficiency of the accumulator compared with the trolley system. In the former the losses after

the current leaves the dynamo are as follows:—1. The loss in charging the accumulators. 2. The loss of energy in the accumulators while standing. 3. The inefficiency of the discharge. 4. The loss in the motor. 5. The extra friction due to the weight of battery, and heavier built car needed. In the latter (trolley) the loss in the line and the inefficiency of the motor and gear have only to be considered.

The total losses 1, 2 and 3 average altogether 35 per cent. loss, so that 65 per cent. of the original energy reaches the motor. The loss in the motor and gearing (efficiency 70 per cent.) brings the efficiency down to $\frac{65 \times 70}{100} = 45.5$

per cent. at the axle, and the extra friction due to the battery will bring the efficiency down to say 38 per cent. at the axle.

In the case of the trolley the efficiency of transmission to the car rarely exceeds 80 per cent.; the efficiency of motor and gearing being 70 per cent., we get a total efficiency of 56 per cent. at the axle.

The cost of working of these Paris cars, spread over two years, came out as follows:—

	Cents.
Maintenance (10 c.) and attendance (6 c.) per car-kilo. ...	16
Motive power	18
Wear and tear of trucks and motors... ..	15
Labour... ..	8
Centimes per car-kilometre	47
Cost equals 8d. per car-mile (approx.).	

This is a saving of 30 per cent. over the operating expenses for horse traction on the same lines.

There are several details which are worth considering, and which tend to make or mar any accumulator system of traction. The permanent way must be kept in good condition, otherwise the excessive vibration set up will make the life of the accumulators very short. It is advisable to suspend the batteries from springs attached to the framework rather than to put them on the car. The strong springs on the car do not prevent shocks to the battery as well as the weaker springs required for the batteries only. A point worthy of consideration is that of the method of charging the batteries. This is nearly always done in parallel, and with this method the charging of many batteries cannot be carried out conveniently if one voltage is used. With ordinary batteries a large resistance must be put in circuit at first to keep down the current, and this must be taken out gradually as the voltage of the battery rises. It is obvious that considerable attention is required to keep the voltage constant under these conditions. A better arrangement is to have three voltages, each sufficient for one-third of the charge; the cells can then be plugged on to these in succession, thus preventing waste in resistances.

A still better arrangement is to use a battery which will stand the heavy current at first, and thus have only one voltage. By this means the current will be automatically reduced, as the voltage of the battery approaches that of the dynamo. All that is necessary is to plug the battery on to the dynamos, and take it off when sent out. There will be no excessive gassing if left on for days if the dynamo voltage is the correct one for the number of cells used, as the current will be reduced to almost nothing when the battery is fully charged. The current going into the cells is thus a measure of the state of charge of the battery. There are, however, very few batteries that will stand this charging at constant potential, but still there are some, for instance, the cell mentioned earlier.

Enough has been said to prove that the subject of accumulator traction is not one to be passed over, as it often is, by a few remarks as to the want of success in the past.

(To be continued.)

The Architectural Association will hold its annual general meeting on Friday, October 8, at No. 9 Conduit Street, W., at 7.30 P.M., when Mr. Hampden W. Pratt, F.R.I.B.A., will deliver his presidential address, and distribute the prizes, medals and certificates. The drawings submitted in competition for the various prizes offered by the Association will be exhibited; also students' drawings executed in the studio and school of design during the past session. The classes, which are held at 56 Great Marlborough Street, commence on October 11, and the studio reopens on October 12, at 6.30 P.M.

CHURCH BELLS.

THE last forty years, writes a correspondent of the *Times*, have witnessed the rise of an antiquarian hobby which concerns itself with church bells and more especially the few Mediaeval bells which still hang in church towers or lie cracked on belfry floors. The ancient founders cast very fine-toned bells and adorned them with elaborately moulded inscriptions and devices. But, though our churches have been noted and described in numberless publications, the bells till quite lately received little notice and were too often neglected in every sense of the word. The compiler of one of the latest accounts of the church bells of a county records that belfry keys were constantly handed to him with the friendly caution, "I'm afraid you will find a great mess up there, but, to tell you the truth, I have never been up myself."

The Mediaeval bells usually bear inscriptions, very commonly in rhyming leonine hexameters, pious invocations, or staves in honour of their supposed beneficent powers. The oldest founders rarely put on the bells their own names or the dates; but most of them have been identified by the foundry-stamps and other devices with which they ornamented their works. Large bells were introduced in England about the sixth century, the earliest founders being monastic. Dunstan concerned himself with bell-founding. The Croyland Abbey ring, cast by monkish experts, perished by fire in 1097. A manuscript in the library of Corpus Christi College, Cambridge, contains directions for bell-founding, by a monk of Evesham in the time of Henry III. The modern art of "change-ringing," which took its rise in the seventeenth century, led to rings of eight and even twelve bells being hung in some towers; but in very early times cathedral and abbey churches often had rings of heavy bells, and some of the oldest surviving parish churches, such as Brigstock and Brixworth in Northamptonshire and Bene't Church in Cambridge, were evidently designed to hold several bells. Change-ringing somewhat tended to rescue the bells from the neglect and disesteem into which they had fallen after the Reformation, but it also led to the disappearance of many Mediaeval bells, as ancient heavy bells were recast into smaller ones of larger number. Moreover, the oldest bells, being "long-waisted" in shape, were for that reason frequently made to give place to shorter ones, which the ringers deemed easier to raise.

The Mediaeval bells now surviving are comparatively few in number. In Surrey, out of 1,030 bells, only a trifle over 2 per cent. were found to date before the year 1600. In Lincolnshire the proportion was 17·5 per cent. In Norfolk about one bell in six dates before the reign of Queen Elizabeth. The monastery bells seem to have vanished when the monasteries were suppressed. Some disappeared in private hands; others were sold by the Crown. The Augmentation Rolls show that in Henry VIII.'s reign one lot of 100,000 lbs. of bells and bell-metal was sold for 900*l.*, with license to "convey, utter and sell" the same beyond sea. A very few monastery bells still hang *in situ*. Forde Abbey, in Dorset, still possesses one of the old bells, cast by the Brasyers, who had a foundry at Norwich about the fifteenth century, bearing their foundry stamp and a handsomely moulded invocation of St. Margaret.

The parish church bells were inventoried and valued under commissions about Edward VI.'s time, and some may have disappeared by private dishonesty, but such instances were probably few. Between that time and this the greater part of the old bells have disappeared from various causes. Many were sold from time to time, as money was needed for repairs, or even desired for secular purposes. At Norwich, in Queen Elizabeth's time, the Dean and Chapter were selling bell-metal wholesale. The Corporation were also selling parish church bells. Three Devonshire parishes gave away bells in aid of making a harbour, and the parishioners of a Lincolnshire village sold two bells and spent part of the money in scouring out their haven. Very many bells disappeared in the neglectful times of the eighteenth century. Five bells were sold from Salisbury Cathedral in 1777. King's College, Cambridge, sold several large bells in 1753. When such corporations made merchandise of their bells parishes were hardly likely to be more scrupulous. Bells were sold by incumbents, churchwardens and parishioners, sometimes with faculties, sometimes without, sometimes to save the making of rates for church repairs, sometimes for purely secular purposes. Strange and almost incredible things took place. Stories and traditions linger of bells stolen from churches. The people of a Hertfordshire parish are recorded as divided in their minds whether their ancestors sold a missing bell to a certain other parish, or whether the people of a third parish stole it. So little respect was paid to the bells that in a parish on the south coast smuggled goods were regularly hidden inside them, lashed fast to the clappers.

Many bells, old and new, have been, and still are, wrecked by careless and unskilful ringing, and, notably, by the slovenly habit of "clocking"—*i.e.* tying a cord to the clapper and jerking it against the bell in a manner which checks the

vibration. Two Mediaeval bells still lie cracked on the floor of a west country belfry, broken by lads who got into the belfry and hammered on the bells with heavy blows; nor is this a unique instance of such vandalism. And in our own day many noble old bells as well as many beautiful old churches have perished unnecessarily in over drastic and destructive restoration.

Although the oldest English founders very rarely dated their bells, a few instances exist to the contrary. Lancashire possesses a dated thirteenth-century bell, and Lincolnshire one dated 1323. A Sussex church has or had a bell by a Low Country founder, dated 1369. The Mediaeval English founders turned out such fine bells that there was small temptation to employ foreigners. In Scotland foreign work is less uncommon. A few bells of a Mechlin founder have been found in England, and one of these, hung in a bell-cot on the roof of a tiny seaside church in Gower, misled a popular author into supposing that a foreign foundry had existed in that secluded corner of Glamorganshire.

Norwich, Salisbury, Reading (and Wokingham hard by), Gloucester, and other English places had bell-foundries in the Middle Ages. London from early times was the home of a long series of founders, belyetters and potters, as the bell-makers were variously styled. Billiter Street in the City owes its name to them. Nearly all the London bells perished in the Great Fire of 1666, but the fine church of St. Bartholomew, Smithfield, still possesses a ring of five, adorned with saintly invocations and the device of Thomas Bullisdon, who was casting bells in London about the year 1500. Some of these craftsmen cast cannon as well as bells, in sign whereof a founder at Bury St. Edmunds used a foundry-stamp bearing both a bell and a cannon with a ball issuing from its mouth. The Brasyers of Norwich stamped their bells with a shield charged with three bells. William ffounder, a London founder, whose patronymic was Dawe, used a chevron between three ewers or lave-pots, as well as a bird device which may have been meant for a jackdaw. He cast guns for Dover Castle in 1385, and his bells reached Dartmoor and Cornwall. The Whitechapel Foundry, now carried on under the style of Mears & Stainbank, has been worked uninterruptedly for over three centuries under a succession of founders, beginning with R. Mot in 1570.

Bells cast after the Reformation no longer bore inscriptions invoking saints or claiming supernatural powers. The handsome and elaborate Lombardic capital letters were discontinued, and the black letter soon followed. Since then inscriptions have mostly been in plain Roman capitals, with founder's name and date, to which came to be added the names of churchwardens or parson. In the seventeenth century the inscriptions often degenerated into poor and irreverent doggerel, such, for instance, as that on the tenor of Bene't Church, Cambridge:—

This bell was broake and cast againe as plainly doth appeare
John Draper made me in 1618 wich tyme chvrchwardens were
Edward Dixon for the one whoe stode close to his tacklin
And he that was his partner there was Alexander Jacklyn.

Twenty counties, nineteen English and one Scotch, now possess printed accounts of their bells and the founders, with illustrations, from rubbings and "squeezes," of the surviving Mediaeval inscriptions and devices.

A recent revival of the art of scientific ringing, coupled with this antiquarian cult of ancient bells, may warrant the hope that the bells will now be more skilfully handled and better cared for—that parish idlers will no longer be allowed to crack them with random jangling, much less batter them to pieces. It may be hoped also that fine old Mediaeval bells will no longer be ruthlessly and needlessly recast. Sales of the bells, such as those which took place in the eighteenth century, should be no longer possible. Yet not many months ago a Mediaeval bell belonging to a small country parish was discovered in a neighbouring railway goods shed, presumably on its way to be sold, to find money for some church repair. Happily the bell was intercepted, and returned to its parish. There is ever some evil out of good and good out of evil. Of late years jubilees and other joyful commemorations have been responsible for the needless recasting of many fine Mediaeval bells. If, as we now so often hear, funds for necessary church repairs are hard to come by, there may be the less temptation to spend money in unnecessarily exchanging old bells for new ones. Lastly, whenever an old bell has received injury which renders recasting absolutely necessary, it is possible to preserve the inscription and foundry marks in the form of a circular ring cut from the bell. In this manner some very fine inscriptions have been preserved, and whenever a Mediaeval bell must be recast there is no reason why the inscription should not be thus saved and hung, as a candelabrum or otherwise, in the church itself.

The First Ordinary Meeting of the Liverpool Architectural Society will be held at the Law Library, Union Court, on Monday, the 4th inst., at 6 P.M.

NOTES AND COMMENTS.

FROM the peculiar system of responsibility for the conservation of French churches, it would appear as if accidents are to be expected more frequently than in the past. We have lately recorded some cases where buildings collapsed because they were not watertight. Another is to be added. The church or chapel of Gardes, near Cholet, in the diocese of Angers, is a favourite place of pilgrimage. A fortnight ago it was crowded by Vendéans, who came to assist in the annual solemnities. Fortunately the visits do not continue beyond a week, for on Friday last the vaulting in front of the high altar collapsed. Luckily the building was empty at the time, or the sacrifice of life might have been considerable. It is supposed the rain had entered through fissures which were neglected. Apparently there is no fund available for the restoration of the building, and it will be necessary to beg for money. Yet the chapel is supposed to be national property.

It is to be regretted that the arrangements between the French and English Governments concerning the exhibition of 1900 are not completed. There was lately a rumour that the negotiations were satisfactorily settled, but as yet there are no signs of any definite conclusions. The obstacle is the partition of the areas. England, of course, would have its section on a scale that would do justice to the variety of objects which would be contributed. But most other countries are no less ambitious. France can hardly be expected to sacrifice itself on so important an occasion, and the claims of Russia to a preponderating space must be respected. Meanwhile time is running on, and some departments are expediting their own work regardless of the delay elsewhere. The Minister of Commerce, for instance, has decided on the jurors who are to examine all objects offered for admission. The list will be equal to a good-sized volume. But as Englishmen have had to stand aloof until the Foreign Office gives the signal for action, it is not impossible that the English jurors will be fewer in number than was anticipated, and then the usual outcry about unfairness will be heard.

It is difficult for laymen to understand why there should be marked differences between the estimates of architects for the same work. With works of civil engineering there is more correspondence between the figures. But railway works consist in reality of fewer items than have to be considered in estimating the cost of a large mansion or hotel, although the cost in the simple case may be thirty or forty times as much as in the other. Architects can only proceed in their preliminary estimates on insufficient data. Builders, on the contrary, have "quantities" and other information at their service, and yet every week we see remarkable discrepancies in tenders. What can be made out of the variations between architects' estimates was exhibited in a leading article in the *Scotsman* on Tuesday *à propos* of the schemes for dealing with what is known as the North Bridge Improvement in Edinburgh. The city treasurer believes it is the duty of the Town Council to undertake the onerous responsibility of building on the sites which have become available. The *Scotsman* takes the opposite view, and in the first place endeavours to demonstrate that the treasurer's figures are not trustworthy. The architects' estimates are accordingly used as evidence of the incorrectness of the scheme. The writer says:—"What the treasurer speaks of as the valuers' estimate for rebuilding is 211,000*l*. But there is another estimate by the architects who designed the plan for rebuilding over the area. Their estimate is 172,000*l*., and manifestly the treasurer hangs a good deal on them, though he is not unwilling to accept the higher estimate of 211,000*l*. Now, how were these estimates arrived at? The architects went upon the plan of what is called cubing the property to be erected. That is to say, they multiplied the length of the building by the width, and that again by the height, thus getting the number of cubic feet in the building. Then they attached arbitrary prices per foot, varying from fivepence up to tenpence, and we believe it will be found that their valuation works out somewhere about 9*d*. per cubic foot. This was regarded as a rough and not quite satisfactory estimate, and Messrs.

ORMISTON & WALKER, valuers, were asked to make another estimate. They did so on the same plan, and brought out the result at 195,000*l*. This, as will be seen, was in round numbers about 23,000*l*. higher than the architects' estimates. Obviously any such mode of calculation must therefore be of a very doubtful character. But the Corporation, not being quite satisfied, asked the valuers to go into a more accurate method of valuation. They took a corner house. It was measured in detail, and the cost of the various work for rebuilding it amounted to 8,194*l*. The estimated cost of this same tenement by the architects without detailed measurements was 6,164*l*.—a difference of 2,030*l*. It is obvious from this single instance that the architects' valuation is one upon which no corporation or any private individual would rely as absolutely conclusive. Yet almost the whole of Treasurer McCRAE'S calculation depends upon the accuracy of estimates which may be as wrong as those of the architects." If the Corporation insist on premature valuations, they must not expect more than an approximation. Whether the amount put forth as the cost of the building is more vague than is customary, will depend on many considerations. But the majority of people, in common with journalists, cannot understand why architects' estimates should differ, except to a trifling amount, and the conclusion they will draw is, that finance is an architect's weak point, and it is less safe to trust them than ordinary builders.

As workmen are now disposed to take examples from all who are not industrious, and work the fewest hours, we hope those engaged in building trades will not adopt an imitation of the Chinese. According to the report of Consul CHARLES, neither masons nor carpenters begin work in winter much before 9 A.M. In summer they knock off work for a long two hours' siesta in the middle of the day, and at all seasons of the year smoke, drink tea, and rest whenever it suits them. According to the regulations of the Builders' Guild, wages, if the men find their own food, are 18*s* cash (about 5½*d*.) per diem. These wages are supplemented in the case of skilled labourers by their apprentices' wages, which are paid at the same rate. Apprentices are bound for three years, and as evidence of the scarcity of skilled labour it may be mentioned that on many works at least half the men are apprentices. As accidents are frequent in the trade, and especially among unskilled hands, the parent of the apprentice has to give an engagement in writing holding the boy's master free from all liability for loss of life or for injury incurred during the term of apprenticeship, but a present is expected in case of an accident. No interference is permitted, under the rules of the Builders' Guild, with a customer engaging any builder preferred by him. Touting for employment is punishable by a fine, to be fixed in public meeting. No outside firm is allowed to work until it has joined the guild and received a certificate, the fee for which varies. Assistants or foremen who endeavour to obtain business on their own account from persons for whom their masters work are liable to a heavy fine. Masters have to pay the guild at the rate of about one-twentieth of a penny per diem for every man employed by them, to form a fund to meet subscriptions for canal works, &c. A similar tax is levied on assistants to meet the cost of festivals, illuminations, &c. If trouble occurs between a builder and his employes and work is stopped, no other labour can be engaged until all outstanding accounts are settled. Breaches of the rules are punishable by fine levied in public meeting. Attendance is obligatory at meetings called to fix the quota to be paid towards subscription funds. Disputes between masters and men are not allowed in the guild house. They must be arranged in the tea houses or opium shops.

HIGH ALTAR, ANTWERP CATHEDRAL.

THE church of Notre Dame in Antwerp is the largest and the most remarkable of the numerous ecclesiastical structures erected in Belgium during the fifteenth century. On plan it shows a central nave and six aisles, those at the sides being divided into numerous chapels. The tower reaches a height of 122 metres, or about 400 feet, and would be more effective if the original plan of the architect, JEAN AMELINS or APPELMANS, had been faithfully realised.

The high altar is of a more modern character, and is not in keeping with the rest of the building; but in Belgium there are many diversities of style to be seen in the buildings, which are accepted as inevitable. The altar-piece is by RUBENS. In describing it Sir JOSHUA REYNOLDS says:—"This picture has not so rich an appearance in regard to colour as many other pictures of RUBENS, proceeding, I imagine, from there being too much blue in the sky; however, the lower part of the picture has not that defect. It is said to have been painted in sixteen days."

HIGH ALTAR, THE CATHEDRAL, ANTWERP.

LISKEARD CHURCH TOWER.

ON September 23 the Chancellor of Truro (Mr. R. M. Paul), assisted by Mr. Ponting, architect, Salisbury, as assessor, sat at Liskeard to inquire into a petition from the vicar and churchwardens for a faculty to take down and rebuild the church tower.

Mr. Borlase Childs, who appeared for the petitioners, explained that in 1876 a movement was set on foot to restore the parish church, and Mr. Richard Coad, an architect in Sir Gilbert Scott's office, was employed. One of the first points was what should be done with the ancient tower. Mr. Coad reported that for an expenditure of 200*l.* it could be restored. At that time it was impossible to tell its actual condition, but when the roof of the church was taken off it was found that the defects in the tower were most extensive. Mr. Coad then reported that the foundations were so faulty and the damage to the tower so very extensive that it was hopeless to attempt to restore it, and the contractor was directed to do some temporary work with the view at some later date of rebuilding a tower worthy of the parish and the church. In 1890 Miss Pedler died, leaving 1,000*l.* to be applied conditionally to the rebuilding of the tower. In 1894 the vestry appointed a committee to inquire into what should be done with regard to the tower. Some people had called the committee vandals and visigoths. But the inquiry was approached with an earnest desire to do what was right and proper. There was no prejudged opinion as to whether the tower should be taken down or restored. But in 1878 a faculty to rebuild would have been applied for if there had been sufficient funds. Now, Miss Pedler's legacy was available, but under the conditions of the bequest, unless the rebuilding of the tower was commenced within ten years of her death, and an additional sum of 2,000*l.* was raised, it would go to Truro Cathedral. So far as the petitioners were concerned this was in no way a fight for the thousand pounds. It would not be worthy of Liskeard. But the committee felt strongly that if the tower could not be restored, and its rebuilding was a necessity, they would be doing a grievous wrong if they did not take steps to secure the 1,000*l.* given by Miss Pedler towards the erection of a new tower. Mr. Fellowes Prynne, architect, was consulted by the committee, and reported on the condition of the tower. He described it as in a dangerous state and estimated that it could be restored for 700*l.* or 800*l.* But the restoration would not be satisfactory, for the tower would be so altered in character by buttresses that they would not know it again. Very little Norman work was to be seen now and the buttresses would have hid some of that. Consequently the committee came to the conclusion that the proper course to adopt was to build a new tower, treating reverently every stone in the old tower and embodying as far as possible all the features of the old structure. The present tower had been dealt with many times in many ways. On the south side the only Norman work was a few cockleheads, on the west and east sides there was not a single bit of Norman work, and on the north side were three windows of an early Norman period. These windows were the only bits of the old Norman church which could under any circumstances be reintroduced in a new tower, because the rest was rough cobble-work, and once taken down no power on earth could restore it. One other feature, which was distinctly Norman, was the small window which now looked into the body of the church, but originally looked over the roof of the old Norman church which formerly stood there. Next the committee advertised for plans for the new tower, and there were twenty-five competitors. Special instructions were given to those who competed to introduce as far as possible the architectural features of the present tower, consistent with the architecture of the church. Mr. Sedding, architect, was called in to assist the committee, and he selected a design sent in by Mr. Sansom, of Liskeard. In the plans now submitted was introduced every bit of work in the old tower which was capable of reproduction in the new. All the granite work of the new tower would be done with the granite taken from the old; the Norman windows would be placed, one each on the north, west and south sides, and the old Norman arch leading from the church into the tower would be re-erected inside the tower on the north side. At the request of the committee, Mr. Sedding also examined the tower, and reported that it was rent in various directions by cracks, apparently in consequence of defective foundation, and there could be no doubt whatever that the structure was in a precarious condition, and should be promptly prevented from further dislocation or the tower would collapse. Mr. Sedding added that any method short of rebuilding would be temporary only, for the tower needed a foundation, and that underpinning would be attended with considerable danger. He asked the court to grant the faculty because they were satisfied from the expert evidence that the tower could not be properly restored, and that it must be taken down and rebuilt. If it was not rebuilt it would come down of itself and solve the conundrum. It had been suggested that the rebuilding should be in such a form as to be practically a restoration of the present tower. But

anything more abnormal than building up in the twentieth century the replica of a tower commenced in the twelfth century, added to in the fifteenth, sixteenth and seventeenth, could hardly be conceived. Neither could nor would they do it. They wished to see not the replica of a Norman tower, so called, but a tower worthy of the church. People would not subscribe to build a replica of a Norman tower. But if the faculty were granted they would contribute liberally to a new tower, and the money would be raised in no time. He noticed with no small degree of surprise in the *Western Morning News* on the previous day a letter from the Royal Institute of British Architects. Whoever caused that letter to be reprinted went very close to contempt of Court.

The Chancellor: I agree with you that it ought not to have been printed.

Mr. Childs: It was most improper.

The Chancellor: The only thing is we must take no notice of these things.

Mr. Childs knew the letter would not influence the Chancellor's mind for a single moment. If the Royal Institute of British Architects had an earnest desire to preserve an ancient landmark their proper course would have been to send down members to make a careful examination and then oppose the petition. But they had not the pluck to do that. What they had to say, therefore, was not worth discussing, except that it was an unjust attempt to influence public opinion in Cornwall.

Messrs. R. Courtney, joint secretary of the tower committee, and Wm. T. Hancock, vestry clerk, produced minutes and reports, which bore out Mr. Childs's statement regarding the condition of the tower and the action taken in connection with it.

Mr. Thos. Lang, contractor, Liskeard, who carried out the restoration of the church in 1878, said that the foundation of the tower consisted of loose rubble stone, without any masonry whatever. There were numerous cracks in the tower, many having developed during the past twenty years. But for the support of the roof and arches at the north-east corner the tower must have come down before this. It was really leaning against the church. To underpin the tower was an impossibility, but unless underpinned it must inevitably come down. Unquestionably it was impossible to restore it. The walls were in a state of utter disintegration, rapidly falling abroad.

Mr. Edmund Sedding, architect, Plymouth, reaffirmed the opinion expressed in his report. Personally he should rebuild the tower, using every old stone that was possible, and have an entirely new internal tower bonded to the old. He would also alter the form a little, and add another stage to the top. Only that morning he had seen the foundation for the first time. He had never before seen such a foundation. It consisted entirely of stones loosely set, without mortar or lime. The foundation was not capable of carrying the tower, which was bound to come down. On examining the tower that day he found two more cracks, which he had never seen before. In reply to the Chancellor, Mr. Sedding said the tower was worth retaining if that were possible, but it could only be retained permanently by being rebuilt. He advised rebuilding as far as possible on the lines of the tower as it existed at present.

Mr. Childs, in summing up, said if the faculty was not granted, a check would be given to church work in that part of the county, from which it would take a long time to recover.

The Chancellor asked if there was any possibility of a compromise. He did not want to prejudge the matter, but if on going through the evidence he should be satisfied that the tower could be restored and the foundations underpinned, would it be possible for them to erect the tower at the north-east or south-east corner, and restore the old tower?

Mr. Childs said the committee would not entertain it for one moment. Moreover, Miss Pedler's legacy was left expressly to rebuild the old tower, and would not be available for the erection of a new tower on another site. But while the committee would not entertain the idea of having two towers, they would willingly consider any modifications which might be suggested in the plans.

The Chancellor intimated that he would send a written judgment, and the inquiry closed.

The following is the letter referred to, which was sent (1) to the Chancellor of the Diocese of Truro, and (2) to the Vicar and Churchwardens of Liskeard parish church:—

"July 13, 1897.—Sir,—We are desired by the President and Council of the Royal Institute of British Architects to inform you that they, having had the proposed demolition of the tower of the parish church of Liskeard, in the county of Cornwall, brought to their notice recently, have given the matter their careful consideration. They have been supplied with much information and numerous photographs of the building by various gentlemen interested therein. The tower dates from about the end of the twelfth century, and is the only remaining portion of the earlier church, which was pulled down to make way for the present church about the end of the fifteenth or beginning of the sixteenth century. In the opinion of the

Council of the Royal Institute it is badly in need of repair, but there would be no difficulty in making it perfectly sound. The expense would probably not exceed 700*l.*, and might be much less. The Council are, therefore, strongly of opinion that to pull down so ancient a building, and thereby destroy a valuable and interesting chapter of history would be a deplorable mistake, and they protest against the threatened demolition in the most emphatic manner possible. It appears that a recently deceased lady has left in her will the sum of 1,000*l.* for the purpose of building a new tower, and to this, as the Council understands, the further sum of 2,000*l.* is proposed to be added by the parishioners. There can be little objection to the proposed new tower being erected in some other part of the churchyard; indeed, there is good evidence that up to the time of Henry VIII. the church had two towers. Examples of detached towers are fairly frequent, those at Chichester, Evesham and West Walton being, perhaps, the best-known examples. The new tower might properly contain the peal of bells which, owing to the defective manner in which they are hung, have very probably helped to cause the cracks which appear in the old tower. We are desired, therefore, by the President and Council of the Royal Institute of British Architects to say that to pull the old tower down would be not only a great mistake but an act of vandalism altogether without excuse.

"We have the honour to be, sir, your most obedient servants,

"WM. EMERSON, Hon. Secretary,
"W. J. LOCKE, Secretary."

The state of opinion in the district can be judged from the following letter:—

Sir,—I attended the meeting to-day in Liskeard Town Hall held by Chancellor Paul as to the advisability for granting a faculty for rebuilding the tower of Liskeard Church, and after the evidence and facts laid before the court I cannot see how the application can reasonably be refused, or how the authorities of the diocese of Truro can justify themselves for the annoyance, costs and obstruction they have already caused the parishioners of Liskeard. I have not yet seen or heard of any offer to provide the funds to defray the cost of renovating the old ramshackle tower by these antiquarians who evince so much concern for its retention. If I do not mistake them, the parishioners of Liskeard are steadfastly resolved, if they build at all, to build a tower in character with and suitable to the style of their fine old church, with very little, if any, deviation from the plan they have chosen and approved of.

Liskeard: September 23.

C. M. OLVER.

TONBRIDGE, KENT.*

IT has been my privilege to-day to accompany you to the quaint old town of Tonbridge, which is situated on the banks of the Medway and in the very heart of the "Garden of England." In our short ramble o'er hills and stiles, through copse and wood, we have had revealed to us just a little of that rural loveliness which has made the county of Kent so famous. The early history of the town is the history of the castle, for the two are inseparably connected. Regarding the meaning of the name Tonbridge there is still some doubt, for while some agree that it means the "town of bridges"—as centuries ago five bridges spanned the river and its tributaries—others believe the word to be of Saxon origin, from "ton" (a town) and "burg" (a fort). With the advent of William I. (1066) Tonbridge became a centre of great importance. When the Conqueror landed at Hastings he brought with him a horde of Norman nobility, ecclesiastics and others, who for the help rendered had bestowed upon them various manors and livings in England. Among these was one Richard Fitzgilbert, who had considerable possessions at Brionne. To him, it is said, was allotted the "lowy" of Tonbridge. A "lowy" is the district belonging to a castle, manor-house or religious house. In those days the town was little more than the suburbs of the castle, and the inhabitants, probably nearly all retainers of its lord, following their different callings virtually by his permission and existing to support him in his various warlike and sporting expeditions. Subsisting upon the roughest fare clothed in the rudest attire, we read that "within the deep glades of the dense forests surrounding the town the peasantry tended the vast herds of hogs, wearing as their clothing the untanned skins of animals with the hair inwards, whilst around either their neck or arms they wore rings of iron, betokening their servitude to their ruler at the castle." "Let us," says one writer, "try and picture the condition of Tonbridge and the surrounding districts in those far-off days. In imagination let us stand on Bloodshot Hill and view the landscape o'er. The town—such as it was—would be in the foreground, the walls of which, surrounding the houses of the townspeople, would be all clearly distinguished, whilst the many-channelled meanderings of the Medway would streak the landscape in various directions. In the background we should see the towers of Tonbridge

Castle, not then crumbling with decay and mantled with ivy, but erect, gaunt and forbidding; emblematic of the iron-handed rule of its dreaded lords. Away towards Maidstone and Paddock Wood vast marshes rendered thousands of acres useless and unhealthy, and in these vast quantities of wild fowl made their home, filling the air with their weird cries. The remainder of the landscape was comprised of dense forest land, indications of which exist to this day in the names of various spots, such as 'The Forest,' 'Forest Farm,' &c."

I will not attempt to give in detail the history of Tonbridge, but rather a separate account of each of the interesting landmarks which it has been our pleasure to visit, and from the whole we may perhaps be able to picture to ourselves a little of the past. With its castle, its church, its priory, its old timbered houses and last, but not least, its famous grammar school, certainly there are few towns of greater interest. And while we read and think of Tonbridge as in the old world, to-day we see it in the new, not decaying or destroyed, but growing in peace and prosperity; and although modern exigencies may necessitate many alterations and additions, let us venture to hope that this picturesque old town may long retain its valuable and interesting evidences of bygone days. For much of my information I am indebted to works by Hasted, Murray and Measom, and a most interesting and valuable guide to Tonbridge, by Messrs. Stanley Martin and Prescott Row, and "History of the Church," by J. F. Wardmore.

The Castle.

This building, which is supposed to have been erected by Richard, Earl of Clare, in the eleventh century, at one time enclosed six acres of ground and was surrounded by three moats, but little now remains of it except the keep, small portions of the walls and an interior gateway, said to be the finest extant specimen of Norman architecture in this country. The entrance is across a filled-up moat and through the noble gate tower, which is of great size and tolerably perfect. Here we note the excellence of the masonry, the durability of the very soft stone, the holes for the pivots of the drawbridge, much higher than usual, the extraordinary number of perforations in the vault, on the left a piscina marking the entrance to a chapel; above, the state-room and its large and handsome windows, and generally the various mouldings and enrichments, rare in castellated buildings, and showing this to be of the Early Decorative period, 1280-1300.

Beyond the gate-tower is the inner ward; on the left, beyond the modern house, is a wall with fragments of Norman and Early English work, and forming part of the enceinte of this ward is the so-called Norman Mound, on which stood the keep, covering an acre, 100 feet above the river and 70 feet above the court. On its top is a shell of wall which may be Norman. A walk leads from this mound along a thick curtain wall to the upper storey of the gate-tower. Under this curtain is an arch, which seems to have been a water-gate, by means of which boats could be brought from the Medway, along the moat, into the inner ward.

The keep mound was probably the work of Richard Fitzgilbert, who, it is said, acquired the estate in exchange with Archbishop Lanfranc, and established a jurisdiction over the "leuca" or "lowy" of Tonbridge. The later earls added the gate tower and dug the outer moats.

The castle is historically extremely interesting, as having been besieged by William Rufus in his contests with his brother of Normandy. It was captured by King John in his struggle with the barons; and in the reign of Henry III., when it was besieged by his son, Prince Edward (afterwards Edward I.), the town was burnt by the garrison to check the approach of the royal forces.

It devolved to the crown in the reign of Edward II. (1307-27), and subsequently became the property of the Earls of Stafford, afterwards Dukes of Buckingham, until the attainder of the last duke of that family in 1521, when it again reverted to the crown (Henry VIII.). Elizabeth gave it to her kinsman, Lord Hunsdon, from whom it passed to the Berkeleys, and from them to the Vanlores, the last of whom died, without male heirs, in the seventeenth century. It subsequently became the property of Jermingham, Lord Stafford, a representative of its ancient owners.

The lords of Tonbridge were hereditary chief butlers and stewards of the archbishops of Canterbury and attended their enthronisation feasts in great state. At their termination they claimed the right of remaining three days in one of the archbishop's manors—"ad sanguinem minuendam"—a process looked forward to as necessary after the streams of hippocras and malvoisie set flowing in the hall of Canterbury. The earls, however, may have had their own wine-vats nearer home, for Hasted asserts that a vineyard existed at the castle when he wrote, "from which quantities of exceeding good and well-flavoured wine was produced." This was planted by a Mr. Hooker about the middle of the last century, who, while thus appropriating the enclosure, built the present dwelling-house out of the ruins.

* A paper read by Mr. C. F. Partington on the occasion of the visit of members of the Upper Norwood Athenæum.

"We honoured the man for his taste," wrote Walpole, who ought rather to have condemned his vandalism; "not but that we wished the committee at Strawberry Hill were to sit upon it, and stick cypresses among the hollows. But, alas! he sometimes makes eighteen sour hogsheads, and is going to disrobe the ivy-mantled tower because it harbours birds." The present tenant is Mr. C. J. M. Wauton, who conducts a school there, and it is hardly possible to imagine a more healthy, lovely, peaceful spot in which to study.

The Church of SS. Peter and Paul.

Although there is no mention of the town, church and castle of Tonbridge in Domesday Book, which was completed in 1087, it is believed that a church existed previously, as Odo, Bishop of Rochester, held lands in Tonbridge, which were valued at the sum of 20*l.*, and Lanfranc, Archbishop of Canterbury, to the value of 15*l.* It is difficult to say why they escaped valuation in the survey, unless it be that when in the possession of the archbishop and bishop they were exempt from danegeld, and still continued to enjoy that privilege, and therefore, as in numerous other instances, they were not noticed by the Commissioners in their returns. On the disgrace of Odo, these lands were owned by Richard of Tonbridge, a powerful nobleman who came over with William the Conqueror. His grandson, Roger de Clare, Earl of Hertford, founded the priory of St. Mary Magdalen in Tonbridge, and in 1191 by charter gave to the Brethren of the Hospital of St. John of Jerusalem the church of Tonbridge, with the chapel and appurtenances belonging to it, to the use of the poor of that hospital, in pure and perpetual alms. And by another grant he gave and confirmed to them the advowson of this church and the right which he had to it. This was confirmed by Walter, Bishop of Rochester, and Pope Celestine. Pope Clement IV., A.D. 1267, granted license to the prior and brethren of the hospital to take possession of this church as an appropriation on the first vacancy of it, provided that a fit portion from the income of it was assigned to a perpetual vicar serving in it, for his maintenance and the support of the burthens of the church, and they were that year admitted to it. The first nomination of which there is any record was in 1267, when Brother Henry, Master of Sutton, of the Hospital of St. John of Jerusalem, was duly inducted by William de Quinton by the delivery of chalice and key of the said church.

In 1268 it was affirmed that the bishop received an annual pension of three marks from the parish church of Tonbridge towards the revenues of his table. In 1314 it was certified to the king's treasurer, in obedience to the king's writ, that the prior of the hospital possessed the appropriation of this church with the chapels of Schiburne and St. Thomas Martyr, of Capel, worth yearly 90 marks. In a report of Philip de Thame, prior of the Knights of St. John, to the Grand Master in 1338, the value of the church was 120 marks.

In 1508 it appears the bishop received from the vicarage of this church an annual pension of forty shillings. In 1527 the prior and brethren of the hospital demised to Richard Fane, gent., of Tudeley, their patronage of Tonbridge, with all its appurtenances, excepting the advowson and the woods and underwoods, at the yearly rent of 14*l.* In which state the church continued till 1541, when the order was suppressed, and all their lands and revenues were given to the king, and the fee of it continued to the crown, until Edward VI., in his first year, granted both the rectory and advowson to Sir Ralph Fane and Lady Elizabeth, his wife, to hold "in capita" by knight's service. After Sir Ralph's death, Lady Elizabeth Fane, in 1556, alienated the rectory, with its appurtenances, to Henry Stubberfield, yeoman, who sold it to Alexander Colepepper. He also passed it away by sale to William Denton in 1565, whose eldest son, Sir Anthony, died in 1615, possessed of it. He was one of the gentlemen of the band of pensioners of Queen Elizabeth and James I., and was buried in this church; there his monument still remains with the figures at large of himself and wife Elizabeth. After his death it descended to his four nephews, sons of Sir Alexander Denton, who sold this property; to some in districts or tithe wards, and to others as to their own lands only, which accounts for the several lands in this parish which have from that time been exempt from payment of rectorial tithes. But the advowson of the vicarage remained in the hands of the Fanes, who resided at Hadlow Place, till Viscount Vane (or Fane) dying in 1789 gave the advowson among parts of his estates to David Papillon, of Acrise. It is now held by Mr. John Deacon, of Mableton.

The church is an elegant stone structure with a square tower, but both the church and chancel have suffered so much from ecclesiastical changes and the hands of the destroyer that but little real interest remains. The oldest portion now existing is the chancel, which contains two small round-headed windows on the north side high in the wall, and another on the south, at present opening into the vestry; these are probably Early Norman. The church contains some interesting monuments,

especially one sculptured by Roubiliac to "Richard Children, died March 23, MDCCCLIII., aged 83 years."

In the chancel are two recumbent effigies of Sir Anthony Denton and wife.

In the churchyard there is an interesting memorial to Ann Elliot, the authoress. It is an urn-surmounted tomb surrounded by railings close to the wall near the Bordyke exit:—"Ann Elliot, daughter of Richard and Mary Elliot, born November 16, 1743, died May 30, 1769."

The Priory of St. Mary Magdalen.

The priory was founded in the middle of the twelfth century for black canons (Premonstratensian canons) by Roger de Clare, the first Earl of Hertford, and grandson of Richard Fitzgilbert, and was suppressed in 1526 among the smaller monasteries at the instigation of Cardinal Wolsey, to whom it was granted by Henry VIII., in order to enlarge the endowment of his college at Oxford. On July 11, 1337, it was destroyed by fire, but soon rebuilt, a special indulgence of forty days being granted to all who assisted in the rebuilding. The buildings from the foundations were extensive, for in 1337 they included consistory, chapter-house, dormitory, refectory, church, vestry, library and other offices. In April 1840 the last remains, consisting of the great hall and the chapel, were destroyed during the construction of the South-Eastern Railway. In the garden of the old Ivy House (house of the portreeve) there are some large "iron" stones, and among them I discovered two stone coffin lids with carved crosses in excellent preservation, which probably are part of the remains and the only relics of the black canons of Tonbridge.

Timbered Houses.

Old Ivy House, a picturesque old landmark, formerly the house of the portreeve, where in olden times owners of cattle coming into the town were taxed. The house is known to be 450 years old and its oaken beams seem as good as ever. The ceilings are rather low, but the rooms are large and comfortable and from the stoutness of the walls it is evident that the house was built to last.

Old Chequers Inn, High Street, is a quaint-looking old house which bears the strongest marks of antiquity; said to be some 500 years old and once the only inn in the town, now in the possession of the Colepepper family.

Elephant and Castle is a very quaint old building which formerly did duty as a portreeve house.

Tonbridge Grammar School.

The great glory of Tonbridge is its grammar school, which has for a great many years enjoyed a high reputation as a classical seminary. It was founded in 1553 by Sir Andrew Judde, alderman of London, and is under the government of the Skinners' Company, who annually come down to examine the scholars. Sir Andrew, who was a native of Tonbridge, obtained a charter from King Edward VI., and the foundation-stone which is inserted in the wall over the door of the head master's house bears this inscription:—

"This shole made bi Sir Andro Jude, knight,
And given to the compagne of Skinners, Ano. 1553."

During Sir Andrew's lifetime he was sole governor, but upon his death full powers were vested in the Skinners' Company. The endowment consisted of property in the City of London and some land in the then country village of St. Pancras. These sources now contribute a princely income to the school. Sir Andrew Judde's orders for the conducting of school contained in the original statutes are quaint and thorough.

As regards the master, it provided that he be elected by the Skinners' Company, and that he receive a quarterly salary of 5*l.*, rent free. It also stipulates, among other matters, that he be chosen "for his learning and dexterity in teaching, as also for his honest conversation and for right understanding of God's true religion now set forth by public authority, whereunto he shall stir up and move his scholars, and also shall prescribe to them such sentences of Holy Scripture as shall be most expedient to induce them to godliness."

It also provides against both the master and his usher, whom the former appoints, being "a common gamester or haunter of taverns." It prescribes that the hours of study be from 7 A.M. to 11 A.M., and from 1 P.M. to 5 or 6 P.M., according to the time of the year. The statutes are subscribed by Arch. Parker and Dean Nowell, the latter of whom suggested various alterations, one of which was no doubt much appreciated by the sixteenth-century boys. The original rules provided that no "remedy for playe" should be allowed "above flower tymes in the yere." To this Nowell, who had been a boy himself once, inserted in the margin the words that "Leave to play once a weeke may well be borne with."

An institution of the original school was the "Common Box," a receptacle made of iron with a heavy handle, and with the arms of the Skinners' Company on two of its sides. It was virtually a big money-box, into which a boy, upon his admission to the school, deposited sixpence for the use of books, and into

which fines of various descriptions were placed. Should a boy be absent without leave his delinquency was reduced to a monetary value, and the "Common Box" received his fine; another of its uses was when an extraordinary "remedy" was granted. A "remedy" was an extra holiday, and once a fortnight was the limit for these "remedies," but if some eminent visitor asked an extra "remedy" for the lads, provided it did not occur more than once in the same week, it was granted. But supposing such a request was tendered more than once in a week the "offender," that is the one who made the second application for a holiday, was mulcted in a fine, and the "Common Box" became the richer by the sum of three shillings and fourpence.

In the old days the boys attended service in the parish church, but in 1859, when Dr. Welldon was headmaster, a chapel to seat about 200 was built in front of the school. When the Rev. Joseph Wood became headmaster he extended the work of the school, and at his house and at the residences of some of the assistant masters boarders are received. The number of scholars so increased that it was found impossible to accommodate them in the chapel, so an iron one was erected, to which an extra aisle has since been added. The old chapel is now a museum. July 28 is known as "Prize Day" and "Skinners' Day." The prize compositions include English verse, Latin verse, Greek verse and English essay; and at the distribution of prizes the Master of the Skinners' Company, who is governor of the school, gives an address. The Rev. Joseph Wood is aided by thirty assistant masters, and in no school probably can more practical knowledge be gained. In 1833 the number of boys in the school was 100. Under the present headmaster the number of scholars has risen to the unexampled total of 400. Long may it continue to flourish.

Sir Andrew Judde died in September 1558, and was buried in St. Helen's, Bishopsgate, where a monument exists to his memory.

DESIGN IN LETTERING.*

THE subject of the course of Cantor Lectures I begin to-night is really the relation of lettering to design. "Art in the Alphabet," that should have been my title; it would have conveyed, I think, better than "Design in Lettering" the actual task I have set myself, which is to discuss the subject of lettering from the point of view of art, and only from that point, for it is the only one from which I have any right to speak.

I shall have, of course, to refer to the archæological and palæographical sides of the question; but I promise you it shall be in the briefest possible words, and I wish here, once for all, to make it clear that I lay no claim to the slightest authority on anything but the point of view of design—and even on that point I wish it to be understood that I am not presuming to lay down the law to artists, but only expressing my individual opinions. I do not wish even the younger members of my audience to attach more weight to my words than may be due to the interest I have always taken in this subject and the years I have given to its study. It suits my temper best to speak my mind frankly and unguardedly—and I don't want anyone to think that my most uncompromising assertion means more than that, that is precisely how the thing strikes me.

"Design in lettering!" We are bound to assume that, in the first instance, there was none. The alphabet was not designed, it grew. Precisely whence it came it would be rash to say—palæographers differ—but there is no doubt it came from the East as all culture did.

The Phœnicians, it used to be said, first invented alphabetic writing. They were, as everyone knows, the traders of antiquity (as we ourselves are the traders of to-day), and no doubt they spread the art of writing over Europe. But neither is there any doubt that the Egyptians were before them, to say nothing of the Chinese. The Chinese apparently arrived, quite independently of the Egyptians, at an alphabet of their own. Those, however, who should know best seem to agree in thinking that Egypt led the van. Certainly it showed Europe the way.

The letters of the alphabet are neither more nor less than symbols of sounds. Writing was in the first place figurative—that is to say, picture writing.

Drawing, in fact, preceded writing, or was the form writing first took. Primitive man knew no other way of conveying the notion of man, beast or thing than by making a rude sketch of whatever it might be. That, then, is the first stage of writing, the figurative—a simple but rather cumbrous way of recording speech, of transmitting it, that is, by glance of eye instead of word of mouth.

From that merely figurative writing to symbolic expression

is but a step. It requires no great stretch of the imagination to let, we will say, the sword stand for war, the pipe for peace, the lion for courage, the skunk for cowardice, and so on.

Not that I mean to imply that these particular symbols were used in this sense by the Egyptians; I refrain purposely (in my entire ignorance on the subject of Egyptology) from pretending to say the sense in which they used the familiar signs of vulture, beetle, serpent, and so on. It is enough for our purpose that, by the acceptance of images such as these as symbols, it first became possible to convey in writing abstract ideas.

The stock of ideas which could be so conveyed was, in the nature of things, limited; you could express a fortified town by a tower—but what town? Moreover, when once a thing stood for an idea, it became necessary to distinguish between the representation of it designed to express that idea, and the representation of it to express merely the thing itself. How was the reader to know whether by a serpent the writer meant eternity or simply a reptile? It is conceivable that a polite note asking for the loan of a hatchet might be taken as a declaration of war.

As the best symbolic writing could appeal only to people who had ideas in common—it would puzzle one to-day to invent a symbol which should convey to the Italian tradesman a notion of what we mean by "fixed prices"—the wider the dealings of a people, the more they would feel the need of some more elastic means of expression. How for example to express proper names, or things not readily distinguishable by the eye—say sugar from sand, glass from precious stones—and so with many a commodity in which a trade might be carried on. (There is an ominous sound about the word "trade"—but we must give it its due—and there is no doubt it is largely responsible for the spread of so much culture as may be implied in the use of written language.) Well, this need of more elastic expression—ever more and more pressing—was supplied by the use of signs to express, not merely things, no longer even ideas only, but sounds. There, with signs for sounds, begins a really scientific system of writing.

How man can possibly have conceived the idea of devising such a system is more than one can understand; the daring of it is tremendous, but of course its originators had not the faintest notion of the perfection to which in the course of ages it was to be carried. It began after the manner of things destined to take root modestly, and for a while the alphabet, though phonetic, was still pictorial.

The new departure consisted in making a sign stand for the sound of a word, and no longer for the word itself. It so happens that in the language of all primitive peoples words are usually monosyllabic—it was so in Egypt; a sign therefore stood for the sound of a syllable, and eventually for the first part of the sound, for the first letter of it, in short. It is as though they had started with the notion that "A was an archer," or rather that an Archer should be A, and so forth through the alphabet, no matter whether it took 16 letters or 52 or 500 to express the sounds employed in the language.

An archer answers very well for A—but the delineation of the archer makes demands upon powers of drawing with which not every one is gifted, and in any case it takes time. Why not, therefore, represent the archer by his bow: that is easily drawn, and not easily to be mistaken? Similarly, if the ox stood for O, or the stag for S, the beast might just as well be suggested by his horns only—and so on to the end of the alphabet.

Writing is always a sort of shorthand: inevitably the signs are reduced to their simplest expression, become mere signs, as unlike the thing which may have suggested them as a man's signature—which is yet honoured by his banker. Enough if it conveys that what we are meant to understand; the business of a letter is to convey a definite sound.

We arrive, then, by an obvious process of "degradation," as it is called, of natural forms, at an alphabet of practically quite arbitrary sounds, the alphabet as we know it and have known it for a couple of thousand years and more. (I don't quite know why we should call it degradation—"fit treatment," "natural selection," I should rather call it.)

You must bear with me for a few moments whilst I endeavour to trace back the characters we use to their origin.

We know them, in a sense, so well that we never think to ask ourselves what they mean or how they came to be. But it is of no use attempting to discuss the letters we employ without realising first of all how we came to employ them; rightly to understand their forms, we must understand how they came about. The story of their evolution should be interesting. At all events, it is an essential part of our subject.

We get our alphabet, as you know, from the Romans. We speak of it to this day as Roman, to distinguish it from Gothic or black letter. The Romans got it from the Greeks, or, if not precisely that, from the same sources whence they derived theirs.

What we know for very certain is that the Greek, Etruscan, and old Roman alphabets are all very much alike. They resembled one another, that is to say, in the number of letters they contained, in the sound-value of those letters, and in the

* Abstract of a course of Cantor Lectures, by Mr. Lewis Foreman Day, published in the *Journal of the Society of Arts*.

form they took. These letters were originally only sixteen in number; and that seems to have sufficed always for the Etruscans—the race died out before ever it had need of more. The Greeks, it appears, grafted on to the old Pelasgic or native alphabet (whencesoever that may have been derived) certain new letters necessary to express new words (involving new sounds) which they borrowed from the Phœnicians. Naturally they took those letters from the Phœnicians also. These same Phœnicians probably adopted from the Egyptians signs sufficing to express the sounds in their own language—without caring or knowing perhaps anything about the pictorial origin of such signs. They accepted them as so many arbitrary expressions of sound-values; and there was nothing in the world to prevent their modifying them, therefore, until they had reduced them to the very simplest and most convenient form of expression. That is what they did. And so it comes about that we to-day appear to be directly indebted to ancient Egypt for at least some part of our alphabet, far removed as it may be from the hieroglyphics of the Pharaohs. But that is by the way, as well a long way off. For our present purpose we need not go further back than to ancient Greece.

The Greeks had no longer (as the Egyptians had) any signs to represent syllables, that is to say, combinations of vowels and consonants; but they retained certain compound consonants, most of which they adopted from the Phœnicians. These the Romans dropped. At first they used, instead of them, the two consonants *ch*, *ps*, which expressed as nearly as possible the equivalent sound of the Greek *χ*, *ψ*, and so on.

And then, perhaps, they devised a single letter for a sound which until then had been expressed by two—*F*, for example, instead of *Ph*, *Q* instead of *Cu*.

The sixteen letters common to Greeks, Etruscans and Pelasgians were *Α Β Γ Δ Ε Ι Κ Λ Μ Ν Ο Π Ρ Σ Τ Υ*. The Phœnician letters next added were *Ζ Θ Φ Χ*. After that we get *H* for *ee*, *Ω* for *oo*, *Ψ* for *ps*, *Ξ* for *ks*.

The early Roman or Latin alphabet differed very little from the Greek. The latest comers in it were *G H K Q X Y Z*. Once printing was established, changes in the form of the type were necessarily very gradual. Possibly they have been, on the whole, in the direction of clearness and legibility. Certainly they have not been in the direction of beauty—which, however, I am bold to contend, is perfectly compatible with sternest usefulness. And we have arrived to-day at a period when everyone is so familiar with the printed page that, although he may be prejudiced against any modification of it, and resent it, there is no danger of his not being able to read it in any improved shape we might devise.

Modern type is based on manuscript forms. Those MSS. forms were modified by the scribes with a view always to ease in writing. Whatever was difficult or took long time to write fell naturally out of use. In printing, that concerns us no longer—one shape is as easy to print as another; and it might be worth while to restore some obsolete features, now that we have not to write the letter. At any rate, I think it is time we looked over the alphabet—took stock of it, as it were—with a view to perfecting it as printed type without too tender a regard to its descent. Letters, like the men who use them, must stand to-day on their own merits.

Our first business with the alphabet is to make it work smoother, to make reading easy. That will be done by developing whatever is characteristic in each letter, by curtailing, and if possible lopping off, whatever there may be in it which allows us to confound it with another. The needful thing is, in the case of each individual letter, to emphasise its individuality, to make it unmistakably itself. And at the same time there is no reason why reading should not be made pleasant as well as easy; beauty has also to be borne in mind. It goes without saying that that must on no account interfere with use, but there is not the least reason why it should. Beauty does not imply elaboration or ornament. On the contrary, the qualities of simplicity, dignity, character, which in the name of art we desire, are precisely the qualities which in name of practicality are equally demanded.

The preliminary, however, to any doctoring of the alphabet, any surgical operation, however necessary, any safe prescription even, is that doctors should understand the patient.

I propose, therefore, not precisely to dissect the alphabet (though it is dead enough), but to explain to you as far as I can the comparative anatomy of lettering, and I have prepared a series of diagrams which I think will enable you better to distinguish what is essential to the letter and what is not. They are not beautiful, but should be helpful.

You will notice the resemblance between the Coptic and the Greek letters. The Coptic alphabet is, in fact, only a variant upon the Greek. The Copts, you know, were the Christianised Egyptians, and when they accepted Christianity they adopted the Greek alphabet—just as the Turks took the Arabic character together with the Koran—and in the sixth century, when the new faith was firmly established at Alexandria, Coptic writing supplanted the old Egyptian. The Coptic alphabet is therefore Greek, except for seven extra signs, taken from the

ancient demotic alphabet to express Egyptian sounds for which the Greeks had no equivalent.

In its adaptation to Latin language Greek gamma or *G* becomes *C*. *G* is in fact almost equivalent to hard *C*. To the not too subtle ear the two sounds are like enough to pass one for the other—just as soft *C* may be made to do duty for *S*. When *G* came to be used as a separate letter, distinct from *C*, then *C* in its turn was used for *K*—though *K* did not go quite out of use.

There are points of resemblance again between our alphabet and the Runic. Runic is the name given to the writing of the priests of Northern Europe, and especially of Scandinavia. It is no doubt ancient. The legend is that it was the invention of Odin. If so, Odin must have derived it from some ancient Greek or Roman source, if we are to judge by internal evidence. Certainly it was in use from the time of the first intercourse between Scandinavians and Romans. Christianity forbade its use, and with the triumph of Christianity it passed out of currency. But it affected our Anglo-Saxon writing somewhat.

The Greek *H* stands for *EE*; but at the beginning of a word it answered the purpose of the aspirate. The Romans used it for the aspirate only, that is to say, practically just as we use it now, namely, for *H*.

The letter *J* did not exist either in the Greek or in the ancient Roman alphabet. It is equivalent, of course, to *ii*. Place one *i* over the other and you get a long *j*. Eventually the initial developed a tail and became *J*. Towards the fifteenth century the initial *I* was pretty generally written *J*.

The Greek *Υ* (upsilon) becomes the Roman *V*, whence the confusion until quite recent times of the letters *U* and *V*, which, you know, were used indiscriminately. They were interchangeable—you might use one or the other—both, if you liked, in the same sense, in the same word. It was not until the tenth century that the custom arose of reserving *V* for the beginning of a word and elsewhere using *U*.

Ω (omega) stands for *oo*. And in the minuscule form looks like it—shows its derivation; but in the end it is used for *uu*, or *W*. It appears that in some Greek dialects it is used for *ou*. It is quite certain that in the ninth century omega was written precisely like a *W*. And when you come to think of it the sounds are very nearly alike. Take any word beginning with *W* and change the *W* into double *o*, and then try and pronounce it—say, not *WHY*, but *OOHY*. Why, it's much the same thing.

(To be continued.)

THE BATTENBERG MEMORIALS.

A CORRESPONDENT of the *Standard* writes:—‘The committee responsible for the carrying out of the work of erecting suitable memorials in the Isle of Wight to the late Prince Henry of Battenberg, have received a communication from the Society for the Protection of Ancient Buildings which will in all probability retard the work which the committee have in hand. Shortly after the death of the late Prince Henry a committee of leading residents in the Isle of Wight, including the chairman of the County Council (General the Hon. Somerset J. G. Calthorpe) and the Deputy Governor of the Isle of Wight, was appointed to arrange for the carrying out of suitable memorials in or near the centre of the island, the town of Newport. The memorials decided upon were the conversion of the ancient gatehouse and portcullis chamber of Carisbrooke Castle into a museum for the reception of articles of interest connected with the castle and the Isle of Wight. The other memorial was an addition to Carisbrooke Church. Sir Charles Seely, formerly M.P. for West Nottingham, offered 1,000*l.* towards the second memorial, providing that at Carisbrooke Church a chancel should be built on the site of the one formerly said to have existed at the church. The memorial at Carisbrooke Castle is almost completed, and has given great satisfaction to those who are responsible for the work, including the Princess Beatrice, who is the Lady Governor of the Isle of Wight. With regard to the memorial at Carisbrooke Church, the committee of the Society for the Protection of Ancient Buildings has interposed, and the secretary, Mr. Thackeray Turner, has addressed a letter to the secretary of the Battenberg memorials committee on the subject. The committee express the hope that the rumour as to the destruction of the ancient chancel arch is unfounded, as, in their opinion, it would be an unjustifiable act of vandalism. Carisbrooke Church, they point out, is so well known, and was of so much interest to many people beyond the area of the Isle of Wight, that any interference with its ancient character and appearance could only be looked upon as a calamity, and, therefore, the committee earnestly begged that the memorials committee would not give its consent to the destruction of the chancel arch, which was necessarily a record, and an interesting feature of the church. The Society had no other object in view than as its title indicated, namely, the preservation of an ancient building. The memorial has not been so popular with

the island residents as that at Carisbrooke Castle. The action of the Society mentioned has caused considerable comment in the district, and it is quite probable that the committee will be prevailed upon to adopt some other scheme.

CARVED COMMUNION TABLES.

IN the Consistory Court of York on September 23 Lord Grimthorpe, as Chancellor of the Diocese of York, delivered judgment in the case of the Rev. T. J. Miller, vicar of South Cave, who applied for a faculty to erect in that church a carved oak communion table and reredos. The application came before the Court some time ago, when the lay rector and patron of the living, Mrs. Barnard, of Cave Castle, opposed the same. The Rev. T. J. Miller was presented by Mrs. Barnard to the living in August 1895, and, according to affidavits put in, the new vicar undertook not to adopt the eastward position nor yet to introduce a cross into the church. It was suggested that he had not kept his promise, and, with reference to the proposed faculty, Mrs. Barnard objected to the whole reredos, including a proposed cross, because it would, as alleged, partly obscure the east window, of fine old stained-glass which was brought from Holland at considerable cost by one of her predecessors. The substitution of a new communion table was also objected to as unnecessary, the present table being perfectly sound and in good condition and put in by Mr. Pearson as architect when the late lay rector restored the chancel. There was some contradiction as to the design of the proposed new communion table, and the Chancellor said the question was raised whether it was a *bona-fide* table at all. It was quite a mistake to imagine that the decisions against stone tables sanctioned a sham one made of wood. Mr. Prideaux, Q.C., in his "Churchwarden's Guide," doubted their legality. And the Court of Arches in *Bradford v. Fry*, which had never been overruled, disallowed steps round the north and south side of a communion table on the very ground that they made it look like an altar. He himself had always followed that judgment, and meant to do so until it was overruled, and not merely disregarded by some inferior court, or by architects and clergymen unlawfully. The Chancellor severely commented on the conduct of the vicar. He referred to an affidavit by a parishioner, Mr. Cousens, who stated that he had ceased attending the church because of Mr. Miller's practices, to which he and many others objected. He refused the faculty, and condemned the promoter, Mr. Miller, in the costs.

TESSERÆ.

Impressions of Medals.

IMPRESSIONS of medals having the same effect as casts may be made of isinglass glue by the following means:—Melt the isinglass, beaten, as when commonly used, in an earthen pipkin, with the addition of as much water as will cover it, stirring it gently till the whole be dissolved; then with a brush of camel's hair cover the medal, which should be previously well cleansed and warmed, and then laid horizontally on a board or table, greased in the part around the medal. Let them rest afterwards till the glue be properly hardened, and then, with a pin, raise the edge of it, and separate it carefully from the medal. The cast will be thus formed by the glue as hard as horn, and extremely light. In order to render the relief of the medal more apparent, a small quantity of carmine may be mixed with the melted isinglass; or the medal may be previously coated with leaf-gold by breathing on it, and then laying on the leaf, which will by that means adhere to it, but the use of leaf-gold is apt to impair a little the sharpness of the impression. Impressions of medals may likewise be taken in putty; but it should be the true kind, made of calx of tin and drying oil. These may be formed in the moulds, previously taken in plaster or sulphur; or moulds may be made in its own substance, in the manner directed for those of the plaster. These impressions will be very sharp and hard, but the greatest disadvantage that attends them is their drying very slowly, and being liable in the meantime to be damaged.

Burning Glasses.

The invention of mirrors or looking-glasses, constructed probably of polished brass, remounts to a very remote antiquity, as they are mentioned by Moses in the sacred writings. At what period they were employed in a concave form to concentrate the solar rays by reflection is not known, but it is very probable that mirrors of this kind were used to rekindle the vestal fires. Plutarch, in his life of Numa, 700 years before Christ, describes the *σκαφεῖα*, or dishes which were employed for this purpose, and which appear to have been concave segments of a sphere; and he states that the combustible matter was placed in the centre, meaning, no doubt, the focus or centre of

concentrated rays. In the time of Socrates, 430 years before Christ, the manufacture of glass had made considerable progress, and it appears from a passage in one of the plays of Aristophanes that the use of burning glasses was common. The author introduces Socrates as giving lessons in philosophy to Strepsiades, a citizen of Athens, and a man of low cunning. The subjects of these lessons are silly trifles, intended to make Socrates appear ridiculous. Strepsiades, after having asked him how he should avoid paying his debts, proposes the following expedient himself:—"Strepsiades: You have seen at the druggists that fine transparent stone with which they kindle fires? Socrates: You mean glass, do not you? Strepsiades: The very thing. Socrates: Well, what will you do with that? Strepsiades: When a summons is sent to me I will take this stone, and placing myself in the sun, I will melt all the writing of the summons at a distance." The writing, as we know, was traced on wax spread upon a more solid substance. This description must refer to a burning glass by refraction. Several other ancient observations on the same phenomenon exist. Pliny mentions globes of glass or of crystal, which, being exposed to the sun, would burn clothes or the flesh of a patient when cauterisation was requisite. Lactantius, who lived about the year 303, says, "A globe of glass filled with water and exposed to the sun will kindle a fire even in the coldest weather." But the most memorable account of burning glasses and of their effects in all antiquity, and what has excited no small degree of speculation in succeeding times, is the extraordinary achievement ascribed to Archimedes, of setting fire to the Roman fleet engaged in the siege of Syracuse.

Bronze Casting.

The art of the founder naturally underwent all the vicissitudes of the other arts; in the time of Nero the decadence had already commenced, it not being possible to cast the colossal statue of that emperor, modelled by Zenodorus, and which was to have been 110 feet high, although a century afterwards the beautiful equestrian statue of Marcus Aurelius was cast. Falconnet, in comparing these two facts, endeavours to make out a case for an attack on Pliny; but it seems to us that the circumstances may be reconciled by supposing that casting in bronze had been momentarily neglected before the time of Zenodorus, and that they had been more successfully cultivated in the time of Marcus Aurelius, for a similar circumstance happened in our own days. The brothers Keller, under Louis XIV., carried the art of casting in bronze to a high degree of perfection; but under Louis XV. the founders were not so good, and in the early part of the Empire great difficulties were met with in executing works of this kind, whilst now the art of casting in bronze has made greater progress than ever. Besides, it may be said that whenever a process is not carried on scientifically, while the reason of the different phenomena has not been discovered, and the artist consequently is reduced to take the bare results of experience for his guide, the neglect of the art for some time is enough to cause the facts to be forgotten, and the guides are consequently lost. This, however, cannot happen when the theory of an art is firmly based on scientific principles, and the reason of the phenomena is consequently understood; drawing our conclusions, from which we may say that the art of casting in bronze will henceforward never be lost, even should it be neglected for centuries, a few trials would be enough to bring it back to the point at which it had been left.

The Dominicans as Artists.

Of the various religious orders, the Dominican has probably furnished the largest number of artists. This was an order consisting chiefly of men sprung from the upper classes of society, and endowed with superior intelligence. From their ranks have proceeded painters, sculptors and architects, who lent their aid in the production of many most useful and permanent works, not merely in Italy, but in other countries; and the number of these artists is so considerable that the well-known work of Marchese is exclusively devoted to the record of their labours. With these art was a religious exercise. The intervals between the services of the chapel were occupied by the monk in pursuit of his art studies, the illumination of his service-book, the design for a basilica, baptistery, or bridge, or the composition of an antiphonal; and when he returned from singing the mass in the choir of his own church, it was but to resume his occupation on the picture or the illuminated service-book which was to assist in its enrichment. His faith stimulated him in its production, for it was the main object that impelled him to the exercise of his powers. His professional was subordinated to his religious enthusiasm, for he considered that the talents with which he was endowed were only given him in trust, and restricted in their application to one great end—the service of his religion. He came to the exercise of his diurnal labour with humility and fasting, and even bedewed with his tears the subject on which he was employed, invoking the Divine aid, that when completed it might be deemed an acceptable oblation, and

serve at the same time as a grateful acknowledgment of the superior talents with which he had been endowed. When men gave up all temporal preferment, when the regulations of their order supplied all their necessary wants and relieved them of worldly cares, and when their social position was thus rendered distinct from that of other classes of the human family, the same attention which the Church imperiously required from her votary was a condition essential to successful achievement in art; nor was the co-existence of the functions of ecclesiastic and artist deemed incompatible. The profession of fine art was in strict accordance with the spirit of his religious profession; he acknowledged its power to be most worthily applied when exercised in the service of the Church, when he could be the means of supplying symbolic personifications to arrest the attention of the devotee and guard his orisons from the intrusion of mundane circumstance, or when through its agency he could instruct the uninformed mind by means of the pictured realisation of Divine revelation of scripture history. Shut out from the artifices of the world and many of the adventitious circumstances in more recent times disadvantageously attendant on the painter's studio, his life was of that independent nature which is indispensable to the production of any excellence. His paramount responsibility as an artist was to his Church—the vital absorbing principle that controlled his efforts.

Sir T. Lawrence.

Sir Thomas Lawrence was perhaps hindered from rising to the highest rank as a colourist by his early and first practice of making portraits in colourless chalk only. His wish to please the sitter made him yield more than his English predecessors had done to the foolish desire of most people to be painted with a smile; though he was far from extending this indulgence to that extreme of a self-satisfied simper that the French painters of the age preceding his had introduced to portrait. Of indefatigable industry, Lawrence's habit of undertaking too many pictures at the same time was a serious drawback in many cases to their excellence. He began the portraits of children which he did not finish till they were grown up, and of gentlemen and ladies while their hair was of its first colour, but which remained incomplete in his rooms till the originals were grey.

The Accident to the Drury Lane Stage.

SIR,—At the suggestion of Mr. Arthur Collins, the managing director of the Drury Lane Theatre, I venture to encroach on your valuable space in order to emphatically refute the various exaggerated reports still current in regard to the extent of the damage done to the hydraulic machinery on the occasion of the recent accident in connection with the production of "White Heather." No such calamity as the bursting of pipes or flooding of the stage "cellar" occurred, and that the various apparatus employed in the realistic diving-scene had to be seriously brought into requisition can only be treated as an excellent joke. I would also take the opportunity of contradicting the various expressions of opinion which have been freely circulated as to the inadvisability and danger of adopting hydraulics for the working of stage mechanism. The more modern forms of stage appliances are distinctly safer than those of the stage of old, not only in their general working, but also as regards risk from fire.

Having been entrusted with the investigation of the accident which prevented the performance on Saturday week, I may perhaps be permitted to say to those professionally interested in modern methods and appliances that the hydraulic machinery at Drury Lane Theatre comprises two large lifts or "bridges," each measuring 40 feet by 7 feet 6 inches super, and worked by two pairs of rams in such a manner that they can either be raised horizontally or on the slope. The accident in question took the shape of a collapse of these lifts whilst in a sloping position, with the result that certain parts of the mechanism were strained or broken. There is not the slightest reason, however, to assume that the construction was defective, and, after careful research, I unfortunately found it necessary to say in my report to the directors on the occurrence that there was evidence which seemed to indicate that the accident had been brought about either by wilful negligence or malicious damage.

The appliances were introduced by the late Sir Augustus Harris, and were brought over from Vienna, little or nothing having been done in this direction of stage equipment by English engineers. The collapse, however, in no way lessens the discernment of the late manager as to the introduction of modern appliances from the Continent; in fact, the effect produced in the Lock scene in "White Heather" makes many wonder why improved methods and appliances have not long

ago been more generally used on the English stage. Now that a start has been made in the right direction it is to be hoped, however, that sufficient interest will be shown in stage construction to prevent the necessity of sending abroad for machinery of this description.

As to the repairs, which are being executed under my supervision, I am glad to say that, thanks to the indefatigable efforts of Messrs. A. Smith & Stevens, the hydraulic engineers, the first of the two "bridges" is already in working order, and the second will soon be ready, so that what has had to be temporarily done by manual labour can again be worked by water power. That the play could be presented with provisional aids as early as the Monday following the accident is mainly due to Mr. Taylor (the stage machinist) and his staff of carpenters; and in times of continual labour troubles it affords me particular pleasure to notice the brilliant manner in which the carpenters on the one hand, and the mechanics of Messrs. Smith & Stevens on the other, have vied to do their respective work thoroughly and quickly, regardless of the fatigue and inconvenience of successive days of very long hours.—I am, dear sir, yours very truly,

EDWIN O. SACHS.

11 Waterloo Place, Pall Mall, S.W.:
September 28, 1897.

The Acme Wood Flooring.

SIR,—As old patrons of your journal, we write to say in reference to the series of separate "Illustrations" appearing in the present and previous issues of your paper, that our patented system of immovable Acme wood-block flooring (as advertised in your pages) has been laid in several of the buildings included in your series. Thus, amongst others, in your issue of September 10, Messrs. Pawsons and Leafs, Limited, and of September 17 and 24, Her Majesty's Theatre, Haymarket, and the Imperial Institute.—Yours truly, WILLIAM DUFFY.

(The Acme Wood Flooring Co., Ltd.)

GENERAL.

A Protestant Temple is about to be opened in the Boulevard Barbes, Paris. The works have cost about 5,000*l.*, towards which the city has granted 1,200*l.*

The Memorial Statue of the late Dr. Dale will be unveiled in the art gallery on October 15 during the meeting in Birmingham of the Congregational Union. The statue, which has been executed by Mr. Onslow Ford, R.A., will be presented to the city on behalf of the subscribers by Alderman Kenrick, M.P.

A New Hotel is to be erected at Crowborough Beacon, Sussex, at a cost of about 15,000*l.* Mr. Samuel Denman, of Brighton, is the architect.

A Chancel is to be added to Christ Church, Brussels, as a memorial of the Victorian Jubilee. An inscription recording the great event of the Jubilee will be placed in the new chancel as the most appropriate memento of its elevation.

The French Architects who possess diplomas or other claim to be considered "patentées" number 3,241, while the civil engineers holding a similar privilege number only 283. Painters, sculptors and men of letters are among the unprivileged classes.

The Abbé Louis Tosti, Inspector General of Religious Monuments in Italy, has died at Monte Cassino in his eighty-sixth year. Among his works was a history of that famous monastery.

Messrs. Metchim & Son, printers, lithographers, &c., have removed from Parliament Street (where they have been established for half a century) to Abbey Buildings, 8 Prince's Street, Great George Street, Westminster.

An Excursion Meeting of the Northern Architectural Association will be held to-morrow, Saturday, October 2, when the following buildings will be inspected:—Jesmond Parochial Hall, St. Jude's Church (Portland Road), and Shieldfield Board School (Portland Road).

Mr. Alderman Hind was on Wednesday sworn in as Master of the Plumbers' Company, and subsequently Mr. Frederick Machin as Warden, and Mr. Charles Hudson as Renter Warden.

"A London Merchant" has offered 1,000*l.* towards the erection of a residence house for the clergy attached to St. Saviour's Church, Southwark.

On the Summit of a hill, known as How Tallon, Yorkshire, nearly 1,500 feet above sea-level, a barrow, supposed to have been constructed by the ancient Britons, has been opened, and an interesting discovery made. The barrow is 60 yards in circumference and 6 feet high. A quantity of human bones, a stone cist, four flint arrow-heads and a flint scraper were found in the portion dug into. One of the arrow-heads was barbed, the others leaf-shaped, and the edges are serrated and most delicately fashioned. A small pottery urn, with a worked pattern upon it, was found interred with the remains of one human body.

The Architect.

THE WEEK.

THE death of Sir JOHN GILBERT on Tuesday is not a surprise to his friends, but it is none the less to be regretted. At one time his name and, it might be added, his works, attained a popularity which no other artist could rival. Woodcuts from his drawings were to be found everywhere, for not only editors and publishers believed in him, but even the proprietors of quack medicines and other productions found it an advantage to have his aid. There was no essential difference between his drawings on wood and his pictures, except that the latter were coloured. It was, indeed, sometimes difficult to decide whether the woodcut did not precede the painting. He was born eighty-one years ago at Blackheath, and he was faithful in residing there throughout his life. GILBERT was mainly self-taught, but he was only a lad when he began to make drawings for illustrations. In those days he was an imitator of the French draughtsmen. GILBERT did not confine himself to one class of work. He was able to gain admission for an oil-painting in the Academy exhibition in 1836 and for a water-colour drawing in the Suffolk Street galleries. The effect of his experiments in painting was advantageous for his drawings. He appeared in both as an admirer of RUBENS, and in representations of modern commonplace incidents his draperies sometimes recalled the Flemish masters. Mr. INGRAM'S experiment of a weekly illustrated journal gave an unexpected opportunity for JOHN GILBERT'S facile pencil. Without his aid so much success could hardly be attained, for among the men who were then available there was not one who approached GILBERT in expedition and power. His services were not restricted to the *Illustrated London News*. Imitations were set up on which he was engaged, but they were unable to endure. For penny periodicals he also made an amazing number of drawings. There was rarely much difference in the quality of his work, for an illustration of a sensational romance generally possessed as much dramatic effect as one which was prepared for an edition of SHAKESPEARE. There seemed to be no limit to his productiveness, and however hurried he always contrived to express his subject with vigour and point. His paintings were at once recognised, and their dashing qualities were always admired by artists, although the conventionality could not be ignored. His pictorial work fairly entitled him to admission into the Academy and the Water-Colour Society. He exhibited constantly, and it could not be said that his powers were diminished by age. Sir JOHN GILBERT served his generation, and as a faithful servant his death should be regretted.

MR. Chancellor R. M. PAUL has declined to grant a faculty for the rebuilding of the tower of Liskeard parish church. In the judgment which he prepared he says:—"According to Mr. PRYNNE'S report, the existing tower, which is of considerable architectural and archaeological interest, appears to be of Norman character and design, although various conspicuous additions have been made at later periods, and, with its Norman details and carvings, is the most interesting part of Liskeard Church. I am also advised by Mr. PONTING (the assessor) that the three lower stages of the tower were erected during the last quarter of the twelfth century, and the top stage added at the end of the thirteenth or beginning of the fourteenth century; that beyond the rebuilding of the parapet and the work in 1627, when the west door was inserted and the exterior partly refaced with granite, little alteration has been made in the structure, which is an interesting relic of Norman Liskeard; that the settlements began at an early stage, probably during the progress of the Norman building; and that the tower can be underpinned and repaired without the addition of buttresses, and put in sounder condition than when first built. Structures in a similar, and, in some instances, more dangerous condition, owing mainly to defective foundations (namely, the towers of St. Peter's Church, Broad Hinton; St. Mary's Church, Bishop's Canning; Down Ampney Church; St. Mary's

Church, Tormarton; and All Saints Church, Martin), have been secured under Mr. PONTING'S supervision, and he is now engaged upon similar work at St. Mary's Church, Devizes. As a proof of his confidence in the feasibility of restoring the tower of Liskeard, he has expressed his willingness to gratuitously give to the petitioners written directions as to the methods to be adopted, and should they require it he would send a builder, who has done similar works under him, to carry out the work for them. The circumstance that no parishioner appears to oppose the faculty no doubt sufficiently justifies the anxiety of the petitioners to be allowed to replace the existing tower with a new one of larger proportions and of a totally different style and design. The Court, however, cannot disregard the fact that the builders of the present Perpendicular nave were content (probably from the value they set upon such ancient work) to leave the Norman tower standing, and is also bound to consider future as well as present parishioners. It is, moreover, the duty of the Court to discourage, so far as possible, the demolition of all such ancient and interesting ecclesiastical buildings as are within the limits of its jurisdiction, and in a diocese where Norman work is comparatively rare, no effort should be spared to preserve every link that connects the present age with the far distant past. I must, therefore, reject the prayer of the petition so far as it involves the demolition of the existing tower and the erection of the proposed new tower in its place; but (provided the tower is restored) a faculty may go for the erection of a vestry-room, in accordance with Mr. SANSOM'S plan, and for the opening of a doorway through the south wall of the restored tower. If, however, it will meet the wishes of the petitioners and parishioners, I should be prepared to sanction the necessary work recommended by Mr. PONTING for the preservation of the existing tower, and the erection of the proposed new tower (with such modifications as the altered circumstances render necessary) at the north-east or south-east corner of the church." How far the Chancellor's proposal will agree with the conditions of Miss PEDLER'S bequest will, of course, be a question for lawyers.

THE lectures at the Royal Academy will commence on Monday next at 4 P.M., with the course on chemistry, by Professor CHURCH. The subjects will be as follows:—Grounds for painting, classification and trials of pigments, selected palettes, vehicles and varnishes, methods of painting, conservation of pictures. On November 1 Professor ANDERSON begins his course on anatomy, which will be followed by the usual demonstrations. Sir W. B. RICHMOND will give the first of six lectures on January 10, 1898; his subjects are:—"In Memoriam" two great artists, Greek influence upon Italian art, GIOTTO in the Arena Chapel, Padua (two lectures), "Form," and "Colour." Renaissance architecture will be treated by Professor AITCHISON, the first lecture will be delivered on January 31, next year. The arrangements for the lectures on sculpture are not yet concluded. In the session there will be no evening lectures.

SOON after the visit of the Roman Catholic prelates to Canterbury Cathedral it was announced that the tomb of Cardinal POLE was to be restored as a memorial of the celebration of the landing of St. AUGUSTINE, as well as of the courtesy shown to the visitors by Dean FARRAR and Dr. MASON. The project startled archaeologists, for there was a risk that the tomb might lose its character. The Dean and Chapter propose to do no more than to restore the escutcheon supported by two angels bearing the arms of the late prelate. This was originally proposed by the late Canon JENKINS, as they are of great interest from an historical and heraldic point of view. There are sixteen quarterings, some of families now extinct, and, as the cathedral is such a storehouse of heraldry, the repainting of Cardinal POLE'S arms possesses distinct interest. The quarterings suggest the number of families to whom REGINALD POLE was related. His father, Lord MONTACUTE, was a cousin to HENRY VII., and his mother was daughter of the Duke of CLARENCE, brother to EDWARD IV. He was therefore a sort of cousin to Queen MARY, but there was no trace of the cruelty of the Tudors in his disposition.

A SEVENTEENTH-CENTURY AMATEUR.

IT is generally acknowledged that among the private gentlemen who lived in England during the troubled seventeenth century there was not one who was better entitled to be called a worthy than JOHN EVELYN, of Wotton, in Kent. He did not possess the military spirit which seemed to be needed by all men at the time. Nature had adapted him for occupations of a more quiet sort, and he was living in harmony with his disposition when he was studying works of art, writing books, etching, taking part in philosophical experiments or devising improvements in gardens. But he was out of place in the Civil War, and acted wisely when he left England in order to see the world. EVELYN tells us that he beheld on Tower Hill "the fatal stroke which severed the wisest head in England from the shoulders of the Earl of STRAFFORD," and as he was apprehensive that he could not steer his way through the calamities he anticipated, he departed for Holland soon afterwards. He was about twenty-one at the time. EVELYN spent much of his time in studying works of art and archaeological remains, but he utilised the numerous opportunities afforded him to obtain an initiation into politics and public administration. He had married the daughter of the king's ambassador in Paris, and was therefore in a favourable position to acquire the art of governing.

It is, however, of JOHN EVELYN, the amateur, we have to treat. The English university system was favourable to the creation of men of that class. The Grand Tour appeared to be a course of object lessons that supplemented the reading of the classics. The majority of fine gentlemen made the journey from city to city without calculating the extent of their mental improvement, or allowed the learned companions who accompanied them to monopolise all the intellectual advantages while their pupils amused themselves. But occasionally travellers were met who studied buildings, pictures and statues with as much care as if they were expected to stand an examination in those subjects on their return. They knew that men who were able to gain a reputation for a knowledge of ancient remains, or the works of Renaissance masters, were sure to obtain influence in England. We need only refer to one case as an illustration of the spirit of the time. ADDISON was among the shrewdest men who were to be found at the end of the seventeenth century. He was aware of his own worth, and was justified in anticipating a prosperous career. But his ambition soared above office in his university or in the Church. How was so poor a man to take the great world by storm? It may now seem incredible, but ADDISON considered there was no more certain route to success than by appearing as an amateur, that is, by demonstrating he was possessed of acquaintance with antique remains. If he had followed the bent of his genius, he would have described the life he saw around him in France and Italy, and enriched the world by a delightful book. Instead of anticipating the *Spectator*, he laboured as a topographer, and wrote tedious disquisitions on ancient medals.*

From time to time in the *Spectator* he returned to the subject, and it is evident from one of his papers he was well acquainted with JOHN EVELYN's translation of FREART'S "Parallel of the Ancient Architecture with the Modern."

It may now seem strange that amateurism should be so appreciated, especially in the case of buildings which represented a large outlay in money and where errors entailed discomfort. There were builders in England who were able to design as well as to construct in the seventeenth century, but few men claimed to be architects. The word was associated with extraordinary talent, with experience derived from a long course of travel, with an early study of the classics. In other words, architecture was identified with amateurism. This is suggested by the men who were selected by ALLAN CUNNINGHAM, the Scottish mason, as "the most eminent British architects." Between WILLIAM OF WYKEHAM and INIGO JONES there is a blank. INIGO'S versatility was so extraordinary, he was treated by BEN JONSON as an amateur. To some of his contemporaries he was "Mr. JONES, a great traveller." According to his own account he was a painter who had taken up architecture, for he says, "Being naturally inclined in my younger years

to study the arts of design (*i.e.* painting), I passed into foreign parts to converse with the great masters thereof in Italy, where I applied myself to search out the ruins of those ancient buildings which, in despite of time itself and violence of barbarians, are yet remaining. Having satisfied myself in these, and returning to my native country, I applied my mind more particularly to the study of architecture." WREN, who comes next, was a mathematician and student of physical science, and it is no exaggeration to say that if JOHN EVELYN were ambitious he might have succeeded Sir JOHN DENHAM, the poet, as Surveyor and Intendant of Buildings instead of WREN. Sir JOHN VANBRUGH, another of the most eminent architects, was a playwright. WILLIAM KENT painted petticoats and drew vignettes to prepare himself for the duties of a "restorer of architectural science." The Earl of BURLINGTON, in spite of all the praises lavished on him by his contemporaries, was no more than an amateur. Of the eight representative architects described by CUNNINGHAM, two alone—*viz.* GIBBS and CHAMBERS—would now be considered as practical members of the profession.

The value of such amateurs as we have mentioned is generally judged from a few buildings. But if we take the entries in JOHN EVELYN'S "Diary" as indications of what they were called upon to perform, it becomes evident that they were more often consulted than is commonly supposed, and hence they were influential. EVELYN had spent about ten years as a sort of travelling student, and he returned to England in the beginning of 1652. The first ceremony he witnessed was the funeral of IRETON, who was CROMWELL'S son-in-law.

EVELYN was not many weeks in England before he was called on to advise his brother about garden improvements at Wotton, which comprised, he tells us, the removal of a mountain overgrown with huge trees and thicket. In the course of his life he was engaged on many enterprises of the kind for the benefit of his friends and of himself. But during the Protectorate it was only in private that EVELYN could exercise his talents. It was known he was one of the trusted agents of the exiled CHARLES II., and his ability was not utilised for the public benefit. About the time of CROMWELL'S death he was twice summoned to form part of the commission on new buildings and on sewers, but, as he says, "because there was an oath to be taken of fidelity to the Government as now constituted without a king, I got to be excused and returned home."

CHARLES II. declared EVELYN to be an old friend, and if he were eager to share in the rewards which were then showered on courtiers whose services were less valuable, he could have gained power and dignity. Apparently he was only anxious for the welfare of the State. Thus on one occasion when he was on the king's yacht the conversation between the king and himself related solely to a scheme of EVELYN'S for abating the smoke nuisance in London, and his plans for the improvement of gardens and buildings. Soon afterwards we find him in consultation with Sir JOHN DENHAM about the proposed palace for the king at Greenwich. Sir JOHN wished to have it erected on piles at the brink of the river. EVELYN advocated a site between the river and queen's house, with a bay in front; but the discussion was fruitless. EVELYN "came away, knowing Sir JOHN to be a better poet than architect, though he had Mr. WEBB (INIGO JONES'S man) to assist him." CHARLES was glad to draw out EVELYN on other subjects besides building. We hear of conversations on bees, painting, engraving; but EVELYN did not enjoy the dissipation of Court. The gambling which the king introduced as a nightly entertainment also appeared to him to be discreditable to a palace which should be an example of virtue to the rest of the kingdom.

In 1662 EVELYN was appointed one of the commissioners for reforming the buildings, ways, streets and "incumbrances," and for regulating hackney coaches. He began his duties with consideration of how St. Martin's Lane might be made more passable into the Strand, and other improvements carried out in the neighbourhood. As a consequence, he relates how "we ordered the paving of the way from St. James's North, which was a quagmire, and also of the Haymarket about Piquillo." Soon afterwards we learn that EVELYN was called to consider the model of a new sort of ship at Lambeth, "the intention being to

* See *The Architect*, vol. xxxiii., pp. 312, 325.

reduce that art to as certain a method as any other part of architecture." Improvements in the Mint were as necessary as in ships, and the useful EVELYN became one of the commissioners.

EVELYN was not envious of other amateurs. In his first notice of Sir CHRISTOPHER WREN he speaks of him as "that incomparable genius." WREN showed him a model of the Sheldonian Theatre in Oxford, and did not disdain his advice in some particulars. Then we find EVELYN designing a chapel for the Earl of DENBIGH; another amateur, HUGH MAY, designed the stables. The latter was the architect for Lord BERKELEY's house, the site of which included a large part of Mayfair. EVELYN says "the porticoes are in imitation of a house described by PALLADIO, but it happens to be the worst in his book." MAY also designed the new house or plain fabric erected by the Earl of ESSEX at Cassiobury, and the villa at Chiswick for Lady Fox. "Swing-Swang" HOOKE was the architect of Montague House, which was the original of the British Museum, and PRAT designed Lord CLARENDON's famous mansion that was one of the short-lived wonders of London. Other cases could be added.

It is curious to find CHARLES II. was also desirous of demonstrating that he possessed some skill in architecture. On one occasion after he had thanked EVELYN for his books on architecture and gardening before several noblemen in the privy gallery at Whitehall, the king called him apart. "He then caused me to follow him alone to one of the windows," continues EVELYN, "and asked me if I had any paper about me unwritten and a crayon; I presented him with both, and then, laying it on the window stool, he with his own hands designed to me the plot for the future building of Whitehall, together with the rooms of state and other particulars. After this he talked with me of several matters, on which I find His Majesty had an extraordinary talent, becoming a magnificent prince." But CHARLES soon found other objects on which to expend the public money which were more interesting to him than any building.

Lack of money also prevented the realisation of a project of EVELYN's. He was appointed commissioner to take care of the sick and wounded as well as the prisoners of war, for England was then contesting against the Dutch. He went about this oppressive work with a conscientiousness and patience that seemed remarkable in a man who was more at ease in a picture gallery or cabinet of gems than in an hospital. His attention and kindness won him the applause of the king and of MONK, but EVELYN was more likely to prize the gratitude expressed by the sufferers, who were not accustomed to such treatment. The time was unfavourable for the recovery of the victims, as the plague was raging. EVELYN wished to erect a special infirmary. The king and Commissioners of the Navy approved of the plans, but, says EVELYN, "I saw no money, though a very moderate expense would have saved thousands to His Majesty, and be much more commodious for the cure and quartering our sick and wounded than the dispersing them into private houses, where many more surgeons and attendants were necessary and the people tempted to debauchery." When it is remembered that EVELYN was to look after the unfortunates who were food for powder, there seems to be irony in making him one of the commissioners for regulating the farming and making of saltpetre throughout the kingdom; but in the Court there was a notion that he was acquainted with all varieties of knowledge, and the more he was engaged the more leisure he could command.

His next office was more gratifying, and was a sort of compensation. He was selected as one of the three surveyors for Old St. Paul's, which was then in a dangerous condition. The description he gives of his first examination of the building on August 27, 1666, is interesting:—

I went to St. Paul's Church, where with Dr. Wren, Mr. Prat, Mr. May, Mr. Thomas Chichley, Mr. Slingsby, the Bishop of London, the Dean of St. Paul's and several expert workmen we went about to survey the general decays of that ancient and venerable church, and to set down in writing the particulars of what was fit to be done, with the charge thereof, giving our opinion from article to article. Finding the main building to recede outwards, it was the opinion of Mr. Chichley and Mr. Prat that it had been so built *ab origine* for an effect in perspective, in regard of the height; but I was, with Dr. Wren, quite of another judgment, and so we entered it. We plumbed

the uprights in several places. When we came to the steeple it was deliberated whether it were not well enough to repair it only on its old foundation, with reservation to the four pillars; this Mr. Chichley and Mr. Prat were also for, but we totally rejected it, and persisted that it required a new foundation, not only in regard of the necessity, but for that the shape of what stood was very mean. We had a mind to build it with a noble cupola, a form of church building not as yet known in England, but of wonderful grace. For this purpose we offered to bring in a plan and estimate, which, after much contest, was at last assented to, and that we should nominate a committee of able workmen to examine the present foundation. This concluded we drew all up in writing, and so went with my Lord Bishop to the Dean's.

With INIGO JONES's Corinthian porch, which was considered to enhance the interest of the old Gothic cathedral, it was no doubt considered that a Classic cupola would be a crowning grace; but that feature was to be reserved to a later time and for a different sort of cathedral. In less than a week after the examination of St. Paul's the fire began which left "that goodly church a sad ruin." The portico was rent in pieces, "nothing remaining entire but the inscription in the architrave, showing by whom it was built, which had not one letter of it defaced."

Within a couple of days EVELYN had prepared a survey of the ruins and a plan of a new city. He submitted it to the king. CHARLES and his wife "examined each particular and discoursed on them for nearly an hour." They appeared to be pleased with the project. But prompt as was EVELYN he was anticipated by WREN. Both plans coincided frequently, which excited the surprise of the king. One of EVELYN's proposals was to use the rubbish to fill up the shore of the Thames and in that way to have less variation in the depth of the waterway—in other words, to form a Thames Embankment.

We cannot expect to see human nature always philosophic, and although equable in mind on most occasions, EVELYN appears to have resented the preference shown for WREN's plan. Apparently he never visited St. Paul's Cathedral during the progress of the works. On the completion of the choir he went there and remarks that "some exceptions might perhaps be taken as to the placing of columns on pilasters at the east tribunal, but as to the rest it is a piece of architecture without reproach." With WREN he was afterwards associated in the arrangements for building Greenwich Hospital and Chelsea Hospital, but there was no sign of any warmth in their friendship. EVELYN, however, acted as godfather at the baptism of one of WREN's sons in 1679.

It would take a volume to describe the public and private services of JOHN EVELYN. He undoubtedly held more public offices than any of his contemporaries, and not one of them was a sinecure. Whatever was undertaken by him was faithfully carried out. But somehow he never received the rewards he merited. He was loaded with duties which were onerous, but CHARLES II. generally lost his memory and was indifferent to the claims of his loyal servitor whenever one of those desirable appointments which are liberally endowed became vacant. EVELYN was too modest to urge his rights, for he held reversions, or at least the royal promise of reversions. The only favour he obtained was the extension of a lease of Sayes Court, which was inherited by him. He seemed to be as much engrossed with private affairs as with those of the king. His judgment was supposed to be infallible, and it was often tested. Did a gentleman resolve to build a large house in London or in the provinces, EVELYN was invited to inspect the site and arrange about the planning. His advice was also sought about the selling of property, reparations or enlargements, and such family affairs as marriages, the education of children, trusteeships and so forth. If a man bought a picture he wished to have EVELYN's testimony about its merit, and VERRIO appears to have considered that EVELYN was the critic who should first be invited to give an opinion on every new wall-painting. It suggests EVELYN's shrewdness, when we find him observing that the danger awaiting mural work was to be found in the salts of the plaster and the moisture of the climate.

He rendered two important services which deserve to be remembered. He was the discoverer of GRINLING GIBBONS, who is described by him as "without controversy the greatest master both for invention and rareness of work

that the world ever had in any age." He found the carver in a small house at Deptford translating a copy of TINTORET'S *Crucifixion* into a relief. EVELYN introduced him to CHARLES II., to WREN and to other patrons, and the artist found commissions in abundance. Another service was the securing of the Arundel Marbles for the University of Oxford, and the Arundel Library for the Royal Society. The property was collected by the Earl of ARUNDEL, who was the friend of RUBENS, but his grandson left the marbles exposed to the air in the garden of Arundel House in the Strand, and he cared so little for books that anyone having access to the house could carry some off, and, says EVELYN, "abundance of rare things are irrecoverably gone."

JOHN EVELYN attained his eighty-fifth year in October, 1705. The death of his oldest acquaintance, Dr. BATHURST, the president of Trinity College, Oxford, in his eighty-sixth year, "stark blind, deaf and memory lost, after having been a person of admirable parts and learning," alarmed him, but he was spared a few months without any loss of intellect. His useful life came to an end on February 27, 1706.

RENAISSANCE ARCHITECTURE.*

THE lecture which I am to deliver this evening forms the opening of the courses for the study of architecture and construction in this college in the session 1897-98.

The details of this course are, I hope, fully and clearly stated in the printed programmes; but I desire to draw attention to the fact that both in construction and in architecture as a fine art the course is extended. Mr. Elsey Smith will give two series of preliminary lectures which in art will treat of the orders and Greek architecture, and in construction of the materials. This will give time for me to carry both my courses of lectures further than in previous years it has been possible to go, and the full course in each subject will be forty lectures instead of thirty.

The evening classes established by the Carpenters' Company for the practice of architectural and constructional drawing will be continued on three evenings in the week, and those for quantity surveying on one evening. The fees for these classes are very moderate, and the advantages are very good.

I wish to announce that I am unavoidably prevented from beginning my own Tuesday evening lectures before Tuesday week, the 19th; but Mr. Elsey Smith will begin his on Tuesday, October 12, and both his lectures and mine on construction will begin on Wednesday, the 13th.

I have now to turn to the subject announced for this evening's lecture, namely, "Renaissance Architecture"; and before beginning I desire to introduce to your notice the excellent volume on "The Architecture of the Renaissance in Italy," by Mr. W. J. Anderson, of Glasgow.

I do not see how I can better open the subject of Renaissance architecture than by asking you to accompany me in an imaginary visit to Westminster Abbey. We will go together to Henry VII.'s Chapel, the elaborate structure added on to the extreme east end of the Abbey. There we find enclosed by gilded railings the tomb of the founder.

As we look round you can hardly fail to be struck quite as much with the harmony as with the richness of the whole. Every part is perfectly in keeping. Even an untrained eye must perceive this to some extent, and the more artistic culture you have the more you are able to appreciate the universal prevalence here of one architectural character. But when you look through the railings surrounding the founder's monument, and examine as well as the closeness of their many bars and ornaments permits the tomb itself, you are conscious of a something not quite harmonious with the rest. All is rich and beautiful, but both its richness and its beauty are somehow different from the sort of richness and sort of beauty that pervade the entire building, down even to the ornamental grille which guards the tomb.

If you inquire you will very likely be told this tomb is Renaissance and that the chapel is Gothic, also that the tomb is Italian, all which is true.

You ask further, and you find that Henry VII. caused this chapel to be built as his mausoleum during his own lifetime, that it was practically completed at the time of his death in A.D. 1509, and that the Renaissance tomb was set up in it within ten years—that is to say, not later than the year 1518.

You go a little further before you leave the chapel, and you see in its side aisles the tombs of Queen Elizabeth, completed

in 1606, and of Mary Queen of Scots, erected about 1611, both by James I. These are most distinctly and definitely different from the architecture of the Abbey, and if you are a critical observer you may soon convince yourself that they in many respects differ in character as well as in shape from Henry VII.'s tomb. They, in fact, are English Renaissance, not Italian. We leave the Abbey, and I point out to you as we go the busy and florid exterior of the chapel in which we just now stood, and you note the rich and complicated sky-line, with its pinnacles and flying buttresses and high-pitched roof, and the windows full of mullions and transoms and cusplings, and the surface of the wall elaborately panelled in continuation of the decoration of the windows.

A few steps up Whitehall and we see the building erected in 1619 by Inigo Jones for Charles I., and known as the Banqueting Hall; and here we can hardly point to any one feature that is not glaringly in contrast with the corresponding part of the chapel we have just left. The character is stately and solid, but neither busy nor florid. The windows are bold square openings devoid of all stone filling-in like mullions. Instead of the busy roofs and pinnacles we have a straight unbroken sky-line, and for the fretted and panelled wall we have plain masonry with, in the lower part, the joints strongly marked, and above large round pillars carrying boldly a projecting cornice.

It is hardly possible to display the position of the Renaissance in England more exactly. It comes from Italy, where Henry VII.'s tomb came from. It was brought in by Henry VIII., who set up that tomb; and the first quarter of the sixteenth century is the date of its first appearance here.

By the time that Queen Elizabeth was dead Renaissance architecture (tinged very largely by English peculiarities) had taken hold on the country, and the tombs erected by James to the memory of Queens Mary and Elizabeth, to which I have already directed your attention, are good examples of what is termed Jacobean art, that is to say, early English Renaissance as practised in the reign of James I., and by the time that Charles I.'s reign had begun in 1625, matured Renaissance as practised in Italy had been introduced and adopted here, and the Whitehall Banqueting House is the work of the first distinguished English architect who built in that manner, Inigo Jones.

And now it seems necessary to anticipate two or three questions which must suggest themselves to you. What, you will ask, is actually meant by Renaissance? If it began in Italy, what was the manner of its beginning? If Henry VIII. introduced it, where did he get it from and how did he introduce it here?

What then, you ask first of all, is actually meant by Renaissance? The exact sense of the word is "new birth." The thing signified, when the term is used in its widest sense, is that awakening of the intellect and taste of Europe which took place in the fifteenth and sixteenth centuries, out of which sprang modern Europe, as contrasted with Mediæval. Employed in a more limited sense of the art of architecture, it signifies a great change, so great as to deserve to be termed a new birth, and which manifested itself in an abandonment of Gothic details and methods of design and the adoption of details and methods which had been employed by the Romans, with, however, such modifications as are called for by modern requirements. When we talk of Renaissance architecture we usually mean revived Roman modernised. Renaissance architecture as employed by some writers means less than others include. French writers usually restrict the term to the early period of the change; most other writers, including, I think, most English ones, make it with less accuracy include what followed the change, and so make the name cover the architecture of the seventeenth, and even eighteenth and nineteenth centuries.

In this lecture the most extensive meaning given to the word will be adopted, partly because there is no other English term generally accepted as applicable to what would be shut out if we limit Renaissance to its narrower signification.

Anything like an adequate answer to the second question, How did the Renaissance come about in Italy, the land where it began? would require far more time than we have at our disposal to-night, but a very slight outline it is possible to give.

The Renaissance did not begin in architecture. It began in a new temper of mind, which showed itself first in the fifteenth century and more strongly in the sixteenth, in literature, as well as in the arts and in sculpture and painting, before it reached architecture. The outcome of this new temper of mind was somewhat different according as it applied itself to letters or to politics or to art, but there was always one feature in all that the Italians did at this time, namely, a return to the Greeks and the Romans—the Romans whose language was the basis of the tongue they spoke, and whose blood ran in their veins; the Greeks, to whom the Romans stood indebted for all that was finest in their literature. It may be as well to add that Gothic architecture, though it had been practised in Italy, had always been a little foreign to the genius and sympathies of the people, and that as soon as something more congenial to those

* Opening lecture of the Architectural Classes, delivered by Professor T. Roger Smith at University College, London, on Thursday, October 7, 1897.

sympathies was presented to them it was eagerly adopted, and Gothic was at once and totally abandoned.

Florence is the city of Italy where Renaissance architecture began, and it made its appearance there early in the fifteenth century. The man who first practised it—in fact, the man who very largely created it—was Filippo Brunelleschi, a person of great genius, who was born in 1379 and died in 1446. In Italy at that time it was very usual for the same artist to be a sculptor, a painter, an architect and a worker in gold, and perhaps a poet and a musician also, or at any rate to unite the practice of two of these arts, and accordingly we first hear of Brunelleschi as a sculptor, but it was as an architect that he won his fame.

He went to Rome about the year 1403, and spent four years there studying the remains of Classic architecture and sculpture, and after his return to Florence he accomplished the feat of thinking out and carrying into execution a new manner of building. In the church built by him known as the Pazzi Chapel, and subsequently in the Church of the Holy Spirit, we have complete and consistent and excellent buildings without a shred of Gothic detail, adhering, it is true, to the received plan of a church, but clothing it in forms drawn direct from examples of old Roman work.

Without attempting to analyse here what I hope at a later period to go through with my class very carefully, I may say generally that in the early stage of Italian Renaissance everything is delicate rather than vigorous. The orders are sparingly introduced, and usually where they occur the shafts are flat pilasters, not columns. Panelling and sculpture, in low relief, furnish the most usual enrichment of the surfaces. The openings are usually small, and more often semicircular-headed than square-headed. In some few cases something like very simple tracery occupies the window heads. A characteristic ornament used as the filling in of a semicircular head over a square lintel now makes its appearance in the shell ornament, a beautiful and very appropriate imitation of a shell with radiating ribs like a pilgrim's shell.

There is a group of solid and dignified palaces at Florence, several of them due to the design of Brunelleschi, in which these characteristics are tinged with a severity of character inherited from older fortified houses.

Very good examples of early Italian Renaissance architecture exist in Venice. Among them I may perhaps select the Palazzo Vendramini as a specimen. This, like other Venetian palaces, is a compact square block with an unbroken straight front, rendered, however, extremely varied and interesting by the grouping of the openings. There are three storeys, and on each the main openings are at the centre. If the façade of a Gothic Venetian palace be compared, it will be seen that the same principle of grouping prevails. In the example under consideration the windows are round-headed, but there is a sort of simple round-arched tracery. Classic pilasters are introduced, but not obtrusively, and something of an entablature divides the top storey from the middle and main one, while a line of balconies divides that again from the solid-looking basement storey. An exaggerated entablature and a cornice fitted to the proportions of the whole building crown the façade and complete the composition. The style of these and other buildings in Florence, Venice, Rome, Milan, &c., is that which we know as early Italian Renaissance.

Later on there came mature Renaissance and later still the decline. Nor is it in Italy alone that these three phases present themselves. Everywhere Renaissance architecture may be said to have run a similar course, and to have had an early, a mature and a declining stage, although in many ways these differed in different countries, and the style assumed so many forms and was so tinged by the various influences which it underwent in different countries, and even in different cities, that anything like a classification is very difficult. As far as Italy is concerned it may be safe to say that the early style prevailed in the last seventy-five years of the fifteenth century, *i.e.* from 1425 to 1500. The mature style prevailed in the first seventy-five years of the sixteenth century, say from 1500 to 1575, and the decline then set in and lasted as long as the erection of important buildings continued. In every other country of Europe the dates would be later.

A few characteristics of Renaissance when fully developed—mature Renaissance—show it in strong contrast with Gothic.

First, the window has ceased to be a prominent and a rich feature, and on the other hand the wall has become so.

Secondly, the sky-line, which in most Gothic buildings is of great importance, is in the majority of Italian Renaissance buildings very uninteresting, though not in all.

Thirdly, the Classic orders reappear as decorative features almost without exception.

Fourthly, all the forms, mouldings and ornaments are imitated from or suggested by ancient Roman buildings, and supersede those in use in Gothic buildings. Thus the semicircular arch replaces the pointed arch, and the lintel once more is straight instead of being cambered or of arched construction.

Fifth, the Roman forms of vault supersede the Mediæval, and the dome especially is frequently employed and made a main feature.

A building of the matured Italian Renaissance may not show all the above characteristics, but it will show most of them. Perhaps as good an example as can be selected is the library at Venice, the work of Sansovino, architect and sculptor, erected about 1540, and it is the more useful to select this because its architecture has been copied (with some variations) by Smirke, in the Carlton Club, Pall Mall, where it can be seen by all of you.

The building is of two storeys—a Doric order below and an Ionic above, the orders in each storey being combined with semicircular arches open below, closed by windows above. The entablature of the upper order is very much higher than the usual Classic proportions would prescribe, in order to give a cornice sufficiently large to crown the whole building. Above the cornice is a high balustrade giving a level sky-line, broken only by a statue over each column.

The keystones of the arches are carved, the spandrels above them are occupied by sculpture, and the frieze of the upper entablature is enriched with heavy swags of carving and boys, and has small oblong openings. Regularity, dignity, richness, repose, and above all the most satisfactory proportions throughout, are among the qualities of this noble building.

I have already mentioned Smirke's copy at the Carlton Club, Pall Mall. He has omitted the statues—a definite and very regrettable loss—and he has carried out the shafts of his main order in granite, instead of the same stone as the rest of the front. This is a more unfortunate alteration than the other, for it makes the shafts unduly prominent and diminishes the sense of breadth which one gets from the original; still, as a full-size copy of a portion of one of the best buildings of the best period of Italian Renaissance, this club-house is worth looking at carefully.

In a Renaissance church the straight sky-line disappears, for there is usually a dome and often a pediment at the end of each limb.

In church-building the Renaissance architects revived the ancient Roman methods of vaulting, and indeed they used such vaults as the Romans had previously employed wherever in secular or domestic buildings a vault was required.

The greatest feat of the Revival was, however, the return to the dome, which had not been modified, as the vault was, by the Gothic architects, but had been avoided entirely. The great dome of the cathedral of Florence was the work of Brunelleschi, the father of the Italian Renaissance; and afterwards in a series of churches this feature was employed and was modernised till in St. Peter's, at Rome, it became the central and dominant feature of the foremost building of the time.

St. Peter's is the greatest building of the Renaissance. It had the fate to drag on through a century or more, and each architect who was employed on it recast the design. The first was Bramante, and his plan was for a building nearly square in outline and with a large central dome. The dome was begun, and in the plan of every succeeding architect was the main feature. At length the last recast of the design was made by Michel Angelo, who fortunately was able to carry his work so far that no great interference with his scheme itself seemed to be possible. But, though his building could not be much altered, it was possible to add to it, and accordingly after his time the nave was elongated and a vestibule was built. These additions really detract from the effect of the exterior of the cathedral instead of adding to it.

The dome of this vast cathedral is a most dignified and vigorous structure, and is, as it ought to be, the finest work of the mature Renaissance, and the finest dome, inside and out, in Europe. Perhaps the dome of St. Paul's rivals it in external effect; but even the most prejudiced Englishman, if he has seen both, will hesitate to claim that the interior of the dome of St. Paul's equals, or even approaches, its Italian rival in beauty. In point of structure also St. Peter's is the nobler. It is outside as well as in of masonry, whereas the exterior dome of St. Paul's is only a domical roof, and is liable to be destroyed by a chance spark or an untoward flash of lightning.

I have already described a typical secular building of the mature Renaissance—the Library at Venice—and have referred to the greatest church building—St. Peter's. In these and in many other instances it will be found that the openings have grown large; often they are arches rather than windows. The orders have become conspicuous, and the pilaster has nearly always given way to the column. The decorative sculpture has become rich and in high relief, the rustication is very strongly marked, and the windows very frequently have each of them pilasters at the jambs and a little pediment. In short, there is a great air of vigour and richness; there is also a singularly fine sense of proportion, which lends to the best productions of the Italian Renaissance a great and a very subtle charm.

The buildings of the decline exaggerate the vigour of the mature style. Their features are bold enough to be program, their carving and sculpture extravagant and heavy. Refine-

ment is in some cases quite lost; in others greatly spoilt and overdone ornament takes its place. There are, however, a hundred ways of going wrong, and in the seventeenth century Italian architects went wrong in various directions. One of the best of the later Italian Renaissance buildings is Sta Maria della Salute at Venice.

At the outset of this lecture I suggested three questions, and I have now tried to answer the first two, namely (1) What is Renaissance architecture? (2) How did it arise in Italy? There remains the third question, How did it come to England? Where did Henry VIII. get it from, and how did he introduce it here? The short answer is that Henry VIII. got it from France and the Low Countries rather than direct from Italy, but that he induced artists from every European country where they were to be found to visit England and settle here and work. Probably the best known name among those of artists imported in this way is that of Hans Holbein, the painter, but though he is believed, after the custom of the time, to have been skilled in various arts and to have done some architecture, it is chiefly as a painter that we know him. There were, however, others.

The Renaissance architecture that Henry's artists brought with them early in the sixteenth century was of course of the early phase, whether they came from Italy or France or Flanders. This had more affinity with Gothic than the matured style displays, and, however introduced, it had in England and in France to contend against or else combine with Gothic architecture, strongly rooted in the building instincts of the people, as it had never been in Italy.

It will not be possible to include within reasonable limits of time any description of Renaissance in Germany or in Spain, but it seems almost necessary to say something about its early phase (the Transition) in France. That phase began by the adoption, early in the fifteenth century, of Italian painting, sculpture and gardening, but it was not till the close of that century that architecture in France came under Italian influence, and then, and far on into the sixteenth century, it is rather a new phase of Gothic than a modified form of Renaissance which we find in French buildings. Léon Palustre, in "*L'Architecture de la Renaissance*," points out that what occurred was the deliberate and consistent adaptation of the forms of Classical art to a disposition of buildings which had been adopted during the Mediæval period. Early in the sixteenth century we meet with French Early Renaissance work which has, it is true, discarded the pointed arch, but in almost every other respect remains Gothic in essence and quality, though not so in ornament. The style of Francis I. is the culminating point of this period, and that monarch and Henry VIII. met on the famous Field of the Cloth of Gold—a sufficient proof that there were ample opportunities for French fashions in art to pass over the Channel.

Perhaps the sixteenth-century wing of the château of Blois and the contemporary châteaux of Chambord and Chenonceaux will sufficiently show something of the quality of the architecture of Francis I.'s time, and it would be well worth while to compare these buildings with the great Gothic château of Pierrefonds in order to see how Gothic the early Renaissance was in France.

In none of the many phases which this art passed through in the different stages of its growth and at various centres of civilisation was Renaissance ever quite so charming, so graceful, so full of provoking little turns and unexpected oddities, yet so uniformly in perfect taste, as in France during the earlier years of the sixteenth century. The sky-line of the châteaux built at this time is as full of play, as much diversified by high-pitched roofs of large mass, by dormer windows, and by pointed terminals to turrets and towers, as in the best domestic Gothic. The plans were similarly broken and varied, the bay windows on corbels were as picturesque, the general feeling was as free as in the previous style, only there was a quite different and exquisitely restrained yet profuse ornament, there were some echoes in the shape of pilasters and cornices of the Classic order, and there was, perhaps, a shade more regularity and symmetry in the disposition of the masses.

This charming style has not been made use of by modern architects to the extent to which it might have been expected, and has seldom been well managed when it has been attempted. The best English example is the Holloway College, by Mr. Crossland. The elegant building lately completed by Mr. Aston Webb, in a style approaching early French, on the Embankment, and next to the School Board House, shows that in his hands, at least, this graceful phase of art could be reproduced to perfection.

In England the fusion of Gothic and Classic was difficult, and took long. The Transitional style which was eventually evolved did not make its appearance so early here as in France. It was to a great extent suggested by the French, but was not so elegant or so rich, yet has its own excellences. We generally know it as Elizabethan, and in its later phases as Jacobean, and we are, I think, as a nation, very proud of the best examples of Elizabethan. Most of these are noble mansions,

and their existence remains as a kind of monument of Henry's violent methods of Church reform, and of the tranquillity and security which this country enjoyed under the sagacious and prosperous rule of Elizabeth. At the dissolution of the monasteries Henry VIII. seized vast estates which had belonged to the monks, and most of these, with the disused buildings, were granted to favourite noblemen and gentlemen. It was, however, not till the succeeding reign that enough wealth was amassed and enough tranquillity secured to justify the nobles and squires in erecting costly houses; but under Elizabeth, in every part of England they began to rise, almost all of them showing a mixed architectural character. Many of them continue to this day to serve as delightful residences, at once dignified and cheerful.

There are also Elizabethan buildings of a more public character, no churches that I am aware of, but halls, libraries and almshouses. As a general rule each Elizabethan building has some Gothic features and some Classic ones, but both the one and the other have been more or less modified in the process of fusion. Most often the general form and disposition is Gothic, the clothing more or less derived from Italian; but the architects seem to have felt that in order to blend the two the Italian ornament should be itself modified, and to do this they have very much debased the detail. Elizabethan and Jacobean work is more often clumsy than refined, more often coarse than elegant. The workmanship is often not a little rough, and the ornaments are usually more or less rude, if rich and bold; but still the best examples of Elizabethan buildings reach a high degree of excellence, mainly on account of their fine masses and their frank adaptation to the purposes which they were built to serve. There are not many specimens remaining in London. By far the finest is the Middle Temple Hall, which has a sober exterior, but one of the most noble of interiors. The roof is a hammer-beam roof—I believe the last great roof executed on this principle—and its general lines are of Gothic origin; but all its ornaments and details come from Italian architecture, and in the fine oak screen, richly carved, and the panelling round the walls very few traces of their Mediæval origin are left.

At the South Kensington Museum you can examine a good specimen of Jacobean street architecture—the front of Sir Paul Pindar's house, standing till within a year in Bishopsgate Without; its mullioned windows and general air possess a definite character not of the highest class, but very distinctive.

At length there rose an English architect who had been educated in Italy—Inigo Jones. It is said that he desired to become a painter; but, like many of the Italian masters among whom he studied art, he prepared himself for the practice of architecture as well as painting, and it was his architectural work which made his reputation. Curiously enough, no inconsiderable part of that reputation rests upon an unexecuted design, the one which he made for King Charles I.'s palace at Whitehall, of which one little corner only was built—the Banqueting House. I referred to this building as a typical one in the opening remarks of this lecture, and no better or more complete example of the mature Renaissance as practised by Inigo Jones and his followers exists.

I will pass at once to the greatest genius and most successful architect belonging to the Renaissance in England—Christopher Wren. He had the rare fortune to enjoy an almost unparalleled opportunity, created by the Fire of London, and to prove equal to the call upon his energy and his genius.

Wren's most famous building you all know—the cathedral of St. Paul. He had desired—as Bramante desired when he made the first plan for St. Peter's, and as Michel Angelo, when he made what he thought was the last—to build a church approximately square, with a central dome; but he had to change his plan, and his church has, like St. Peter's, a long nave, and also has a long choir. Fortunately the change was made at St. Paul's before building was begun, and so the design could be, and was, radically modified and made to fit the programme, which required a long nave, instead of the feature being added after the church was built, as was the case at St. Peter's.

As a result, St. Paul's, if different from what Wren had first wished, is still consistent throughout, which is more than can be said for St. Peter's; though, on the other hand, the exquisite beauty as well as vastness of the interior of the Roman cathedral are not approached by the much smaller London one.

You may, however, visit St. Paul's with the certainty that you there see, with one exception only, the best thing that Renaissance architecture has done, and probably the best that it can do to rival the splendid cathedrals of the Middle Ages. How far this rivalry has been successful is a question which persons of cultivated taste have answered very differently at different times, and for a very good reason—their cultivation has not always been of the same sort; and I believe it will always remain a question the answer to which will be very much influenced by early associations, by training, even by prejudice, and possibly by natural temper of mind. I am not myself disposed to venture any answer of my own.

Wren designed and carried out a considerable amount of secular work; next to St. Paul's his greatest successes were not such buildings as Chelsea Hospital and the completion of Greenwich Hospital, but the London parish churches, of which he designed and built a large number. Most of these are small; they are unequal in their degree of excellence, but the best are extremely good. The most famous of his towers with spires is Bow Church. The tower is visible from the base upwards. Down below the architect provides a dignified entrance, and then he rightly carries up the tower perfectly plain till it is clear of adjoining roofs and buildings, when comes the belfry stage with the suitable large openings. Above this rises the spire, a rich composition built up in the most skilful way, and one of the greatest ornaments of London. Simpler but hardly less beautiful is the arcaded spire of St. Bride's Church, and there are many more. In this idea of a Classic spire Wren was an original inventor, and few attempts have been made to follow his example.

The most common defect of Renaissance buildings is tame-ness—an uninteresting correctness, a respectable solid monotony. This defect at least can never be complained of in Wren's work. It is full of variety—contrasts of light and shadow, of opening and solid. It is also pervaded by a fine and subtle feeling for proportion. If you examine any of Wren's designs, compasses in-hand, especially if they are his own original drawings, you become impressed with the faith that he had in the value of simple geometrical relations between the different parts. Nowhere can this be better seen than in the plan and sections of St. Paul's, or in those of St. Stephen's, Walbrook.

When one has to try to present some view of a very extensive subject in a very short time, almost the only chance of success is to limit one's self to a few salient points, and having reached the most conspicuous figure in the history of English Renaissance, the path of wisdom will be to leave off at Wren's architecture.

Let me then in closing remind you that some phase of Renaissance—unfortunately only too often the copy of a copy—is the architecture of the day to a great extent in every country on the Continent of Europe, and to a very large and apparently an increasing extent in our own country. To all appearance the reasonable probability is that those who are beginning to study architecture now with a view to practise it as a profession, will find that if they are to follow the current of public opinion in their day it will be some form of Renaissance art that they will pursue. If this is so, and it is what I firmly believe, then it is quite right for our attention to be directed to Renaissance from the first, and let me add that it is of importance also to go to the fountain-head and study the Classic originals themselves, to which Renaissance architecture is so deeply indebted.

THE BRUSSELS EXHIBITION.

THE superior jury have confirmed the awards made to the following British artists:—Médaille d'honneur—L. Alma-Tadema, R.A. First-class medals (painting)—Frank Dicksee, R.A., E. J. Gregory, A.R.A., Seymour Lucas, A.R.A., H. Herkomer, R.A., Sir J. D. Linton, P.R.I., J. W. Waterhouse, R.A., J. C. Hook, R.A., J. S. Sargent, R.A., E. Onslow Ford, R.A. (sculpture). Second-class medals (painting)—W. Q. Orchardson, R.A., S. J. Solomon, A.R.A., J. Aumonier, R.I., G. Clausen, A.R.A., Charles Green, R.I., D. Murray, A.R.A., Mrs. Allingham, R.W.S., R. Macaulay Stevenson, J. Lavery, J. W. North, A.R.A., W. W. Ouless, R.A., J. L. Pearson, R.A. (architecture), G. Frampton, A.R.A. (sculpture), A. Drury (sculpture), D. Y. Cameron (engraving). The exhibition authorities have purchased the picture "Apple-blossom and Tulips" (No. 118) by Alfred Parsons, A.R.A., for the grand lottery.

THE BARGE OF TIBERIUS.

THE recent recovery of some remains of the famous triremes of the Emperor Tiberius, which lie at the bottom of Lake Nemi, is of great interest both to artists and antiquaries. The lake of Nemi, which is situate about seventeen miles south-east of Rome, is formed by the crater of an extinct volcano. Upon its broad bosom once floated the magnificent pleasure-house of the luxurious and licentious emperor, Tiberius Claudius Nero, who, leaving his duties at Rome in the year A.D. 26, retired the year following to the island of Capræ, where he indulged in the greatest sensuality. His love of luxury and display was exhibited in the two famous pleasure triremes which bear his name, and the remains of which now lie buried in the lake of Nemi. The discovery referred to consists of the finding of several massive metal mooring-rings and tops of stakes by which the vessel could be moored to the quay. The rings are fixed in the mouths of bronze heads of lions, wolves and Medusæ, by the teeth of which they are retained in their proper places.

These bronze heads are marvellously modelled, and the faces are characterised by a life-like similarity to the animals represented. Despite their long immersion in the mud of Lake Nemi, they are all perfectly preserved, and the massiveness of their build and the beauty of their outline enable the spectator to judge of the magnificence of the structure of which they once formed but a secondary and almost insignificant part. It is said that the trireme to which these ornamental mooring-rings belonged was that dedicated to the worship of the goddess Diana, but about this and other points connected with these submerged vessels there has been recently a good deal of discussion. What is certain, however, is the fact that last week the Court at Rome ordered the castle and lake of Nemi to be offered by public auction for debt. The present owner of the Nemi estate is Don Filippo Orsini, Prince Assistant at the Pontifical Throne, which is the highest lay position at the Papal Court. The sale of the Nemi estate will doubtless include the remains of the famous Tiberian vessels which now lie at the bottom of the lake.

LIVERPOOL ARCHITECTURAL SOCIETY.

THE first ordinary meeting of the fifteenth session of this Society was held on Monday evening, at the Law Library, Union Court. The opening address by the president (Mr. W. E. Willink) and the nomination of members formed the main portion of the business. A letter from Mr. Cowell, librarian of the Free Library, William Brown Street, was read, in which the writer mentioned that an interesting collection of drawings of bits of Old Liverpool, by Herdman and others, were to be found in the library, and requesting that any member of the Architectural Society who possessed or acquired duplicates or photographs or drawings of any kind bearing upon the same subject should kindly allow them to be added to the collection, either by presenting them or by enabling the library committee to purchase them. The President's address was a learned disquisition on the art of architecture, in which he traced in some measure the effect of literature upon that art. Independence of mind, individuality of design, and a disregard of *ensemble* had produced in groups of buildings very inartistic and inharmonious effects. He would advocate censorship of design. The present was a time of efflux, he said, and he warned students of the dangers that beset them. Study was most important, and he advised young members of the profession to examine and criticise their own work just as if it had been that of another. Students of architecture had in Liverpool opportunities for learning their profession which no community outside London possessed. In this school students had the means of gaining knowledge and of practising and perfecting themselves in the various departments of their craft which were unsurpassed elsewhere. In conclusion, he appealed for co-operation in the work of the Society, and urged its members to emulate the true public spirit of their predecessors of fifty years ago.

KING'S COLLEGE.

THE distribution of prizes to the students of the architecture and building construction and woodcarving classes was held at King's College. The Rev. Dr. Robertson, principal of the College, occupied the chair, and was supported by, amongst others, Sir Henry Harben, and the master, clerk and warden of the Carpenters' Company. Professor Banister Fletcher reported that the competition for the two free scholarships given by the Carpenters' Company took place at the College on September 27. There were twelve candidates, of whom ten sat for the examination, the successful candidates being Mr. A. C. Remnant (126 marks) and Mr. C. J. T. Dadd (123 marks). In conclusion he announced that since the opening of last session the whole of the original diagrams and drawings prepared by the late Sir Gilbert Scott, R.A., and his pupils, numbering some 400 drawings, had been presented by his son, Mr. John Oldrid Scott, F.S.A., to the architectural school of the College. Sir Henry Harben presented the prizes to the successful students, and afterwards delivered a short address to the students present. The Rev. Dr. Robertson proposed a vote of thanks to Sir Henry Harben, saying that a great deal of the success which the classes had achieved was due to the munificent and thoughtful support received from the Carpenters' Company. Mr. Joseph Henry Gibbins, master of the Carpenters' Company, seconded the vote, which was carried unanimously. A vote of thanks to the chairman concluded the proceedings. A conversazione was held afterwards, various exhibits in connection with the architectural classes being thrown open to the guests.

Black Granite in large blocks, rough as well as polished, is largely exported from the port of Åhus, in Sweden, to Germany.

NOTES AND COMMENTS.

THE authorities of the great museums are disposed to look askance on casts. We have some in the British Museum, but their introduction is to be attributed to special considerations. The casts from the *Ægina* statues in Munich are reminders of what can be lost by a want of interest on the part of the Government, and the same can be said of other examples. The treatment which the collection of casts received in the South Kensington Museum reveals the animus which exists. Casts are always inferior if compared with original works, and their presence sometimes has the effect of making ignorant people imagine that examples which have cost large sums are only a sort of reproduction. In the Louvre all considerations of that kind have to be set aside in order to please the multitude. A museum of casts of antique sculpture is about to be opened. The arrangements are in the hands of M. RAVAISSON-MOLLIEN. The Louvre contains many chambers which are not used, and for the casts the riding-school of the late Prince IMPERIAL has been assigned. It lies between the Pavillon Denon and the Porte Jean Goujon. The roof is supported by columns which were designed by M. FRÉMIET the sculptor. There are already many reproductions in bronze of antique sculpture, but students of the history of the art will be glad to have the fine collection of works in marble supplemented by casts which can enable them to clear doubts more readily than is possible with illustrated books.

ARCHITECTURAL competitions do not appear to be fully acclimatised in the United States. The collapse of one for the erection of a new capitol for the State of Pennsylvania at Harrisburg suggests the difficulty of securing fair play. The sum assigned for the building was 110,000/, and appears ridiculously small if compared with the requirements and with the cost of various other capitols. Six architects only were invited to send in plans, and a sum of 200/ was promised to each of them, but other architects could also take part in the contest, and it was announced that the designs would be impartially considered. The programme was carefully drawn up by Professor LAIRD, of the University of Pennsylvania; he and two New York architects formed the jury. It is not easy to keep affairs secret in America, and the selection of the designs leaked out. Some of the competitors felt aggrieved, and the local press took up their cause. The commissioners being afraid of the *vox populi*, decided to reject all the plans and to call for a new competition. Professor LAIRD has protested. He upbraided the commissioners, saying to them:—"You have, in my opinion, violated the terms of your contract with the competitors, and have entered upon a course of action in which I cannot accompany you without loss of self-respect and professional honour. I stand ready to perform my full duty as your adviser, and I ask respectfully that I be given opportunity to complete my service under the terms of the programme. Should you be unwilling, however, to grant this request, I am left no alternative but that of presenting my resignation as your adviser. I respectfully ask that immediate action be taken on my request, and that if it cannot be granted my resignation in that case, hereby offered, be accepted, to take effect immediately." There seems to be little use in protesting. The competition has failed, and a body of men holding the highest positions in the State, who had guaranteed the honesty of the conditions, has caused several unfortunate architects to waste their time and ability in a fiasco.

THE Hugh Reid Bequest, which is in charge of the Edinburgh Town Council, amounts to about 3,000/. The money is available for the purchase of sculpture for the adornment of the city. It is proposed to expend a part of it on statues of King ROBERT BRUCE and Sir WILLIAM WALLACE, which are to be set up on two of the pedestals of the new North Bridge. It is suggested that the third pedestal should be used for a statue of JOHN KNOX which is at present placed in the quadrangle of the new college, while the fourth would be reserved for one of ROBERT

BURNS. In that way three of the makers of Scottish history would have their memorials, as well as the most popular of all the Scottish poets.

M. JOLIET, who is one of the most useful members of the Comédie Française, was originally an engraver. In 1870 he obtained a medal from the Salon, in 1873 another was awarded to him at the Vienna Exhibition, and in 1875 his ability was recognised by his election as member of the jury of the Salon. He was a long time engaged on the *Monde Illustré* and *L'Illustration*, and his work was appreciated by publishers. A great many of the designs of GUSTAVE DORÉ were reproduced by M. JOLIET. Although he no longer practises engraving M. JOLIET has not renounced the pictorial arts, for he now practises in pastel. There are other members of the Comédie who are skilful in drawing and colouring, and we believe that every theatre in Paris contains more than one actor who can claim to be amateurs in painting.

IN the imperial Russian theatres a new prompter's-box has been introduced which offers a problem in acoustics, which has a wider application. In many cases the occupants of the boxes nearest to the stage can hear the prompting almost as well as the actors. The new Russian invention consists of a box that resembles a shell, and which is enclosed within a short cylinder. The timber employed is perfectly dry; it is then thickly varnished and covered with alternate layers of felt and compressed paper. The prompter is at a depth which makes him invisible to the audience, and not one of his words can be heard in the auditorium. But from the form and method of construction of the box a whisper can be heard distinctly on the stage.

THE "Antiquary's Library" (ELLIOT STOCK) is to be a cheap series of volumes which relate to the past rather than the present. Some of them have appeared at a higher price. The second volume is Mr. PHILIP NORMAN'S "London Signs and Inscriptions." It contains a record of the survivors of the sculptured house and street signs, and many quaint stories about them are told by the author. The following signs are treated, viz.:—Human signs, such as the popular boy in Panyer Alley, which is the first object sought out by some visitors to the City; astronomical signs; animals and birds, real and imaginary; crests and coats of arms, &c. Modern building regulations are unfavourable to projecting signs, and in consequence London streets are deprived of features that would add to their picturesqueness. Much of the effect which is so much admired in Belgian towns is owing to signs and other images. Mr. NORMAN'S book is interesting from beginning to end.

ILLUSTRATIONS.

CATHEDRAL SERIES.—CANTERBURY: CRYPT CHAPEL OF OUR LADY OF THE UNDERCROFT.—CHAPTER-HOUSE.

HER MAJESTY'S THEATRE, HAYMARKET.—ROYAL RETIRING-ROOM.

COTTESMORE SCHOOL, HOVE.

THIS building, recently erected in its grounds of eight acres, overlooking Hove, is designed for the accommodation of a private preparatory school. Broseley tiles, red-facing bricks and dressings of Monk's Park stone have been used. The building is electrically lighted throughout, and the hot-air system has been successfully adopted for the warming of the larger rooms and corridors.

The builders were Messrs. GOUGH & Co., of Hendon, and the architects Messrs. BROWN & BARROW, F.S.I., A.R.I.B.A., of 12 Norfolk Street, W.C.

ECCLESIOLOGIA GERMANICA.

By T. FRANCIS BUMPUS.

IN pursuance of a promise made in a former issue, I proceed to lay before my readers some notes illustrative of the impressions conveyed to me by German architecture, during a short tour lately made among the old cities and towns of Westphalian Prussia and Thuringian Saxony, notably Osnabrück, Minden, Herford, Hildesheim, Halberstadt, Naumburg and Erfurt.

While perfectly aware that the ecclesiastical architecture of this part of Europe is vastly inferior to that of France, where nobility of conception, skill in the disposition of ground plans and beauty and vigour of sculpture are leading characteristics, it would be idle to deny that there is something exceedingly fascinating, and at the same time perplexing, in the study of German ecclesiology. Take, for instance, that imposing line of Rhenish-Romanesque churches, Neuss, Cologne, Bonn, Limburg and Gelnhausen, all of which were in building during the middle of the thirteenth century—one indeed, Gelnhausen, belonging even to the fourteenth. Now, were we to see these churches in England or France we should assign them to the last three decades of the twelfth century, whereas they are, generally speaking, fifty years later, so tenaciously did the people of the Rhenish provinces cling to that style which they had brought to such a pitch of perfection in the examples just enumerated.

Thus it is that, those beautiful gradations from Romanesque to Late Pointed, that natural growth which forms so delightful a feature in our own country's architecture being absent from that of Germany, makes its study, as I hinted just now, one requiring great absorption, and one that is not devoid of fascination and perplexity.

Leaving Osnabrück, where some interesting specimens of *ouvrage du fer forgé* and *orfèverie*, in the shape of a fifteen-branched herse-light for the office of Tenebræ, and sundry altar and processional crosses, preserved in the sacristies of the solemn Transitional cathedral and Pointed church of St. John elicited my admiration, I journeyed through a pretty pastoral bit of Westphalia, where white-washed and red-tiled homesteads embosomed in trees were lit up by a glorious sun, to Minden. The Catholic Domkirche

of this picturesque city is not a vast edifice, and this makes the presence of three enormous windows on either side of its "hall" nave not a little to be wondered at. More curious than beautiful, these windows, in whose tracery the fancy of the designer seems fairly to have run riot, failed to give me so much pleasure as the piers supporting the arches of the arcade, composed as they are of a cylinder round which four thick and four slender shafts cluster, all with delicately chiselled capitals. Perhaps to a severe criticism these piers at Minden may seem deficient in that elegance characteristic of similar work in the retro-choir at Ely; but they must, together with the arches, I think, rank very high among contemporary German work of the kind.

A short railway ride in a fourth-class compartment—far more agreeable than books or common report had led me to expect—brought me late in the golden afternoon sunlight to Herford, whose thirteenth-century minster—an interesting

example of the tenacity with which the Germans clung to their round-arched style—and the shrine-like St. Maria-auf-dem-Berge, a perfect gem of fourteenth-century Gothic, kept notebook and pencil in constant employment. Between Herford and Hildesheim is Hameln, where, however, a wait of twenty minutes was insufficient to go into the town and see the minster church of St. Boniface, which, together with the chain bridge spanning the Weser, assisted in composing a very agreeable picture—one that would have been doubly agreeable had the weather been fine—as the train steamed into the station.

By midday, shortly after which the glass "went up" a bit, Hildesheim was reached, and I set out on foot in quest of the inn—Der Goldener Engel—which was, after some difficulty and détour, found. As however the latter introduced me to sundry thoroughfares which might otherwise have remained unexplored, I did not regret it.

The admirer of Mediæval Domestic architecture will have his tastes gratified, not to say gluttied, by a visit to Hildesheim, the streets in the old quarter of the city being composed of low-browed steep-gabled houses, exhibiting in many instances

quaint paintings, and in almost every one a profusion of rich carved ornament. Such a house was Der Goldener Engel, where I had elected to take up my quarters in this old episcopal city, portraits of his Holiness Leo XIII. and the present occupant of the see of Hildesheim embellishing the walls of my chamber with great appropriateness. The afternoon Offices were being monotoned, as I entered, in the high choir behind the celebrated Renaissance rood-screen, so that for a time I was obliged to confine my observations to the western portions of the building.

Originally, the cathedral of Hildesheim was an eleventh-century basilica with short transepts and choir. The stalls for the officiants here, as in nearly all the churches of the same period in this part of Europe, are carried across the transept, being enclosed beneath the western arch of the crossing by the fine rood just now alluded to, and beneath which are the steps to the crypt, which, German fashion, is by no means so subterranean as those of France and England.

Unfortunately, the original character of what must have been a simple solemn church, like Gernrode and Hechlingen, was entirely obliterated during the middle of the last century, when the interior was encrusted with that meretricious

trumpet characteristic of the Louis XV. period. The same epoch had added side chapels to the nave—an almost unique example of these appendages in a German church. That the ensemble of the interior of Hildesheim Cathedral is woefully disappointing goes without saying, and we can only hope that judicious restoration will tear off this hideous Pompadour mask, and allow the building to stand forth in all the simple, solemn Romanesque grandeur that forms so noble a feature of the city's two other basilicas, St. Michael's and St. Godehard's. There are, however, numerous items of interest in the Dom at Hildesheim. Besides the voluptuous rood-screen above mentioned there are the great bronze western doors; a brass font, elaborately chased; a huge corona lucis pendent from the nave ceiling, and representing the Heavenly Jerusalem—a corona of which a copy can be seen at South Kensington; a pillar in the transept modelled on that of Trajan at Rome, having twenty-eight scriptural groups com-

A STREET CORNER IN HILDESHEIM.

mencing at the base and ascending spirally to the summit; and numerous costly service-books, altar and processional crucifixes, chalices, pyxes, thuribles, &c., for use in the service of the sanctuary. The majority of these instrumenta (not however confined to the cathedral, but found scattered about in the museum and other church sacristies of the city), owe their existence mainly to the great bishop, Bernward, who presided over the see from 993 to 1022, and who, amid the active discharge of his spiritual functions, found time to superintend the various ateliers of artisans he kept employed for the purpose of enriching his churches with such works of art as I have alluded to above.

It is to St. Michael's or St. Godehard's that you must go to see what Hildesheim Cathedral was like before it was Italianised. Here we find the narrow round arches dividing the nave from the aisles, carried on columns, of which two cylindrical ones alternate with a square pier. Above these arches a considerable space of wall is left for fresco or mosaic-work, and surmounting the whole is a clerestory of continuous round-headed windows. As is the case with the generality of basilicas in this part of Europe, the roof is of wood and flat, enriched, however, in the case of St. Michael's with that renowned painting which served as *motif* to Mr. L'Estrange when about to undertake his great work in the nave of Ely.

The journey from Hildesheim to Halberstadt was broken for a short time at Goslar, whose beauties—so picturesquely does it nestle beneath the Harz mountains—were sadly marred by the pitiless rain. I contrived, however, to see the churches, each of which is distinguished by that curious quadrangular form of western façade which, flanked by pinnacled turrets, rises considerably above the apex of the roof of the church it screens.

This is a type of western front very common in the Harz district, extending likewise to Halberstadt and Brunswick, and penetrating even to the Low Countries, where it may be looked for in St. Servatius and Notre Dame at Maas-tricht.

If Hildesheim was delightful, Halberstadt was doubly so, for here I found myself among some of the best German Decorated work, as evidenced in the Dom and the two long, unclerestoried churches built by the Dominicans and Franciscans.

There was also some interesting but rather rude Romanesque in the Liebfrauen Kirche and the now secularised Paulus Kirche, both of which show the lofty turret-flanked western screen-façade just alluded to.

The Dom is now Lutheran, but the choir retains all its old furniture of stalls, bishop's throne (situated facing the altar, with its back to the rood-screen), tapestry, triple-branched candlesticks, stained-glass, &c. But next to the sacristy, where are preserved perhaps the most magnificent collection of eucharistic vestments, copes, mitres, altar and processional crucifixes, tapestry, pyxes, reliquaries, &c., in Northern Europe, the glory of the Dom at Halberstadt is its rood-screen, or Lettner, having, according to German custom, the entrances to the choir on either side a central altar—called, where the cathedral is Catholic, the people's altar. The whole workmanship is typical fifteenth-century German, and the rood which soars above is so verily a Tree of Beauty that to no other in

Europe does that verse of Venantius Fortunatus's "Vexilla Regis" seem more applicable:—

Arbor decora et fulgida,
Ornata Regis purpura,
Electa digno stipite
Tam sancta membra tangere!

Railway arrangements gave more time than I wanted at Halle—a place against which I warn those in search of fine architecture, none at Merseburg or Schulpforta—and hurried me at Naumburg, where treble the hours allotted to me there would not have sufficed for thoroughly mastering the beauties of what I consider one of the most valuable and interesting churches in Saxony. For this there was no help; circumstances obliging me to be at Erfurt by Saturday night. Journeying from Halle to Naumburg in the brilliant summer noontide, I again essayed the fourth class, whose occupants, this being market day, afforded scope for

endless speculation and amusement. There was music, too, not of a high order, to be sure; still, it was lively and joyous, and to its strains the villages and towns seemed to dance as the train approached or left them. Arrived at Naumburg, I hurried up to the cathedral, anxious to spend every available minute of the time in and about it. It being Protestant, the key had to be sought. This having been obtained, I made a leisurely tour of the interior with its female custodian, who was neither officious nor obtrusive, but very intelligent and anxious to give all the information that lay in her power. During our inspection some other visitors arrived on the scene of enchantment—a German lady and her son, residents in the town, the former of whom spoke English very tolerably.

Not being sufficiently *au fait* at German to indulge in what Miss La Creevy revolved as she walked along on that memorable morning of her interview with Miss Knag at Madame Mantalini's, *i.e.* "genteel turns of expression," I begged the aforesaid lady to communicate to me—what shall I call her?—vergeress my thanks for her politeness and attention, and apologies for my long detention of her—two hours, I think—in the church. This she did, and in consequence the ardent ecclesiologist was quite overwhelmed with courtesies and civilities, whether at the liberality of the donation or not

history is silent, on taking his departure.

Naumburg is a double-choired church—a distinction it shares with Laach, Mayence, Worms, Oppenheim, Gernrode, Hildesheim (St. Michael), and Bamberg, to which last-named cathedral that of Naumburg bears in many respects a great resemblance. Early in the thirteenth century a nave, exhibiting that mingling of Romanesque and Pointed observable in such contemporary works as Münster and Osnabrück, was inserted between too much older apses or choirs. These Romanesque choirs gave place during the latter part of the thirteenth and the middle of the fourteenth centuries to lightsome erections in First and Second Pointed respectively. Of the western choir at Naumburg it is not too much to say that for elegance and refinement of detail, as well as for purity of design, it is unequalled by anything else of the period in Germany, being as it is in that rare style, First Pointed, ...

INTERIOR OF CHURCH OF ST. GODEHARD, HILDESHEIM.

A rood-screen or Lettner, with the crucified Saviour and attendant figures abnormally placed between, and on either side, the central doorway, separates this western choir from the nave. It is coeval with the choir, and is quite the loveliest thing of its age and class. The altar in the apse of this choir was vested in a magnificent old crimson frontal with saints in the orphreys, and upon it stood a crucifix between two candles. Separating the nave from the eastern choir is another and much older Lettner (Romanesque in fact), having its doors placed eccentrically with an altar between them. The choir is not, however, entered by these doors, but from the transept, and by a steep flight of steps as at Paderborn; a mode of approach rendered necessary by the crypt, which is a rich specimen of Romanesque work. Some idea of the non-subterranean situation of this crypt at Naumburg may be gained from the fact that the floor of the eastern choir is on a level with the top of the Lettner. This eastern choir is delicate Middle Pointed, its apse terminating triangularly. The three-light windows

the conditions under which I first saw them having an air truly stupendous. There is but little Romanesque work in the Dom, and indeed throughout Erfurt, fourteenth-century Middle Pointed having the ascendancy.

The nave of the cathedral is a "hall" one of the fifteenth century, and not a very good specimen of its class; but entering it, as I did, in the early morning light through that celebrated saint-guarded triangular northern portal, so familiar to us by the drawings of Norman Shaw, the ensemble presented by its clusters of reedlike shafts, tinged with colour from the tall painted windows, was exceedingly striking and awe-inspiring.

But the glory of the Dom at Erfurt is its choir, beyond question the grandest and most harmonious of those lantern-like, aisleless structures that the fourteenth-century German architects were so fond of rearing. Its walls being set back considerably beyond the line of that transeptless portion of the church between it and the nave, the choir of Erfurt Cathedral cannot be adequately seen from a distance, appearing much

INTERIOR OF THE DOM, HALBERSTADT.

retain much old painted glass, and the general aspect of this part of the church, with its stalls and bishop's throne placed, as at Halberstadt, in the centre of the choir at the west end, is remarkably picturesque.

The church has four steeples, but as I shall have occasion to refer to them later on when remarking on German towers generally, I shall not now allude to them nor to the *entourages* of this most interesting building, from which it was only with great reluctance I could tear myself away and once more take the train.

By the time Erfurt was reached darkness and rain were falling; so, jumping on to the footboard of an electric car, I was whisked through streets of brilliantly-lighted shops crowded with Saturday night purchasers to the Friedrich Wilhelm's Platz. Here I alighted, to gain that comfortable hostel, the Thuringia Hof, situated just below the great Dom and its adjacent St. Severus, both buildings from their elevation and

foreshortened, so that it is only when the visitor has advanced to the screen—a veritable *cancelli*, of which more anon—that the full magnificence of this imposing erection, with its noble stallwork and tall Middle Pointed windows, mostly retaining their original glazing, bursts upon him.

Curiously contiguous to the Dom stands St. Severus—so close in fact that, viewed from certain points, the western façades of the two buildings seem to touch each other. St. Severus, however, inclines considerably to the north, so that there is plenty of room between the structures at their eastern portions. St. Severus is not a particularly remarkable Middle Pointed church, its most striking features being the inclusion of its five aisles beneath one enormous steep roof, and its steeple, an oblong piece of masonry from which sprout up a triplet of small towers surmounted by extremely tall slate spires, which, taken in conjunction with those of the cathedral—similar in point of construction and "restorations" of the present cen-

tury*—forms a group as curious as it is unexpected. Both these churches are Catholic.

In the lower part of the town are the three noble churches—now in the hands of the Protestants—of the Augustinians, Dominicans and Franciscans. The leading features of these three Middle Pointed structures, upon which I anticipate dwelling more fully later on, are their unbroken line of tiled roofs, their noble western elevations, their clerestories, their tall, somewhat narrow aisles, their luminous choirs ending in polygonal apses, and their charming little octagonal bell-turrets, which, placed against the clerestories, do duty for steeples. Besides these churches, there are others of minor importance, small in scale but good specimens of Saxon Decorated work.

From Erfurt a rather tedious journey through Eisenach, Coburg and Warburg—taken perforce in a single day—brought me back to Paderborn, whence, after another visit to what I call my favourite German cathedral, I caught a midday train to Soëst, and spent a loto-eating afternoon wandering about its quaint streets, and renewing my acquaintance with its ecclesiology. I quite envied the vulgar children who were playing and screaming beneath the shadow of the old steeples—Sir Peter Lely did the same most probably—but alas! as is the case too often in this world,

What's most posset 's enjoyed the least.

With this reflection I comforted myself as the train steamed out of the station on its way to Aix-la-Chapelle, whence, with brief stoppages at Louvain and Bruges, I returned to England after having made the tour of which I have endeavoured in the foregoing notes to delineate a faint outline.

(To be continued.)

DESIGN IN LETTERING.†

(Continued from last week.)

I PROPOSE now, in the first place, to show you just a few pages, or parts of pages, of lettering showing the more decided steps in the progress of the alphabet.

Our printed type takes, as you know, two forms—a larger and a smaller, major and minor, or as printers put it, capitals and “lower case”—because the small letters, being those most continually in request, are kept for convenience nearest at hand—in the lower part, that is, of the case from which the compositor, so to speak, feeds himself.

Our written character takes the form of a “running” hand—and is known by that name.

Now the printer's “lower case” or “minuscule,” as it is also called, is practically the book-form of running-hand, except that the letters are quite separate and not conjoined, as they are in what pretends to be only the hand of the ready writer, and does not claim to be beautiful at all.

The earlier form, whether of Greek or Roman lettering, was the capital—those more or less square letters, with relatively few curved shapes, which were most convenient to cut in stone or engrave on metal. It is, in fact, the monumental style—adapted to, and, what is more, inspired by, the chisel or the graver.

Even in the sixteenth-century version of it on the screen (in which the rounded D and other details show Gothic influence) you see at a glance how eminently fit it is for its purpose; you realise at once that that is inscription. Manuscript writers adopted for book writing a different character, or rather they adapted the square capital letter to more ready execution with the pen, and so evolved a rounder kind of letter, which is known by the name of uncial. The word “uncial” is supposed to be a corruption of “initial,” but the use of uncial letters does not support that derivation. I show you an instance of exceptionally beautiful small or round-hand Greek writing, “cursive” as it is called, in order that you may compare it with the more stately uncial writing. This form of letter was commonly used in Greek MSS. of the tenth century.

The uncial form of writing is intermediate, you will see, between the monumental writing and the “current” hand of the ready writer. It is, if not the step between the two, a compromise between them—no matter which. What it concerns us to know is that calligraphy took that form—which goes to explain many a later form of letter widely differing from the original square type.

It does not so much affect the modern printer; but it is the form of letter from which the artist who prefers his own handiwork to that of the printing press has probably most to learn.

Even when the Romans used, as they sometimes did, the square capital form in MSS. they did not confine themselves to

the severely simple shapes which came natural to the lapidaries.

The unequal strength of the lines, the thickening of the strokes at the ends and the spurred or forked shapes they take all speak of the pen—not the steel pen of course, nor yet the more supple quill, but the reed pen—rather blunter than a quill, but pliant enough and less given to spluttering—and it did not tempt the writer to indulge in unduly thin upstrokes.

The smaller uncials you will see are own brothers to the Greek letters just shown.

A further example illustrates another form of square capitals employed by the Romans in MSS. of the fifth and two following centuries. They are known by the name of “rustic” capitals—not that there was anything rustic about them in our sense of the word; but the Latin word was used in the sense of free and easy, *sans gêne*. The character of the writing, that is to say, is not so formal as would befit the town, it is a kind of country cousin; it stands, let us say, for the Roman capital in a loose coat and a soft hat. The rustic writing shown is of the fifth century. The characteristic points about it are that the vertical strokes are all very thin, and the cross strokes broad. These cross strokes take the form of a kind of tick, tapering at the ends; and similar ticks are used to emphasise the finishing of the thin strokes. The A has no cross stroke, but is like an inverted V. F and L rise above the line. The I wants knowing—then you can read it. The T and L are none too easily recognised. That all of this is pen-work is, I think, self-evident. But, as before said, the more usual form of penmanship is the uncial letter.

Roughly speaking, capitals represent the first accepted form of letter engraver's or carver's work, whether Greek or Roman.

Uncials stand for MSS. writing, scribe's work, growing rounder by degrees; whilst the smaller minuscule letter, our “lower case,” was evolved out of the running hand of the business, as distinguished from the literary scribe. This last was not used by the ancient Romans, and it was not till towards the eighth century that it was thus, as it may be said, reduced to order.

Running hand hardly concerns us. “Cursive” it is called; it might be called discursive, it is so apt to run wild. It tells us less of the artistic progress of lettering than of the caprice or carelessness of the individual writer.

There were various ceremonial versions of the running hand employed by the writers of Papal Bulls and Royal Charters—“diplomatic” hands they are called, because diplomas were written in them; and some of these, and the so-called “Chancery” hands, are highly elaborate if not ornamental; but they are so illegible, so unlike familiar forms of writing, that it would be hopeless to try and discuss them briefly, and it would serve no useful end.

With the decline of the Roman empire came naturally the demoralisation of the Roman character—capital or uncial—and just in proportion as Rome ceased to be the one centre of the world, and the Frankish and other nations rose into importance, so their writing began to show signs of nationality. At the loss of some refinement we now get variety of character. By the beginning of the eighth century we get distinctly national styles of lettering.

To subdivide these styles so minutely as some learned antiquaries do is simply to bewilder the poor student by their multitude. The important European races were the Latins, the Franks, the Teutons and Anglo-Saxons and the Visigoths; and so we get the Lombard, the Frankish, the Teutonic and Anglo-Saxon, and the Visigothic types of writing—all of which eventually merge themselves in what we call Gothic, though we may still distinguish between Italian, French, German, English and Spanish Gothic.

I will show you specimens of some of the earliest national styles. First the Lombardic—that is the term commonly used to describe the form of lettering which prevailed in Italy from the eighth to the eleventh century. It might be taken to imply that the style of it was in some sense the invention of the Lombards. That was not so at all. They were just long-bearded conquerors, and invented nothing. The style was not even confined to northern Italy; but it happened first to be developed there, and so all later Latin writing (after the empire) was called “Lombardic.”

Uncial writing, I told you, was transitional between square “caps” and rounder pen-forms. The Lombardic shows a further stage of transition. The penman has not quite made up his mind between straight lines and curved; he hesitates between the square-lined M and N and the rounded forms. Eventually he decided for the rounded form, which in its later development we distinguish by the name of Lombardic capitals.

In another form of Lombard writing, “Lombard brisée,” as the French call it, is foreshadowed the “black letter” or Gothic form. Its name is justified by the broken back of the letter, in which, as I said, you see the beginning of that later Gothic “lower case” which we call black letter.

* Puttrich's book on the architecture of Saxony shows the central steeple of Erfurt Cathedral wanting in its triplet of pinnacle-like spires.

† Abstract of a course of Cantor Lectures, by Mr. Lewis Foreman Day, published in the *Journal of the Society of Arts*.

Our own "lower case" we get more or less directly from Charlemagne, who was crowned you know in the year 800. He found—perhaps his friend the Pope told him—that writing by that time had degenerated to a state unworthy of a mighty emperor, and accordingly he ordained its reformation. He went so far as to compel bishops and other important personages who could not write decently, to employ scribes who could. In this way he revived the small Roman character which we eventually adopted for our printed type.

The scribes of Charlemagne (and for some time after him) did not yet manage to get very satisfactory capitals. They still mixed up letters all of one thickness with others in which thick and thin strokes, or diminishing strokes, were used in a most illogical and awkward way—indicative, of course, of a period of change. But they did arrive at a satisfactory and very characteristic rendering of minuscule lettering. A conspicuous feature in it was the elongation of the longer limb of the *l p q f d*. Tails, that is to say, came into fashion, and long ones, as much as four or five times the length of the body of the letter. We get now also the long *s—f*, though the *t* does not rise much above the line, sometimes not at all.

That elongation of the up and down strokes is characteristic of Frankish and Visigothic lettering generally. It occurs even in the case of capitals, as in the headlines of the tenth-century MS. on the screen. There you see the *I*, the *H* and the *L* rise high above the heads of their fellows, whilst, on the other hand, the *V*-shaped *U* in the word *Opvsculum* is reduced to more than modest proportions.

Visigothic lettering, of which that is a good example, shows, it seems to me, usually a trace of Moorish influence, betraying itself, to begin with, in the liberties taken with the proportion of the characters; the Moors, remember, had by that time overrun the whole of Spain.

You will see in the alphabets on the screen the rather freaky character of Anglo-Saxon lettering—sometimes mechanically square in form, sometimes exceptionally flowing and even frisky. Anglo-Saxon lettering, I should say, was affected by lingering traces of an obsolete alphabet derived perhaps at some remote period from the Gauls, which, to judge by internal evidence, must have been something like the Greek—but I need not go into that, letters so unlike ours do not much concern us.

A couple of pages of a seventh-century copy of Gospels show the character of the Saxon minuscule lettering. There is a curious twist in the long stroke of the *b* and *l* which here does not rise above the line at all.

By the thirteenth century the Gothic style had formed itself. In the next hundred years or more it perfected itself. At the end of the fifteenth century it was still flourishing—flourishing was the word literally, and in the sixteenth it was sometimes all flourish. I show you some late German letters. It takes an expert to read them. Some of them happen to be upside down. It is no easy matter to say which.

But I am getting on a little too fast. I have two or three examples of "Lombardic capitals," as they are called, to show you. These were used as initials. In their simplest form they were just in red; often they were filled up with linework in blue, or more elaborately illuminated with gold and many colours; but it is the form of the letters themselves to which I wish to call your attention now. The swelling and bulging of the lines is as characteristic as the spring of their tails and other extremities. To this period belong also the "closed" letters characteristic of thirteenth and fourteenth-century Gothic writing.

Lombardic capitals were not used only for initials; inscriptions were written in them entirely; in fact, it was not till the fifteenth century that inscriptions were commonly written in minuscule letters. Observe that this is not pen writing. It is done with a brush, and there results a very distinctive character; the letters are fatter than pen letters.

Contrast the Lombardic capitals with a rubbing from a Flemish brass, also of the early fifteenth century, in which you see there are no capitals at all. The even perpendicularity of the straight strokes gives at a glance the character distinguished as "black letter;" there is, of course, relatively much more black about it than there would be in an inscription in Roman character.

Another Flemish Gothic brass shows the association of similar lettering with capitals. The simplicity of these Gothic capitals argues that it belongs to not too late a Gothic period. Further inscriptions in Lombardic capitals are shown in the stained-glass from the Sainte-Chapelle at Paris, undoubtedly of the thirteenth century.

You will see that the letters are sometimes joined together. We have abandoned that kind of thing, except in the conjunction of *Æ* and *Œ* diphthong, and writing is all the easier for it; but there are ornamental possibilities in the linking of letters not to be overlooked.

The next diagram on the screen is by way of reminder that the Gothic scribes used two forms of smaller letter—rather that their manner varied so that it presents forms very different in appearance. According as the writer considered

ease of writing he approached the rounder of those types, the more cursive. If regularity was his first thought he adopted the latter, the more straight-backed. The latter form went rather out of fashion for awhile, but it was revived by the printer, who saw in it what he could best imitate.

The page of late German Gothic lettering shown has quite a national twang about it; it is a noble bit of black letter, strong and manly as one could wish. But there is something rude in its strength when you compare it with the Italian MSS. which follows. That is strong in a simpler way, more refined, more perfect, not so Gothic perhaps. There is an elegance about Italian Gothic lettering—see the capitals, for example—which is not characteristically Gothic. The difference of nationality is very plainly marked in two contrasting specimens.

By way of prelude to some examples of printed type, I will show you just two or three specimens of the fifteenth-century penmanship. The first are from German missals of towards the end of the fifteenth century; both of them are excellent and not too florid. The capital letters in the upper one you will see are rather frisky, but being distinguished from the rest of the type by their colour, those tails would not cause confusion in the ranks. Even the crosses introduced at erratic intervals, certainly in a very decorative way, would not so much interfere with the wording in red as they do in the photograph. In the lower instance you may note how decorative is the use of the four heading lines of the page in letters three or four times as big as the rest. Compare with these the Italian MSS. next shown, rather earlier in date—1450—but Roman in character, you see.

I need not explain to an audience such as this how in the sixteenth century (and much earlier in Italy) the Classic manner of design generally was revived, and with it of course the style of lettering. Enough to note that at the time of the introduction of printing the two styles were in use for MSS., and so two styles of printed type arose.

The type we use nowadays has come about in a more or less accidental way. In the first place it was a copy of MSS. forms. That was inevitable. Possibly printers were anxious to palm off their printed books as MSS. But apart from any such intent on their part, their text was bound to follow the written page, or no one would have been able to read it.

The printed psalter, of which a page is shown, bears obvious resemblance to the two MSS. specimens shown three slides back. This was printed by Schæffer in 1457. It is the first book with date and the earliest specimen of printing in colours; the big initial *B* is in red and blue.

The black letter and the Roman types, as the printer first conceived them, are both shown on the screen together for comparison. The topmost of the two is from Schæffer's Bible, 1461. My friend Mr. Emery Walker considers it perhaps the best of the black letter founts.

The lower, by Jensen, 1470, is one of the best Roman. There again we have the heading lines of large type. You see when you compare the two that the black letter is blacker.

A supplementary slide shows you on a rather larger scale specimens of the same two founts with another between them of intermediate character—not so angular as the one, not so round as the other. That is by Sweynheim and Pannarts, who were the first to print in Italy. All these are obviously very much in the likeness of MSS. writing.

The Gothic lettering next shown is French and not so aggressively Gothic as some writing and printing of the period. It is of the year 1486.

A more rigidly Gothic type is the specimen by Wynkin de Worde of Westminster, 1486. That is English, you see, and is typically "black letter."

A further example of English work is from Caxton's "Dictes of the Philosophers," the first book printed in England.

That will be enough of type printing. I have shown examples enough to illustrate the variety in it.

When I was a boy, I remember, I thought there were so or so many alphabets; I had no notion as to how many, but I had no doubt about there being a fixed number; and I have a very distinct recollection of hesitating to buy a book of alphabets (which I coveted) hoping to find one which would include them all. It did not occur to my youthful mind that in the year 1300 or 1400 the recognised forms of lettering had never yet been stereotyped and that each individual scribe was at liberty to play variations on the well-known alphabetical tune. That is just the difference between lettering ancient and modern, that we are not allowed to play variations; and that is why our types are so monotonous.

In the case of type-printing that must be more or less so. But I think it might be less; we need not go on copying copies of copies of copies of copies, from which all the virtue of vitality and freshness has died out. That is how we arrive at the Victorian newspaper type. Compare it with the early founts and ask yourselves if that is any credit to this year of Jubilee. I don't feel very jubilant about it. Let us found ourselves at least upon the best types and let us go straight to them for inspiration. We have got to go on.

Pedants want everything to be fixed, but nothing is fixed until it is dead. Then let it be decently buried. Life is in movement. We have long since given up the idea of perpetual motion, but that is the secret of it—life. And that is the evidence and sign of life—motion. The question is, Are we alive?

I have alluded to the influence of the way writing was done upon its shape and character, more especially in reference to the implement employed in writing. I must illustrate that a little more plainly, for it is of infinite importance in design.

The earliest writing was most probably scratched with a point upon whatever was handiest—skins, palm-leaves, the bark of trees, and especially upon clay—a material which, when it was baked, was more lasting than stone. We have to-day at the British Museum any number of clay tablets or Babylonian "bricks," covered with minute and most voluminous inscriptions.

To the left of the screen is what purports to be the most ancient inscription extant (B.C. 4500). That is a very rude drawing taken from the *Daily Chronicle*, but you can see that the signs are all scratched—there is no doubt about that. The smaller inscription at the top of the screen, to the right, is seven or eight hundred years later. In that you see the wedge shapes from which the cuneiform writing of the Assyrians takes its name. That is described, you see, as a "brick stamp," but the drawing is too rude to show how it was done—whether stamped, scratched, or cut. If, in scratching on firm clay with a sharp instrument you begin with a dig, and, as it were, drag the tool along, you get a more or less wedge-shaped scratch, and that may very well be the way the cuneiform lettering came about; but the British Museum "bricks" (as they are called) are so precisely and sharply defined that they must almost certainly have been cut.

You will see in the various cuneiform inscriptions lower down, on the same side of the screen, divers wedge-shaped or arrow-headed characters, taken from what are said to be facsimiles of sculptured writing. But the more common Ninevite form, as found in the famous sculptures which we have at the British Museum, is neither forked nor rounded (as these reproductions have a tendency to be), but consists, as in the diagram I give you, of, for the most part, merely three-sided digs into the stone. In fact, it is "chip carving" of the simplest kind, born and bred of the chisel.

From that to the simple Greek or Roman capital, as square as well could be, is not far. Early Greek inscriptions on granite are sometimes not much more than scratched in the stone.

The small Greek character on the famed Rosetta stone is mere scratching. Larger and deeper-cut lettering is still typically chisel-work though no longer simply chip carving.

The writing with a stylus on tablets of wax was naturally blunt. Penwork at first was also much blunter than modern writing, owing partly to the pen used (a reed) and partly, it seems, to the texture of the material on which it was written. At all events, the early writings on papyrus (Egyptian, Greek, Latin) are bluntish—the lines rather equal in thickness, the points not sharply turned, but rather rounded.

The Arabs wrote with a reed pen held more or less horizontally so as to hold the ink. The paper or papyrus was held at an angle. It was in writing the Roman letters with a reed pen that the Mediæval scribes gave it its Gothic character. When quills (which hold the ink better) came into use it enabled the Italians to develop their minuscule.

In the diverse specimens of early Egyptian hieratic writing shown you will see there is considerable variety of character. The lettering in the darker scrap of papyrus is unmistakably the outcome of the brush, and, curiously enough, it is written in vertical columns, just as Chinese and Japanese writing is—which also is brushwork. By the way, the Chinese had also an almost perfectly rectangular form of writing, which was their monumental manner. The inscription to the left, below the last mentioned, proclaims itself penmanship. Two inscriptions look as if they might have been dug out of clay with a round-pointed instrument. More likely they are cut in stone which has been weather-worn.

I have amused myself by designing an alphabet, near enough I think to ordinary Roman lettering to be unmistakably readable, based on the idea that it can be cut in the simplest and most direct way on fairly hard stone. The letters are shaped, that is to say, with deliberate view to their direct and easy expression with the chisel. I take the Assyrian cuneiform character, and its invariable use for inscriptions to be cut, as proof of that being a convenient form of letter for cutting. It is noteworthy that Assyrian inscriptions painted on bone are not cuneiform, whilst those cut in bronze are.

The suitability of the straight-backed Gothic letter to engraving on brass is plainly shown in the engraved brasses of the fifteenth century, and you get a precision in the detail which is characteristic of the graver.

In some of these it is the background of the letters which is cut away, whilst a well-proportioned band of bright brass holds them together. The taller letters cut into this. The letters themselves are in some cases slightly engraved, so as to suggest that they consist of straps which turn over. That is a

tune upon which the writers of the fifteenth and sixteenth centuries played many variations.

Gothic still, but very different, is the French black letter shown. Clean as the work is, there is not that metallic precision about it, though the incised letters are very squarely formed. The fact is that they are cut in slate; and you can see it in the comparatively soft lines of the curling tops and tails of the taller letters.

A yet more beautiful inscription, also French, is yet more suitably treated. There is no reason why in soft stone the letters should not be rigidly square; and these are not. There is here more the freedom that you get in penwork, of which you yet trace the influence. Still it is not penlike, but obviously and beautifully what it is, viz. cut in.

The painted inscription in Lombardic capitals is very different, but you never suspect this of being cut either in stone or brass.

You can see again the influence of material upon design in the big D on the screen. That is a simple block for printing or stamping on to linen an initial (afterwards to be embroidered?). It is made for French peasants and sold in market-places for two or three sous—the workman himself a peasant. It consists of strips of thin flat wire driven into a chunk of deal, roughly sawn across the grain, so that the metal-tape easily finds hold. But see how simply the design follows the process employed, the easy curves which lend themselves to it. The type of the letter is commonplace, but it is the commonplace type best suited to that way of working. So with the added decoration. The workman (and those to whom he appealed) would probably have liked the sprig of foliage more natural, but the wire would have it so; he followed its promptings, and was something of an artist, almost in spite of himself.

I have attempted to design an alphabet especially suitable to wood. The suitability of strapwork to wood-carving is shown in instances innumerable of Elizabethan, Jacobean and especially Henri II. wood-work. The slightest modelling on the surface of the slightly raised pattern is for many purposes quite enough. There, at all events, is lettering adapted to the simplest expression in wood-carving, and that simple expression dictated its design.

The Arab penmen took great pride in their penmanship, and their writing shows the wonderful elasticity of the pen. They seem to get out of a reed pretty much all that a brush will give. One is reminded of brushwork by the characters on the screen, but they are yet more like broad penwork—though here woven in silk; and very beautiful decoration this *neskhi* character makes. The Arabs had also a squarer *cufic* form, which I take to have been originally the monumental or sculptural form.

The letters on the old English sampler of the seventeenth century are clearly adapted to needlework; their angularity, as well as the peculiar form of that angularity, is begotten of the canvas on which the work is done, and characteristic of a simple class of needlework. Very different is the other needlework example. The needleworker has the choice of two very opposite kinds of lettering, the one rigidly square in outline following the meshes of the canvas, the other carefully avoiding anything like a right line which it is difficult to get right except in the way last shown. This flowing letter is well adapted to working on a material of which the mesh is not apparent. There is good reason for here avoiding the square line, and even flourishes are excusable.

The alphabet in gesso is suggestive of the way it is done. It is easy with a long-haired brush and a thick creamy composition of glue and plaster to trace fairly even, fat, bluntish lines. Of such lines I have devised an alphabet, naturally of rather a curly character. To have tried for sharpness would have been foolish. Just such an alphabet as this (it might be much more elaborate) would lend itself to execution in raised cord (single or double) sewn down or "couched" upon a textile ground.

Two more examples and I have done. The first a sixteenth century version of the Greek alphabet, just that you may see its simple, square and clean-cut lines. Comparing that with the lettering on the coins next shown it might seem to you that the die sinker had, say in the coin at the bottom of the screen nearest to me, set himself to elaborate a much more ornamental form of letter rounded at the points in a curious way. But he had no such ambition. That simply happened so. The fact is the artist worked with a drill and a wheel, and in cutting the very short strokes of which the letters are made up, he would be likely with the wheel to overshoot the mark. It was a safe plan to drill holes at the points and then to engrave a line from hole to hole. From that comes a character which he did not think it worth while to efface.

It is time now I came to an end. I shall have an opportunity in my last lecture of referring again to the influence of the tool upon the alphabet. Enough for the present if I have impressed upon you how inevitable that influence is, and the character it gives to design.

(To be continued.)

NEW CHURCH AT BASSETT.

A NEW church is in course of erection on the east side of London Road, Bassett, situated between Red Lodge and the turning to North Stoneham Park, of which Mr. E. P. Warren, of Westminster, is the architect, and Messrs. Holloway Bros., of Battersea, the contractors. The new building, the foundation-stone of which was laid on the 29th ult., is dedicated to St. Michael and All Angels, and has been designed with a view to making the most of the congregational area. It is to be roofed with a groined vault, and the deep buttresses built to resist the thrust of this vault are placed internally and pierced with arches to form continuous narrow passage-aisles, the outer walls of which are mere screens or "curtain walls" connecting the buttresses, and roofed over with a low-pitched roof immediately below the tall nave windows. The nave is thus divided into a succession of deep arched bays. The chancel, which is a direct continuation of the nave, is formed by omitting the passage-aisles and making the side walls almost flush with the inner faces of the buttresses, at the same time raising the floor and providing steps for approach. The nature of the structure has, in view of the exigencies of the case, been ruled by the strictest considerations of economy, and there has been no desire or attempt to follow an historic style. The materials are local bricks, red for external facing, and Monk's Park stone for all dressed work of doorways, windows, &c. The roof will be covered externally with green slates. It is only at present possible to build a portion of the church, the south transept and the two westernmost bays of the nave being omitted. The edifice when completed will be 99 feet long and the nave will be 25 feet wide, and with the aisles added the total dimensions across will be 37 feet. There is no tower in contemplation, but it is finally intended to have at the west end a stone bellcote on the gable.

THE GOVERNMENT LABORATORY.

A BLOCK of buildings has been erected on a site adjoining King's College Hospital, which contains laboratories for testing excisable and dutiable articles. It occupies a site of about 7,900 square feet, and its various rooms, thirty-eight in number, and capable of accommodating about 100 workers, are distributed over three floors and a basement. The building externally is befittingly simple in character, and with the exception of the entrance, which faces Clement's Inn, is altogether devoid of any attempt at ornamental treatment. On the ground floor are situated the office of the principal chemist, the deputy principal, a small reference library, the research laboratory, the Crown contracts laboratories and the laboratory for the examination of food and drugs sent by magistrates under the Adulteration Act of 1875. Samples of imported butter taken by Customs officers at the port of entry at the instance of the Board of Agriculture are also examined in this laboratory, as are samples of fertilisers and feeding stuffs referred in accordance with the Act of 1893.

The first floor is wholly reserved for the examination of alcoholic products and manufactured tobacco. The alcohol laboratory, arranged for thirty-two workers, is a lofty, well-lighted room, with conveniently-disposed work-tables fitted with various contrivances for the rapid and accurate examination and analysis of brewing materials, worts, beers, wines, tinctures, medicated wines, compounds, &c. In the same laboratory is conducted the examination of the wood naphtha required for the methylation of alcohol. Round the room are placed the balances needed for the estimation of density, &c. and under each window is a table for the clerical work of the analysts, special arrangements being made for the keeping and preservation of the official registers. Immediately adjoining are the polariscope room and an artificially cooled chamber, capable of holding some thousands of samples pending examination. Close to the entrance of the main laboratory are the offices of the superintending analysts, each fitted with a working bench and with presses for the custody of microscopes and special apparatus. Next to these are the tobacco rooms. In one of these the incineration work, required for the determination of sand and inorganic matter, is conducted in muffle-furnaces fired by gas. The estimations of moisture in manufactured tobacco, instituted in 1887, are also conducted in this room, the samples being heated in a series of jacketed steam ovens, arranged to work continuously night and day. The main tobacco laboratory is fitted with appliances for the examination of manufactured and the so-called "offal" tobacco for determination of drawback and for the detection of fraudulent or improper admixtures.

On the second floor are placed a number of special rooms, a museum of specimens of adulterated foods and other products, a small class-room for the instruction of supervisors, a type-writing office and a room for the preparation of micro and other photographs.

In the basement are situated rooms for the standardisation

of the instruments employed in the Revenue Service and laboratories for the chemical and bacteriological examination of waters sent by the Prisons Department of the Home Office, the Board of Trade, Office of Works and other public departments. There is also here provision for operations requiring a high temperature, as in furnaces, oil and air baths, &c.; a small mechanical laboratory, rooms for the storage of chemicals, apparatus and stationery, and of samples required to be preserved either for purposes of reference or pending prosecutions. Lastly, there is a small boiler-house and engine-room, ventilating fan, refrigerating apparatus and ice-making machine, and a lift placed near the receiving-room and delivering on each floor of the building.

Particular attention has been paid by the architect, Sir John Taylor, to the arrangement and fitting of the new laboratory, and there is provision for the introduction of all the machinery and apparatus required for modern analytical operations. It is amply furnished with draught places, evaporation closets, filter-pumps and the other paraphernalia required in a well-appointed chemical laboratory of the present day. The heating, lighting and ventilating arrangements have been carefully planned, as well as the systems of supply of water, gas, steam, and electricity and of drainage, and the operating tables are fitted with various contrivances, some of them of original design, in order to expedite the work or to increase its accuracy.

The whole building is interesting as being the first State laboratory in this or any other country which has been specially constructed for the purposes it has to serve, and the mode in which it has been equipped and finished reflects great credit on the Office of Works.

TESSERÆ.

Taste and Architecture.

IT has been deemed a fruitless task to reconcile to a principle the varying opinions current upon the same object in arts each of which is termed the opinion of taste, because of the different degrees of sensibility and imagination found in different minds, and because it has been observed that the same object which is viewed carelessly by one man fills another man with exquisite delight. Strange as differences may appear, they are all to be traced to one source. The taste of a man, which is a progressing principle, receives its perfect development only from time. Taste which in infancy is mere sense becomes improved as imagination and reason blend to assist it. Taste resulting not from a simple idea, but from the union of reason and imagination, varies then not according to that chance inseparable from a simple notion, but according to the effort of the imagination and the exercise of the judgment, the latter quality of the mind being a determinable thing, whose degree of ability is proportioned to the attention and care bestowed. Imagination, too, though a power extremely elastic, resembles when engaged with architecture either more or less that faculty we denominate "taste," for its essential power then lies in tracing resemblances, and it is either perfect or advancing towards perfection, according to the degree of judgment in simultaneous exercise. Thus taste is subject to degree, and according to this degree of taste in different individuals, we find the degree of refined pleasure which a work of art produces. Taste which is a habit is therefore imperfect taste, because inimical to progression. Hence habit, which is the origin of our views in a great measure, may explain the source of our architectural taste. Independently of this definition of taste, and the grounds of its support, there is a further difficulty attendant upon its application to architecture, from the circumstance of there being little or no direct appeal to the sympathies which the painter, the poet and the sculptor so powerfully affect, and which the rudest mind intuitively feels without previous study to acquaint him with the source of his emotion. This is one reason why public opinion varies so much; men untaught, with their judgments unassisted, feeling that emotion is the object of the art, are precipitated into hasty conclusions just because their sympathies cannot be awakened. A correct taste in architecture is more difficult than in any other art, because the ideal resemblances affecting the mind are more remote, and this is the reason why taste is pleased by figures, pictures, statues or striking ornaments, to the prejudice very often of a taste strictly architectural, the mind being conducted towards familiar objects. The essential difference between architecture and the other poetic arts consists, then, in this suggestive character, whilst the poetry it exhibits appears in expression, attitude or relative position. It has, however, all the attributes of the other arts at command, and which it makes subsidiary; and thus its claims to criticism are as strong and as important as the noble art of the painter or the sculptor.

Michel Angelo and Oil Painting

When Michel Angelo pronounced oil painting to be "Arte da donne e da huomini agiati e infingardi" (an art fitted only for women and lazy men), a maxim to which the fierce Venetian manner has given an air of paradox, he spoke relatively to fresco. It was a lash on the short-sighted insolence of Sebastian del Piombo, who wanted to persuade Paul III. to have the *Last Judgment* painted in oil. That he had a sense for the beauties of oil-colour, its glow, its juice, its richness, its pulp, the praises which he lavished on Titian, whom he called the only painter, and his patronage of Fra Sebastiano himself, evidently prove. When young, Michel Angelo attempted oil-painting with success; the picture painted for Angelo Doni is an instance, and probably the only entire work of the kind that remains. The Lazarus, in the picture destined for the cathedral at Narbonne, rejects the claim of every other hand. The Leda, the cartoon of which, formerly in the palace of the Vecchiotti at Florence, was painted in distemper (a tempera); all small or large oil pictures shown as his are copies from his designs or cartoons, by Marcello Venusti, Giacompo da Pontormo, Battista Franco and Sebastian of Venice.

J. P. De Louthembourg, R.A.

There was a period, when Louthembourg was apparently bewitched from himself, when the phantasies of an unsettled mind drove him upon the trial of experiments equally futile and unprofitable; when the *auri sacra fames* made him immure himself from the world to seek the philosopher's stone, he pondered, he floundered, and was approaching fast to the threshold of common pity, cadaverous, but not rich, when the good sense of a relative saved him from local perdition; she burst upon him during his nocturnal studies when he was keenly watching the deceiving process of transmutation in company with a charlatan from the Lower Rhine; the reddening fair caught them in the raging of the enchantment, when they were calcining Venus with the butter of the daughter of Luna, and fixing Luna herself into Sol. She broke his crucible to shivers, enfranchised the simmering metal, extinguished his fires, and seizing the forceps took his adult associate by the nose and led him from the laboratory into the street, where the enraged lady broke his head with a pipkin and then dismissed him with a timely malediction. From this eccentricity he shortly wandered to another, originating from a wild benevolence of spirit; this inventive gentleman dreamed that he was blessed with a knowledge of the Panacea Catholicon, or remedy for all diseases; he professed to be an adept in the art of healing and was believed; his gates were crowded with the diseased of all degrees, and he imagined he could eradicate their complicated maladies by the secret springs of sympathy; he ardently thought himself "eyes to the blind and feet to the lame"; he enforced his spells, but the end was not answerable to his hopes, the cripple was unrelieved and the internally afflicted were not grateful for his attention. The miserable inmates of the vicinity rushed liked a common torrent from Putney, Brentford, Kew and No-Man's land; the blind followed the whoopings of the lame until they congregated on the terrace at Hammersmith; here they manifested their wrath by a yell that would have staggered Cerberus; the Alsatian Celsus heard the curse with dread; he seized his telescope and scudded to the garret to reconnoitre, the liberal chemist leered upon the disappointed mob from the parapet of his mansion and saw his most valued medicaments cast into a fetid ditch; his *agua beoartica*, his *catharticum argentum*, his *calomelanus* and his dear *pilula panchymagoga* were hurled amid the swine of the district, while he, like another Jeremiah, stunned even Heaven with his lamentations as his big manly tears ran down the gutter to the silver Thames.

GENERAL HOSPITAL, BIRMINGHAM.

OUR attention having been called to an error in our description of the work at the General Hospital, Birmingham, we sent down a member of our staff to make inquiries, and we learn that the whole of the faience and tilework, which has given great satisfaction, has been carried out by the Leeds Art Pottery Company, with the exception of the waiting-hall, which has been lined with Staffordshire faience, supplied by Mr. Whitehead. The work supplied by the Leeds Art Pottery Company is as follows:—The staircases, five in number, eighteen arches, in front of the general offices and main corridors, the tower, lobbies, thirty-six bathrooms, the extensive range of departments which comprise the kitchens and the skirtings, which measure $3\frac{3}{4}$ miles, also the skirting and bathrooms in the nurses' home.

In an early issue we shall illustrate one of the tower lobbies showing also part of the staircase, which will give our readers some idea of the extent and artistic treatment of the work executed by the Leeds Art Pottery and Tile Company.

Lift Accident at the General Post Office.

SIR,—As it is well known that we have supplied a number of lifts to the General Post Office, we think it only fair to ourselves to state that the lift which was the cause of the recent lamentable accident was not one of our manufacture.—We are, sir, your obedient servants,

EASTON, ANDERSON & GOOLDEN, LIMITED.

GENERAL.

Sir Isaac Newton's house in St. Martin's Street, Leicester Square, is to be taken down shortly.

The New Hotel which is to be erected at Sheringham, and for which a provisional license is granted, is to cost 30,000*l*. There will be 100 bedrooms.

The London County Council adopted the following resolution on Tuesday last:—"That the Parliamentary committee be instructed to take the necessary steps to insert a clause in one of the Council's Bills empowering the Council to purchase or contribute towards the cost of purchasing or otherwise incur expenditure in connection with the preservation of buildings and places of historic or architectural interest." Mr. Benn seconded the resolution, which was adopted.

M. Roty, the engraver of medals and of coins, is about to present the French Mint with a collection of his designs which were prepared during several years.

A Return prepared by the Chamber of Commerce in Leipsic shows that during the past year 1,337 volumes on the fine arts were published in Germany. The volumes on engineering sciences number 595. The total production of new books was 23,339 volumes.

Hornchurch Marsh, near Barking, containing about 130 acres, is recommended for purchase by the streets committee of the Corporation as a depôt for dust and refuse of the City. The value is 25,447*l*.

The Town Hall of Helsingborg has been completed at a cost of about 40,000*l*.

The Priory Church of St. Bartholomew the Great, West Smithfield, may now be said to be restored, but further portions of the original building are still being found. During the last fortnight some 20 feet of the exterior wall of the north side of the lady chapel have been uncovered. This wall will now be left permanently exposed. The building, and especially the lady chapel, which was opened last May, continues to attract large numbers of visitors, and during October the whole church, including the crypt, will be thrown open, free of any charge, on two Saturday afternoons, viz. October 9 and 16, and the points of interest will be explained by one of the hon. secretaries of the Restoration Fund at half-past two precisely. A collection will be made after the lecture towards defraying the debt still owing on the recent works.

At a General Assembly of the Royal Society of British Artists the following gentlemen were elected members:—Messrs. A. D. McCormick, Harry G. Shields, R. Goodman, Percy Craft, James Greig, R. Ponsonby Staples, Ivystan Heatherington and W. G. Knight.

The Duke of Westminster has, it is said, purchased three pictures in the collection of Jonkheer Six of Amsterdam—a Rembrandt, a Cuyp, and another old Dutch masterpiece—for nearly a million florins, in order to present them to the Queen.

Mr. John Cash is the architect for the new premises erected for Macmillan & Co., publishers, in St. Martin's Street, W.C.

Mr. A. Sanderson has presented to the Chiswick Urban District Council a valuable property known as No. 1 Duke's Avenue, for the purpose of a free public library.

The Opening of the West Riding County Council's new offices in Wakefield, which were expected to be ready by December 1, has, on account of the incomplete state of the building, been postponed till February 23 next.

The New Public Halls just erected at Uddingston were opened last week. The building is situated near the Caledonian Station and comprises large hall to seat 1,000 and lesser hall to accommodate about 250. Besides, there are two large cloak-rooms for ladies and gentlemen and two committee-rooms. Under the stage there are dressing-rooms and kitchen and on the stage level a green-room. The total cost has been 3,500*l*.

The Architect.

THE WEEK.

A NEW street in the City hardly seems a possibility, but the London County Council on Tuesday approved of an application from Messrs. DAVIS & EMMANUEL to form one leading out of Noble Street. It is to be only 13 feet wide, and is intended for foot traffic. It is to be called Fitchett's Court. The conditions imposed by the Council are as follows:—(a) That the name of the street as approved by the Council be affixed on posts at the end of such street until the houses are built, when the name must be affixed according to law; and (b) that if the said application, plan, or particulars be hereafter found to be inaccurate in any respect, the said order shall be null and void. That notice of such order be given to the applicants with an intimation that the Council's reasons for the imposition of such conditions are:—(a) That it is expedient in the public interest that immediately the formation of any street is commenced its name should be affixed as required by the order; and (b) that there should be no deviation from the scheme sanctioned by the Council. At the same meeting the plans of the proposed theatres at Peckham, Walham Green, Brixton and Charing Cross Road were approved, while the plans for the alterations at Olympia were considered unsatisfactory.

ON Tuesday the question of who is to design the new lunatic asylum at Rubery came before the Birmingham City Council. The committee had agreed to appoint Messrs. MARTIN & CHAMBERLAIN. One of the reasons for the selection was that several competitions in Birmingham and the vicinity could not be considered satisfactory, as economy and efficiency were not secured. Then it was said that the majority of the local architects were without experience in the erection of asylums, and to arrange an open or unrestricted competition might result in the success of a stranger, which would not be satisfactory. In such a case Messrs. MARTIN & CHAMBERLAIN, who had been engaged on asylums, would be excluded, for they declined to compete for any building unless they were paid for their trouble. To pay fees to all competitors would lead to an expenditure of about 2,000*l*. The building required was to be plain, and the committee could not perceive any advantage which would arise from making it the subject of a competition. The majority of the Council disagreed with the asylums committee. The voting will be approved by architects in Birmingham and elsewhere. If there is only one firm of architects who are acquainted with the arrangements of asylums it would be wise to have the number increased, for the demand for asylums is becoming more urgent. If the buildings are as simple as the committee describe them, an architect who has had experience in other work could without difficulty become acquainted with all the necessary details. There are, unfortunately, buildings enough in England where he could study. We have not a word to say against the firm who were nominated, but it deserves to be remembered that for several years they enjoyed a monopoly of municipal work. When the standing order was made which was supposed to make competition henceforth obligatory, the intention was to put an end to favouritism that was considered to have many disadvantages.

IN the address which Mr. R. W. FOWLER delivered as president of the Sheffield Society of Architects and Surveyors on Tuesday, he referred to the action of the Corporation in restricting a competition for a fire-brigade station to the members of the Society. He pointed out the advantage accruing to the Corporation from the arrangement, instead of employing an architectural staff of their own, whose services could not always be in requisition, and who yet must necessarily be a permanent expense. They thus obtained the talents of practically the whole architectural profession in the neighbourhood, with very beneficial results not only to themselves, but to the ratepayers at large. The tendency of corporations nowadays was, he said, to concentrate the work of a town in the hands of their

own body, and employ their own workmen to carry it out. That was not economical, they all knew, and whether it resulted in greater efficiency was a matter of controversy. The evil growing out of it, which hardly seemed to obtain the attention it deserved, was the difficulty of dispensing with the services of an army of men, or a portion of them, with the necessary increased staff of permanent officials, when not required, and the consequent obligation that arises to find employment for them at the unnecessary expense of the ratepayers. When the trade of a town was prosperous the burden of increasing rates was not heavily felt; but when the tide turned, and economy became necessary, a social difficulty would be likely to arise which he was afraid was not duly considered by the advocates of this system. No large employer of labour would dream of carrying on his work on the principles that are urged as so necessary for some corporations. A railway company, he remarked, when making new lines invariably employed contractors, and on the high efficiency of that work depended the safety of hundred and thousands of lives in the future, and why a municipality should be unable to supervise piece work with the same satisfactory result as private individuals and other corporate bodies was a matter difficult of comprehension. The remarks of Mr. FOWLER should receive consideration from municipal councils that possess architectural departments.

AN action between a district surveyor and the London School Board on a question of fees will have some piquancy for ratepayers, especially as the London County Council will, no doubt, support their officer, and consequently whoever wins the costs will fall on the Metropolis. In April last Mr. BERNARD DICKSEE applied to Mr. GOAD, one of the School Board contractors, for 9*l*. 7*s*. 6*d*. fees. The Board put the case in the hands of their solicitor. It was said that although the work done was on the site of an old school in Rockingham Street, Newington, the district surveyor had based his fees on the scale of the new Building Act of 1894, which are in excess of those allowed under the Act of 1855. As the school was erected in 1855, the works committee are of opinion that the Act of 1855 applies, and that the Board could successfully resist the claim for the larger amount. A summons has been served upon Mr. GOAD for the amount of the fees, which the solicitor to the Board has been instructed to defend.

THE Dominicans may no longer have famous painters enrolled in their ranks, but they have not ceased to take an interest in art. The remarkable figure of CHRIST which M. JAMES TISSOT has completed in their chapel in the Faubourg Saint-Honoré, Paris, and which was unveiled on Sunday last, is evidence of the importance they still attach to wall-painting. This figure is colossal, for it occupies the whole of the space behind the altar. CHRIST is represented with the arms outstretched. The space from hand to hand is fifteen metres. Above the wall is a cupola, in which it was necessary to introduce the head, in order that the figure might be as large as possible; but the combination of plane and curved surfaces was regarded with doubt. M. TISSOT has contrived to obviate the difficulty presented by the concave surface by packing it with layers of canvas in such a way that the addition is not noticeable. The head, which measures two metres, and is surrounded by a nimbus of golden rays, accordingly stands out from the azure ground most effectually. CHRIST is clad in white robes. The figure is seen above a balustrade, and in the bays floral symbols of the Virtues are introduced.

M. GODEBSKI is a Polish sculptor who has been brought up in Paris. He was taught his art in the Atelier Joffroy, and among the works he produced is the monument of THÉOPHILE GAUTIER in the Montmartre Cemetery. The Franco-Russian alliance has served M. GODEBSKI. The CZAR has given permission for the erection of a memorial of the national poet MICKIEWICZ in one of the public places of Warsaw. The Poles at once subscribed 700,000 francs for its execution, and M. GODEBSKI is the fortunate artist to whom the commission for so important a work is entrusted. The poet died in 1855, and the liberty to place his portrait before the eyes of his countrymen is accepted as a most generous concession.

RENAISSANCE ARCHITECTURE IN ENGLAND.*

IN his opening lecture at University College, Professor ROGER SMITH pointed out to his students that "to all appearance the reasonable probability is that those who are beginning to study architecture now with a view to practise it as a profession, will find that if they are to follow the current of public opinion in their day, it will be some form of Renaissance art that they will pursue," and accordingly it was wise for them to direct attention to Renaissance from the first. It needs no gift of prophecy to arrive at that conclusion. Whether owing to the desire for change which is implanted in men, or the inconveniences which the occupants of Gothic buildings have to endure, or some other cause, the whirligig of time has again brought direct or indirect imitations of Italian buildings into fashion. It would perhaps be safer to say that the style is preferred for secular buildings, inasmuch as Gothic churches continue to have their admirers. There is no reason why the two styles should not be favoured, especially as each has advantages. Gothic may be under a cloud, but it has more numerous associations with English life than its rival.

The time is therefore opportune for the appearance of so excellent a history as Mr. REGINALD BLOMFIELD has prepared. A comparison of its merits with others of its class is impossible. Incredible as it may appear, there was no satisfactory work on the subject available for the use of students of architecture or laymen. There were books on some of the architects who made the history, and on the buildings which exemplify the style, and there are few subjects in the two volumes which were not already treated in papers read before societies or in technical journals. But in all such attempts proportion is apt to be overlooked. The relation of parts to the whole period is not considered. The nearest approach in a history was in Mr. GOTCH's work, but it could only be partial in its aims, for they were mainly determined by the buildings selected for illustration. As far as we know, Mr. BLOMFIELD is the first who has endeavoured to present a continuous history of English Renaissance, one which explains the forces which were in operation and affected the design of the buildings, and one which enables the reader to appreciate the relative importance of the examples which were produced between A.D. 1500 and 1800.

That the books which Mr. BLOMFIELD has utilised are numerous will be evident from the list prefixed to his first volume. He has also referred to the invaluable abstracts of State Papers and has had recourse to college and other collections of documents. But he has found, like older explorers, that chroniclers in general bestowed little attention on the arts in England, and the writers in the early newspapers and periodicals found subjects more attractive in the gossip of the time. STEELE, with characteristic generosity, stood up in defence of WREN, but there was no scribe who cared to note the progress of WREN's masterpiece.

MACAULAY's "History of England" was described as a huge pamphlet in support of Whiggism, and every history, unless it is of the "old almanack" species, must have an ism of some kind to uphold or cast down. What is the ism of Mr. BLOMFIELD's history? It would probably be best suggested by "patriotism," if that word was not of late degraded. Unless we are mistaken, his proposition is that English Renaissance was as much of a reality as any of our English institutions, for the foreign elements in it were subdued or transformed by the national spirit. This is suggested by the opening paragraph of the first chapter:—

For the purposes of this history the Renaissance in England will be taken to mean that fresh departure in architecture which began with the tentative efforts of imported workmen in the reign of Henry VIII., which reached its highest development in the hands of Inigo Jones and Wren, and eventually ran itself out in the uncertainties induced by the literary eclecticism of the end of the eighteenth century. The remarkable expansion of the English people in the sixteenth and seventeenth centuries, and the strong conservative instinct of the race, constitute the two contending influences which struggled for the mastery in this new movement, and finally united to give it a distinctly national character. The two factors to be considered are, on the one hand, the constant

importation of foreign ideas, and on the other, the tenacious tradition of a people with a great historic past in architecture. From first to last the process of fusion and adjustment between these two elements occupied over 100 years, and it was the work of the greatest architect this country has possessed, perhaps our one architect of quite commanding genius, to gather up the broken threads and weave them together into one splendid and harmonious architecture.

It is always an advantage in a book when forces can be represented in opposition, and it is a peculiarity of the Renaissance in England to be able to show a continual struggle for survival. In no other country in Europe did so many foreign artists gain a footing. Italians found their way to Germany and France and a few Frenchmen and Germans were received in return; Flemings settled in France. But if we compare the numbers of strangers who are recorded as emigrating from one part of the Continent to another with those who were not deterred by the Channel from appearing in this country, the difference is enormous. WALPOLE and VERTUE's pages record the names of many of the strangers. Among those connected with architecture in various ways and mentioned in Mr. BLOMFIELD's history were JOANNES DE MAJANO, TORRIGIANO, ROVEZZANO, A. CAVALLARI, A. TOTO, the BERNARDIS. They were among the pioneers who introduced the new forms. But Mr. BLOMFIELD maintains that, in spite of the number of Italians in England and the patronage they secured from HENRY VIII., "we cannot point to a single instance of a building of the sixteenth century designed and carried through by any one Italian in England; the evidence on every hand points to the conclusion that they were employed as workmen, and in no sense as architects." The region in which they were employed was restricted mainly to the southern counties. But the power and indirect influence of the Italians is recognised by Mr. BLOMFIELD, for, as he says, "The mere fact that men of the ability of TORRIGIANO, ROVEZZANO and MAJANO were working in England for several years must have had its effect on the native workmen among whom they worked, and families of Italian artists, such as the BERNARDIS at Chichester, must have done something to familiarise these workmen with Italian detail and its very high standard of workmanship."

The Germans had next a turn. HOLBEIN was prized for the naturalness of his portraits and his extraordinary versatility as a designer. His influence has not yet died out among us. HOLBEIN's architectural work, however, appears to have been confined to a couple of gateways, although he may have prepared drawings of many building projects. It is sometimes difficult to distinguish between Germans and Flemings. HENRY DE PAS was the designer of GRESHAM's first Exchange in London. The Germans were busy with mantels and chimneypieces, but the fantastic forms they carved were less injurious than the pattern-books they introduced. Then, as now, there was a weakness for "bits" which could be cribbed. Such obscure persons as CAMMERMAYER and WENDEL DIETTERLIN, says Mr. BLOMFIELD, were preferred to ALBERTI and PALLADIO, and "the various superb Italian editions of 'Vitruvius' seem hardly to have been known in England till the time of the sixteenth century. It is evident, in fact, that the English builder-architect of the time of ELIZABETH was a somewhat ignorant and ill-educated person, and did not follow better models for the simple reason that he was unconscious of their existence." German ornament was made up of a number of independent parts, and would be easier copied than an Italian design, in which there was only one subject. The number of straight lines was also an advantage. Hence it was, as Mr. BLOMFIELD tells us, that "for one piece of ornament that can be traced to an Italian motive there are twenty that are clearly due to German influence in Elizabethan and Early Jacobean buildings. That this influence, however, had not sunk very deeply into the minds of the English is evident from the ease with which INIGO JONES threw it overboard, and it did not reappear in England so long as the development of architecture was spontaneous and traditional, and though not unconscious was not the result of deliberate eclecticism."

If we assume that foreigners were mainly occupied with decoration, the question then arises, Who were the English architects and builders to whom we are indebted for so many buildings which have survived to our times, as well as

* *A History of Renaissance Architecture in England, 1500-1800.* By Reginald Blomfield, M.A., architect. Two volumes. George Bell & Sons.

others which were renowned? With all his endeavours Mr. BLOMFIELD is unable to resuscitate the names of many of them. What is more, he is not afraid to diminish the number by treating JOHN THORPE as an almost mythic personage. Mr. BLOMFIELD does not believe that the drawings in the Soane Museum are all THORPE'S buildings. He credits him with no more than a few, and there are good reasons for the contention. THORPE is considered by Mr. BLOMFIELD to have been "a fair instance of the class of men who worked in England during the transition stage from the builder-designer of Mediæval days to the academic architect of the following century." The SMITHSONS are described as over ambitious. HOLT is credited with several buildings in Oxford, but Mr. BLOMFIELD doubts whether he was more than a contractor for woodwork. JOHN ABEL had some reputation in his day for half-timber houses, which, we are told, "in their rude vigour of design and coarseness of erection closely resemble the half-timber work of Lancashire and Cheshire in the north and of Somerset and Devon in the south."

Excellent work was executed by builders who had no more aspirations towards fame than if they employed their labours in the fields. They merit the praise which Mr. BLOMFIELD bestows on them. There were many contracts going in the sixteenth century, for country gentlemen were then eager to possess more commodious houses. The chapter on sixteenth-century house-planning is one of the most interesting in the book. But the period was like so many others, one of transition. Mr. BLOMFIELD says:—

The architecture of the hundred years from 1520 to 1620 was in fact tentative. The builders were losing their old tradition and had not yet replaced it by a new one, and, on the other hand, a certain sense of expansion and intellectual enfranchisement in the air at the time tempted them to bold experiments, for which they were ill-equipped. So long as they adhered to plain building their work was admirable, but directly they attempted what they probably considered to be serious art they were on uncertain ground, and the result might be an elaborate and costly building, but it was seldom architecture. The specialisation of building had already begun: the builder instead of being an artist, who built and designed in one and the same process, was already becoming a person who built buildings, and then thought it necessary to adorn them with ornamentation borrowed at random. The conclusion is borne out not only by the buildings themselves, but by the rapid increase in architectural treatises and pattern-books, a sure sign of the increased demand for novelty and of the recognised inability of the builder to meet it. Soon after the middle of the sixteenth century, a vague consciousness of the Orders, as some terrible mystery at the root of all architecture, had begun to present itself to the mind of the English builder-designer. It is, indeed, at once comic and pathetic to think of some good mason who could build a building well, but sign his name with difficulty, wrestling laboriously with all the intricate terminology involved in the system of the five Orders as elaborated by scholarly Italians.

The arrival of INIGO JONES in England was the cause of a transformation, in spirit as in forms. Mr. BLOMFIELD tells us how "the homely fancy, the lovable humility, as one might say, of the traditionally art were laid aside; the art of this country was to be no longer an affair of happy instinct, but completely conscious, dependent on scholarship almost as much as on capacity in design. Henceforward, abstract thought and imagination, under rigid restraint, were to supersede the poetry of Mediæval fancy." Apparently INIGO was unlike the men who were accepted as artists in England. BEN JONSON, who as a bricklayer may have distrusted innovations in building, called him a butterfly, a fop, and gibes his "pedling poetry," for on occasion JONES attempted verse-making. It was also suggested that his buildings were only reproductions of his scenery.

O wise surveyor, wiser architect,
But wisest Inigo, who can reflect
On the new priming of thy old sign-posts,
Reviving with fresh colours the pale ghosts
Of thy dead standards; or with marvel, see
Thy twice-conceived, thrice-paid-for imagery,
And not fall down before it, and confess
Almighty Architecture, who no less
A goddess is than painted cloth, deal board,
Vermilion, lake or crimson can afford
Expression for.

It was fortunate; however, that JONES'S patrons were

not afraid of being taunted with possessing theatrical buildings, and there can be no doubt he was served by his connection with the Court. Although he was fined heavily, he was able to practise under the Commonwealth. Mr. BLOMFIELD ascribes to JONES the merit of having "freed English architecture from the imbecilities of the English designers, and started it on a line of fresh development, borrowed, it is true, from Italy, yet so successfully adapted to English traditions that it was at once accepted and followed by the best intelligence of the country for the next hundred and fifty years." To have emancipated architecture is a distinction which few artists can claim, and it is enough to insure INIGO JONES'S reputation.

The chapter on seventeenth century Gothic is curious, but the time was not ripe for a revival of Mediævalism. Where WREN failed it was not likely that men with weaker powers of observation could succeed. That WREN was unable to perceive the characteristics of a Gothic building and yet could appreciate Renaissance forms is one of those psychological puzzles which can never be explained. Mr. BLOMFIELD does not attempt to represent the architect as a heaven-sent, infallible genius. He demonstrates how WREN improved by practice, and insists that the existing St. Paul's is superior to any of the projects which appear in WREN'S drawings. The reproductions of some of the original designs support his argument. But Mr. BLOMFIELD claims that WREN'S later work was "eminently English in its sober power," and that he was the true successor of INIGO JONES "in all that makes architecture vital, in all the qualities that gave to the English Renaissance its sterling masculine character."

The names which appear in the second volume have not the interest which belongs to JONES and WREN, although among them are VANBRUGH, GIBBS, WARE, PAINE, CHAMBERS, GANDON and the ADAMS. Excellent work was produced, but there is less difficulty in following precedents than in establishing them. The amateur continued to be respected. It was open to anyone who could design and have a design realised to pose as an architect. HENRY BELL, whose name is associated with the Custom House, King's Lynn, was an engraver. ALDRICH was an Oxford dean. BURROUGH was master of a college in Cambridge. The explanation offered by Mr. BLOMFIELD is that "when a correct use of the Orders according to the recognised canons was the test of architecture, and the question of cost was seldom raised, the amateur very soon stepped to the front and began to furnish designs of his own—or, at any rate, to give instructions to draughtsmen, who were content to leave to the amateur the credit of the design." But an art which is supposed to be easily attained is not generally appreciated, and if amateurism helped architecture at one time it aided in its decline in the eighteenth century. Lord BURLINGTON as the Apollo of art might find "a proper priest in the person of Mr. KENT," but there were also gods and priests who did not appear to possess celestial qualities, and co-operated in designs which were not inspired from Olympia. Mr. BLOMFIELD analyses their works with care and without any of that sense of superiority which is usually found in modern criticisms on the buildings of a period which is not in favour. Nor does he set up works as models for the sake of running against common opinion. It might easily be supposed the historian considers that under similar conditions he also might have lapsed into errors against good taste and good sense.

A writer on the English language who supposed that men like Sir THOMAS BROWNE, JOHNSON, GIBBON and other rhetoricians expressed it most faithfully would be held to be altogether wrong. The vernacular was not for them. In the same way there is a homely as well as a stately architecture. Mr. BLOMFIELD has a leaning towards the former. He is never more happy than in his descriptions of houses which appear to have been erected without any striving after impressiveness, and somehow are striking by their beauty. An architect is bound to respect conventional ornament, and more especially when treating of Renaissance work, but Mr. BLOMFIELD expresses admiration for "the stonemason at Dorchester who was cutting on the tombstones the mallows and forget-me-nots of the meadows round his home," while ARTARI and BAGUTTI were modelling conventionalities for JAMES GIBBS. Unless we are mistaken the chapters on "The Trades" contain to a great

extent Mr. BLOMFIELD'S theory of architecture, and they bring the book to a suitable conclusion.

Nowadays students of architecture appear to consider that intuitively a knowledge of the history of architecture can come to them. They will, however, find it profitable to study Mr. BLOMFIELD'S two volumes with all the earnestness they can command. The subject is made more interesting than it commonly appears in technical treatises, and it has, moreover, the recommendation of expressing the author's own thoughts. The illustrations, which are abundant, consist of reproductions of Mr. BLOMFIELD'S sketches, of old drawings and engravings, and of photographs. The last are not the most successful. In his sketches the author generally avoids subjects that have become familiar. An architect will find it difficult sometimes to avoid feeling remorse when he observes interesting buildings and details derived from places which he has visited, but the whole wealth of which he overlooked. If there are any followers of Gothic who still hold English Renaissance to be pestilential, Mr. BLOMFIELD'S work will convince them to the contrary, while admirers of the style should be glad to have a demonstration of the national qualities which English Renaissance exhibits.

ELECTRIC TRAMWAYS.

By F. J. WARDEN-STEVENS, A.M.I.E.E.

(Continued from page 214.)

The Overhead Trolley System.

THIS is the most used of any of the various systems, and is on the whole most satisfactory at the present time. The Dublin tramways is one of the most instructive examples of overhead traction in this country. The opposition to the use of overhead wires was very violent, and the Corporation would not submit to their use until visits had been made to continental towns and a report on the subject had been submitted by a consulting engineer. The result was that the Dublin Tramways Company were allowed to equip their lines with the overhead trolley, and the work was completed in 1896. This line, which is seven and three-quarter miles in length, extends from the corner of Haddington Road, in Northumberland Avenue, Dublin, to Dalkey, *via* Kingstown, there being a short branch down to Kingstown Harbour.

The generating station is at the Dublin end of the line, the object being, no doubt, to facilitate the extension of the system to other lines, the station thus being fairly central. As the furthest point is some $7\frac{1}{2}$ miles from the generating station, the ordinary 500 volts continuous current was not suitable for transmitting the energy such a long distance; a high-tension system was therefore devised. The generating plant consists of three 250 horse-power Babcock boilers, working at 120 lbs. per square inch, fitted with mechanical stokers, the feed pumps being electrically driven. There are four 150 brake horse-power engines of the Willans type driving the dynamos by means of belts. The dynamos consist of two 100 kilowatt four-pole 500 volt tramway generators, which are further designed to increase their voltage to 550 volts at full load to overcome the extra line losses.

These generators are connected to the line at the Dublin end, while there are two six-pole 120 kilowatt three-phase generators, wound for 2,300 volts to 2,500 volts. The continuous current machines run at 625 revolutions and the alternating machines at 600 revolutions per minute. The three-phase alternators feed the further end of the lines by means of rotary transformers, which convert the high-tension alternating currents into 500-volt continuous currents. These motor transformers are placed in two sub-stations, one at Blackrock and the other at Dalkey. The Blackrock sub-station contains two direct coupled sets, each consisting of a synchronous three phase motor coupled to a 60 kilowatt (80 electrical horse-power) direct current generator, the pressure being from 500 to 550 volts, and there is a switchboard for controlling the motor generators. The Dalkey sub-station is similar, except that the machines are smaller, being of 50 kilowatt each.

In the Dublin example the line is divided into half-mile sections, the sections being connected together and to the feeders from the generators in switch pillars along the road, and also there is in each pillar a lightning arrester.

A lightning arrester is necessary in every case where there are uninsulated overhead wires. It is a device for providing an easy path to earth for the lightning, while allowing no permanent connection to earth. There are various devices for effecting this, but they all consist of an extremely short spark gap, over which the discharge passes in preference to travelling along a line which has some self-induction. The type used at Dublin is the "Ajax," which consists of two brass wires insulated with silk and placed side by side, both being sealed into a glass tube. One wire is connected to the line and the other to the earth plate, and the lightning discharge sparks between the two parallel wires, probably fuses them together, but the wires are immediately fused by the earth current. There are several of these fuses, which come into operation successively, so that the pressure can be discharged many times before the line is left without any protection.

The feeders and also the high-tension mains are laid in a special trench, usually under the pathway. The trolley wires are throughout nearly the whole route suspended from span wires supported by poles on either side of the road. This method of construction is no doubt more objectionable than the centre pole with double bracket arms, but it does not affect the appearance of the roads very much, especially when the side poles are hidden by trees. The poles are tubular and of steel, being in three sections and having overlapping joints shrunk together while hot. The tube has a cast-iron base, and is set 6 feet into the ground. The span wires are of mild steel cable $\frac{3}{8}$ inch in diameter, and they are insulated from the poles. The trolley wires are slung from these wires by means of insulators. The type of insulator used in this case is that known as the "West End." This consists of an insulator into which is fixed firmly an iron double grip for the span wire, and from which hangs a grip for the trolley wire. This grip is arranged so that the wire is not increased in size to any great extent, and does not therefore impede the trolley. The trolley wires are of hard drawn copper, $\frac{1}{32}$ inch in diameter. A trolley wire is suspended over every turn-out and cross-over, and also over the tracks in the car sheds. At turn-outs the branch-line conductor is not usually connected to the main, but there is a small gap; when the trolley comes to this gap it is pulled down by means of a cord and swung over from the main to the branch conductor.

The trolley itself calls for little attention. It is mounted on a cast-iron pedestal bolted to a plank running the whole length of the roof. The height of this pedestal is 6 feet 6 inches, sufficient to keep the arm from touching any passenger. Fixed to this pedestal is an inclined arm pivoted, on the far end of which is the trolley wheel which runs on the wire, and which is pressed up to the underside of the wire by means of two helical springs, fixed to the pedestal and to the arm on the opposite end, *i.e.* the near side of the pivot.

There are several trailer cars used on the Dublin line at times of heavy traffic, which may also be used with the horse traction. The rails are connected together for the return circuit by the "Chicago" bond in this case. This rail bond consists of a copper rod or wire having tubular or thimble-shaped terminals, which are bent at right-angles to the bond and, with its two tubular terminals, is composed of one solid piece of rolled copper. The tubular or thimble-shaped terminals are inserted into holes through the web of the rail, and the end of the terminal (which has slits in it) is spread or rivetted over the other side of the rail web with a hammer and punch. This prevents its being withdrawn while a drift pin, which is larger than the hole in the terminal, is driven in. This pin expands the copper and makes a solid contact between the bond and the rail, making an absolutely solid joint from which every particle of air and moisture is excluded, and which therefore will not corrode.

It may be of interest to mention the construction at curves. The number of span-wires have to be increased very much to keep the trolley-wire in an approximately correct position, and frequently there must be a single side

straining-wire. These span and straining-wires cause great disfigurement to a street, and this is admitted by almost everyone.

The Third Rail System.—A description of the Bessbrook Electric Tramway may be of interest in this connection. This tramway partakes somewhat of the nature of a light railway, as it is enclosed for the greater part of its length. The line is three miles long, and runs from Bessbrook to Newry; it is used for goods traffic as well as for passengers. The tramway was designed for carrying 200 tons of goods per day in addition to passengers. The generators consist of two 18 kilowatt 250 volt machines, driven by water-power. The track has a gauge of 3 feet, and the average gradient is 1 in 86, the maximum being 1 in 50. A very ingenious arrangement has been adopted with the goods waggons, which must be capable of running on the ordinary roads as well as on the tramway. The method adopted is to have second inner rails laid an inch higher than the outer rails. The conductor consists of an inverted channel steel conductor, supported in the centre of the track on glass insulators. A large surface is thus obtained for contact and a mechanically strong rail. These steel conductors are jointed with fish-plates, with a soft copper cushion between the conductor and fish-plate.

Level crossings are met with in several places, and it becomes necessary to discontinue the conductor. The electrical continuity is maintained by an underground cable; and, as the car has two collectors, one in front and one behind, contact is made by the foremost collector before the hinder one breaks it. In one place the gap is too wide for this, so an overhead wire had to be erected, and a cross-bar collector fixed on the top of the car; and, as the steel conductor and the overhead wire, as it were, overlap, the continuity is maintained.

There is nothing calling for special notice in the motors or other details. This line carries about 17,000 tons of goods and 100,000 passengers, and 21,000 tram miles are run per annum. As a light railway it is an example of what can be done with electricity, as it is a financial success.

(To be continued.)

DESIGN IN LETTERING.*

(Continued from last week.)

IT is of no use trying to evolve new alphabets out of our inner consciousness. No one would understand us; and we want to be read. Originality is perhaps never the thing to seek: it comes; we are original or we are not; but least of all is it to be sought in lettering.

While the alphabet is alive there will be changes in it; but they must inevitably be gradual; we can only creep on to new forms. Practically, all that is left for us to do is to take one or other accepted type of alphabet and make in it such modifications as we may deem desirable, being careful that they do not too much interfere with its legibility.

The more general opinion is, I know, that nothing should interfere with its legibility at all. I quite appreciate that point of view, and yet I maintain the right of art to interfere with its legibility on occasion—and on occasion to interfere with it considerably.

It all depends upon the occasion. There are times when wording is introduced into design with the deliberate purpose of hiding it more or less, just as speech may be said to mystify. And just as in speech it is more to the purpose to suggest than to demonstrate, so in lettering there are times when a hint is more to the purpose than an advertisement. True, advertisement is the order of the day, and in advertisement there is no such thing as modesty, but there still are occasions when the almost obsolete thing called reticence is more becoming. If, for example, on a wedding gift (the modern equivalent of a marriage *cassone*), I choose to indicate in wording the occasion of the gift, there is no need so to shape the words that he who runs may read—they are not addressed to him—it is enough that they are there, decipherable to whom it may concern.

More than that, it would be an offence if they were too plainly readable. The more tender the sentiment conveyed in the words, the more inevitable it is that they should be expressed in something like a whisper. Here, then, I say, a certain mystery about the lettering is essential. Even where that is not quite so, it may still be permissible. If one were introducing the Lord's Prayer into church decoration, the first two words, "Our Father," would so infallibly put the Christian reader on the track of the inscription, that there could be no

possible difficulty in following even the most intricate lettering.

I do not know what liberty the Arabs took with the name of Allah, which they introduced so liberally into decoration, but they could hardly take too much. There seems a sort of reverence in veiling the characters employed. So with the inscriptions borne by angels and other holy personages in Mediæval design—the Mediæval pictures were not posters, though we try to make posters Mediæval. There was no fear that anyone would misinterpret the words on the scroll ingeniously decorating the background to a representation of the Annunciation—one reads them by anticipation—and the artist was free to make all and every decorative use of them.

There are occasions, then, when lettering offers considerable scope for art, and where something may well be sacrificed, nay, should be sacrificed, to considerations purely decorative. For the most part, however, all that the artist can do is to take, as I said, some accepted type of lettering (he needs to choose it with judgment) and better it, but without in the least making it less legible. If he knows what he is about he may possibly make it more legible. And it is because I thought it would be helpful to him in this to be reminded of the descent of lettering and the phases it has gone through on its way to what it is that I have ventured to discuss the subject at what may have seemed to you some length.

His type of letter once selected, what can a man do with it?

He can take liberties with its proportion—make it taller or more squat;

He can compress it or spread it out; **

He can incline it;

He can draw it in thick lines or in thin, or in lines of intermediate strength;

He can draw it in thick and thin and intermediate lines.

The implement employed, the chisel, graver, brush, pen, affects the form of your lettering—if you will only let it (I insisted upon that last week), but, except in the very simplest, rudest and most elementary forms of lettering you are early confronted with a difficulty, a difficulty which seems to have been felt from very early days indeed, in fact from the moment when men were no longer content with mere scratching, or with simple incised lines naturally blunt at the ends.

So soon as a man began to use the chisel he felt the need of a square cross cut to finish the lines of his letters. In the case of a broad stroke there was no need for this to extend beyond the width of the stroke itself. In the case of a narrower one it was obviously easier to make it extend beyond the stroke; then it did not matter if the carver overshot the mark a bit. Besides, one chisel would do for that. He would not want a smaller one for the end cuts.

This finishing off the broad line by a projecting cross line is technically called truncation, though literally that only means "cutting off." Slight but appreciable difference in character results from the angle at which the strokes are cut off.

In working with a pen this difficulty of finishing off the stroke occurs only in the case of very bold lettering. In smaller writing the strokes naturally take pen-shape. They start square and gradually diminish, or *vice versa*, or they thicken in the middle according to the pressure of the pen, which it is difficult to keep quite equal from end to end of the stroke.

It should be observed that the pressure is not naturally in the middle of the stroke, but at one end; you don't get the symmetrical Roman O which is chisel-bred—you get the Gothic O. That is the pen-born shape.

I say that the even sided O came of working with a chisel, not that it is easier to cut than the other, but it is as easy; there was nothing to prevent symmetry, which accordingly was sought. It is rather futile to try and get that shape with a pen; much better let the pen have its way, and its way is otherwise. You get most out of your tools by going with them—it is rather stupid to go against them.

In bolder writing, even with a pen, the necessity of truncating the thick strokes occurs. You cannot with one stroke of the pen make a thick line which begins and ends square. It wants trimming, and the easiest way to trim it is by means of a fine cross-stroke extending beyond its width, as in the letter I, which, observe, helps to preserve and to accentuate the regularity of the line of lettering, for which a writer worth the name naturally has a care. The broad stroke (we are still talking of penwork) being rather loaded with ink, this fine cross stroke would be inclined in crossing it to drag a little of the ink with it, rounding the angle to the right of the latter. The obvious way of rectifying that is to round the opposite angle also, and so we have the familiar finish I.

You can soften the angle at which the cross line joins the stroke until it disappears, and the stroke appears to be curved on either side—dilates, to use another term, at the ends. (Historically we arrive at that in Lombardic writing as early as the eighth century.)

Anticipating this dilation, the penman eventually makes strokes in which the elementary straight line altogether disappears. Further elaborating he gets the familiar in thirteenth-

* Abstract of a course of Cantor Lectures, by Mr. Lewis Foreman Day, published in the *Journal of the Society of Arts*.

century work. Devices such as forking the ends or breaking the outline are the beginning of fantastic elaboration to which there is no end.

With the use of thick and thin strokes comes another difficulty. Which shall be thick and which thin? The scribes were a long while making up their minds on that point, and they contrived some very awkward combinations. The solution we have at last come to is probably the best that could be found. I don't think we need bother ourselves much about trying to improve upon modern practice in that respect, it has been a case of the survival of the fittest.

The use of thick and thin strokes necessitates intermediate or graduated strokes; there is then no other way of treating the curved lines, which are intermediate between the two. If the thick strokes are truncated the thin lines appear to want accentuation at the ends, and so the "serif" runs all through the alphabet.

It is all-important that the letters of an alphabet should be in conformity, should be treated, that is, systematically; and that is the reason why I said that we begin by choosing a type of existing letter. There is no reason why we should not cross the breed in lettering and so improve the stock. But the thing must not look hybrid—when that occurs the artist has failed. Here, again, a man may do what he can. Effort is justified by success. We have to make our creation look as if it must be so, and could not well be otherwise.

The philistine will talk as if type were in every respect better than handwork—truer and more perfect. Truer, perhaps, it may be, in the sense of being more mathematically exact, but not necessarily so truly uniform in effect; for the unyielding letters of the type-founder come together as best they may, and if they come awkwardly he can't help it. The writer can, and I think he should.

I am quite ready to admit that many an artist who ventures to introduce lettering into his design does it ill, does it so carelessly, or is so easily satisfied with very indifferent penmanship, that one is bound to confess that of the two evils hard and fast letterpress would have been the lesser. On the other hand, I contend that an artist who has been at the pains to learn to write, can, if he aims at what the pen or brush will do, and does not enter into foolish and ineffectual rivalry with the printing press, not only do what that cannot do, but do better.

Looking at any good collection of early printed books you are astonished, each time afresh, at the beauty of the page. But if you go from that straight to a collection of fine manuscripts (the comparison is easily made in the King's Library at the British Museum) you realise that, after all, printing, even such printing as was done by the great printers, was a makeshift. It is a makeshift, I know, which we must make up our minds to put up with—and it is our business to make the best of it; merely petulant complaint is childish, but when occasion does occur by all means let us have the real thing, and don't let us be persuaded by readers of print who have lost all appetite for beautiful writing, that there is no flavour or artistic savour in it. It is not good MSS. but their bad palate which is at fault.

Having perfected machinery we are doing our best to make ourselves into machines. Until that happens (which God forbid!) man's hand is still the best—in art at all events; and were it not the best, it would still have the charm of character, that individual quality for which the public, brought up on printed type, has no relish. Print, with its mechanical smoothness and precision, has gone far to distort the modern ideal of lettering, just as photography, with its literalness, has degraded the artistic ideal generally. People are apt to resent as a sort of impertinence anything in lettering which the printing press cannot do. There is offence to them in the unfamiliar. Really the impertinence is in a makeshift thing like type usurping any kind of authority in a matter altogether beyond its jurisdiction.

It is possible, in the time I have, only to hint at what may be done in the way of modifying the shapes of letters.

I have roughly indicated on a diagram the kind of liberties it is possible to take with the construction of the letter A, but only indicated, for I have not shown the small "a" nor the later Gothic forms at all. It makes all the difference whether the two limbs of the letter are sloped at the same angle, or whether the top is crossed, or whether curved lines are used. Great also is the effect of varying the position or the angle of the bar, or of breaking its shape.

I have only just hinted the new possibilities which lie in curvature.

A group of Gothic A's, taken at random from early printed books, shows what variations can be played upon a letter of a single type. It is interesting to see the individual character of each letter there, notwithstanding the strong family likeness between them.

Gothic letters lend themselves to more variety in design than Roman—perhaps because they are not so perfect in themselves. I don't say they are not more interesting on that very account. Perfection palls, and some of the Gothic forms are

very beautiful. The Roman form is fixed—perhaps because it is Classic. Or is it that it is Classic because it is fixed? In those few Gothic ways of rendering the letter A what variety is there. And by what slight changes that variety is achieved.

I have tried in a simple alphabet of my own to give some character to the letters without doing much violence to familiar forms. The difficulty is to design an alphabet legible enough and yet not quite commonplace. It makes all the difference in the world, of course, whether you are designing an alphabet with a view to type printing, to monumental or other inscription, or use only as initials. "Design" is almost too pretentious a word to use in connection with this kind of variation upon orthodox forms. One can do very little that is new.

A more florid version of the alphabet obviously of Gothic derivation, without being deliberately based upon any "authority," may lack repose; but then it is not meant to have it. It is permitted to be playful sometimes—and even skittish.

In the alphabets so far referred to, the ornamental design is in the construction of the letters. That seems to me to be the principle to go upon. And it was followed by the best designers. But at the same time, as you will see in the group of letters next shown, the letter itself could be further decorated.

Various ways of doing that are shown there. In one case the letters are, as it were, split into ribbons in their thickest parts and ingeniously interlaced. In another the whole thickness of the letter is filled in with foliated ornament. In others again the ornament is compelled to take the shape of the letter, with more or less success.

A common device is to make the letters break out into foliage. Frequently also letters comparatively simple in design are just forked and cusped at the extremities and pierced at their thickest part, the ornament being extraneous to the letter, interlacing with it, piercing it or merely filling up the space behind it. In the shading of certain letters you see the beginning of evil. A more wicked practice still is what I may call the rustication of the alphabet. There we scent the rococo.

In an elegant interlacing alphabet from an Italian copybook of the sixteenth century the artist has first drawn his letters in outline, and then made the outlines loop and interlace, so that they occupy the thickness of the letter and at the same time break the formality of its shape. Yet not too much—everything is in that; the form of the letter is sufficiently preserved, and it is always a form worth preserving.

An ingenious elaboration of the lower case "black" letter, also from an Italian writing-book, is quite a good specimen of the "ribbon" letter. Whence once the carver or engraver began to consider the broad strokes of his letter as straps, and to suggest by ever so slight a cut that they were turned over at the ends, it was inevitable that he should arrive eventually at this kind of thing—to which the square black letter lends itself so easily. The result is florid but fanciful; one could not stand much of it at a time; but in moderation it is a distinctly pleasing excess—and it is admirably done.

Some highly ornamental letters were designed by Israel van Meckenken, late Gothic of course. The broad divisions of the letters filled with flamboyant German arabesque tell light upon a dark ground, which in many cases overflows its margins and fills the space contained within the closed letter. Elsewhere a separate spray of scroll-work fills the space. In every case it is (like the letters themselves) largely designed and vigorously drawn—as one might expect of this consummate "Little Master."

Much less interesting to me than Van Meckenken's letters are those initials, printed at Augsburg in 1483, in which the closed letters frame little pictures, quaintly conceived, but not eminently beautiful. It was a common practice to make the initial letter where it was possible enclose a picture; but it was obviously not always possible; and where it was it is doubtful if that makes the best frame. I think not. The picture frame idea is persistently carried out in an alphabet by Mathias Geron (1555). So absolutely are these regarded as frames that the pictures are cut on little separate blocks let into the larger one; you can see where the picture is cut off square. Often the letter is sacrificed to the frame. This is most felt in the letter S, in which the most emphatic part of the letter is eliminated to make room for the picture. In another alphabet of similar kind Geron has evidently felt that his initials did not speak for themselves, and has accordingly introduced a little explanatory letter so that there shall be no mistake about it. The little pictures were interchangeable. The same letter is used to frame separate pictures, and the same picture is framed by various letters.

The late Gothic letter of the more fantastic kind, penwork in excelsis, is effectively illustrated in the initials printed at Ingolstadt in 1563, which are very characteristically German. There is too much flourishing of not very carefully considered lines in them, the kind of lines which would lend themselves to braiding; but they have character, they are broadly penned, and they are not too difficult to read.

On the other hand, the identity of the smaller letters

(printed at Erfurt 1527) is lost in flourishes. Many of them are quite unreadable. They show the writing-master quite astray. Altogether saner German letters are those next shown. There is no mistaking there the broad sweeping lines which mean business, and they are freely and gracefully penned; the subsidiary flourishes are subsidiary, they keep their place, and merely furnish the space about the letter.

The influence of the goldsmith is to be traced, I think, in the initials of the elder Cranach, in which the outline of the letter is well-nigh lost in arabesque. These letters might almost have been designed to be beaten in gold.

The design errs on the side of the grotesque, to which beauty is sacrificed; but it took a master to design like that, and the letters are designed. In the next alphabet shown they are merely decorated by intertwining scrolls, which to some extent confuse them.

The elaboration of those Roman letters by Cranach indicates the lingering of the Gothic spirit in the artist. The Roman letter was for the most part not much tampered with by the designer of the Renaissance. He accepted the orthodox form, and emphasised the letter by ornament about it—just as we call attention to the commanding officer by putting gold lace on his coat, and, if he is very important, feathers in his hat. The idea is to distinguish the individual man or letter from the rank and file and to give him or it the dignity befitting the head of the column.

In the fairly well-shaped letters set in a framework of simple ornament—much the kind of thing that was done in damascening and niello—I am inclined to think that the character of the design comes from its having actually been cut in metal, not on wood.

In the Greek alphabet which follows the ornament does not go much further than a sort of scribble with the pen, just to relieve the plainness of the square panel enclosing the letter.

In the French initials the letters are again only in outline, relieved by a kind of niello pattern in black, which takes a square form though not enclosed in marginal lines. The breaking of the ground in that way gives importance to the letter, and in some cases makes it easier to read than it would have been merely an outline.

An English version of the same kind of thing is every way inferior to it. The thick line, to suggest shading on one side of the letters, is a vulgarity.

The French designs next shown are of a very different character. I say the designs because the letters are much the same kind of thing.

One very obvious way of giving emphasis to an initial is to show it in white on a black ground. That was quite commonly done. But, except on the very smallest scale, it was necessary to relieve the blackness of the ground by ornament in white upon it, if only to disguise any lack of solidity there might be in printing. And of course it was the simplest thing the engraver could do to engrave filigree ornament in white line. (Here, by the way, we get an early sixteenth-century instance of "white line" engraving which is claimed as the invention of Bewick. The ornamentists, at all events, were before him.) The background is frequently reduced from black to a dark grey tint by minute dots of white.

Many good Renaissance initials are blemished by a feeble indication of shading. But it is very plainly shown in other work of the same period that if it is desired to reduce the volume of the white in the letter, the way to do it is by a simple central line, which, though it may suggest that the letter is not flat but incised, does not pretend to give the effect of incision.

The feat of making black letters effective on a black ground is accomplished in the Greek alphabet shown, which is Venetian work. The black letters are in the first place outlined in white (even with a double line) and the ground is then diapered with white pattern, which reduces it practically to the value of tint.

In certain Roman letters (again Italian) we find the artist hesitating between two or three opinions. He has not made up his mind whether he will shade his letters or not (he is obviously least successful when he does). And he has not decided whether it is best to use figures or arabesque by way of accessory to the letter. To me he seems very much at his best in ornament.

Many ornamentists of the Renaissance were never so happy as when they were playing with little boys—"putti" as the Italians called them, a nondescript kind of boy, lending itself much better than babies would have done to the purposes of design. Whether on a white or a black ground, they form a rich background to the letter. The robust little men in the next alphabet have been ascribed (I don't know on what authority) to Dürer. They are the work of a strong man without too subtle a sense of beauty—which description would fit Dürer.

With regard to designs of this class, and to many others in which more distinct feeling for ornament is shown, I wish to point out that the design is not in the letter so much as in the background to it.

Some of the very best boy figures ever introduced into

initial letters are those ascribed to Holbein—and not unworthy of him. These little panels (they measure about 2 by 2 inches) are as large in treatment as a Greek coin; but this again is not to design initial letters, but to decorate the panels containing them. Just so in *The Dance of Death*, which Holbein also adapted to alphabetic use. But why turn the designs to that use—degrade them to it, I might say? They are not the best imaginable background to the letters, and the subjects would have been better. Holbein himself has shown that they were better without being mixed up with initial letters. I maintain that such designs are not designs for initials at all, though, when it is Holbein who makes them they may be something better.

To be decoratively right figures must be adapted very skillfully to the spaces about the letters. In sixteenth-century work the artist usually took care to do that, even in picturing the labours of Hercules, or Balaam and his ass and so on.

In the letters of the succeeding centuries, where figures are introduced, you rather feel that Bacchus, Ceres and the rest are trying to avoid the interference of the letter, or that, for example, it is only the attractions of Endymion which make the lady forget that her head is dangerously near the pointed serif of the E.

In the case of the other delicately engraved subjects you have the uncomfortable impression that the ill-shaped letters have been planted in front of them. They are art pictures spoilt.

A return to better things is shown in the alphabet by the late Godfrey Sykes. I don't say it is equal to the work of the Little Masters, but it shows at least that he went back to a source where there was inspiration left. Certainly we cannot afford to found ourselves upon a period when design appears to have run dry. We must go back to learn. That is my excuse for inflicting upon you so much ancient history.

(To be continued.)

ARCHITECTURE AND SUBSIDIARY ARTS.

ARCHITECTURE is mainly deserving of being ranked amongst the fine arts when it calls into action the varied and ingenious resources which the art of man has discovered and perfected. It is barely half a century since that the architect required, even for some of his largest works, churches, public buildings and palaces, little else than good masons, bricklayers, carpenters and plasterers. The bald and meagre imitations of ancient styles (excellent in themselves) which occupied the attention of most of the architects of the eighteenth century, to draw no nearer our own time, afforded no scope for artistic talent, and the works then executed, with a few exceptions, will never confer on their designers the ennobling title of artist. Thus no artists themselves, they called in no art to their aid, and the country was cumbered with ugly masses of stone and wood, in which the builder and not the artist alone triumphed, and to which the name of architecture in its full meaning is quite inapplicable. True architecture includes the practice of all the arts, and those buildings are the noblest, most satisfying and most interesting which have required and received the aid of the artist in marble, stone, wood, colour, metal, mosaic work, &c. The last-named branch of art has been entirely neglected in our own country until a few years ago, when it received some attention, for which we were indebted principally to the industry and talent of Digby Wyatt. In the adaptation of various coloured marbles to this particular and perfectly normal species of decoration no people have so distinguished themselves as the Tuscans, who have practised it with signal success, in more or less good taste, for many centuries. Of a peculiarly durable nature and capable of producing the most varied and charming effects, it has been applied by them to almost every purpose of external and internal ornament. Although the Duomo and Campanile of Florence are nearly covered with inlaid marble, sometimes in very beautiful designs, we do not think it well fitted for external use, except on a very small scale, even in so fine a climate as that of Italy; and although now, degraded by a false idea of its capabilities to the inlaying of tables with foolish and unmeaning representations of such subjects as books, music, pictures, &c., it was at one time, especially from the thirteenth to the sixteenth century, applied principally as an adjunct to architectural effect, and presents a large and interesting series of very beautiful designs, principally executed in black marble on white ground; the earliest examples are still the finest, and the inlaid pavements of San Miniato al Monte and of the Baptistery, executed at the commencement of the thirteenth century, exhibit fine specimens of its excellence and durability. The examples which are most admired are taken from pavements and memorial slabs. As regards the former, we need proffer no reasons for its use, wherever the application of an ornamental stone floor is required or its substitute for terra-cotta, but as regards its application to memorial slabs, there is a difference of opinion among experts.

NOTES AND COMMENTS.

WHEN the Observatoire of Paris was constructed after the plans of PERRAULT, three centuries ago, it might be considered as placed in the country, for it was beyond the Luxembourg. At present it is surrounded by houses, and the traffic is heavy enough to interfere with some of the delicate operations. But a new danger threatens the Observatoire. A laboratory is required for the students of the *Ponts et Chaussées*, and the minister considers no more suitable site is to be found than one adjoining the Observatoire. To have steam-engines, pile-driving machines, and, it may be, a steel hammer in such a place must affect the accuracy of the astronomical instruments. Remonstrances have accordingly been addressed to all the promoters of the new school. There may be a battle between Government departments, but we cannot imagine that French common sense would allow the Observatoire to be rendered useless, although the *Ponts et Chaussées* might be gainers.

It cannot be said that unusual expedition has been exercised in demolishing the Sorbonne. A good many years have elapsed since the square timbers which serve for scaffolding in Paris were first set up in order to commence the new buildings, and it is only now the last of the old buildings in the Rue de la Sorbonne has come under the hands of the wall-breakers. With that survivor will pass away one of the most renowned of European schools. In theology it was at one time supreme. It was founded in the thirteenth century by ROBERT OF SORBON for the poorest class of medical students. The professors were to be unpaid. RICHELIEU took great interest in the Sorbonne, and JACQUES LEMERCIER was employed by him as architect. The old buildings, however, were like the old educational system, and formed a maze. The Sorbonne lately erected typifies the power of science, for the planning is the result of determined principles.

THE subject of tendering came before the Master House Painters' Convention at Sheffield on Wednesday, when Mr. A. G. WHITE, of Liverpool, read a paper on "Standard Samples of Painters' Work: are they Practicable, and are they Desirable?" He said that when they were tendering for work the two dominant questions in their minds were, "Who is in for it?" and "What can I get off with?" He argued that it was high time something was done to check this, which was rapidly injuring their trade, and he suggested that the National Association of Master House Painters should establish classified standard samples of the various processes of finished work, below which the members should not be allowed to go. A discussion followed, and it was decided to refer the question to the general purposes committee of the Association for consideration, and if necessary recommendation. Mr. GOODYIER of Sheffield also read a paper condemning the present system of competitive tendering, and suggesting remedies. He said the present system was bringing down prices to such a point that the work was not worth having at all if it was to be done creditably. It had also largely conduced to the deterioration of their trade. His remedy was to charge a fee, according to scale, for all invited competitive tenders which were not accepted, and the abandoning of the old formula "estimates free." This would strike at the principal cause of the present state of affairs. Mr. A. G. WHITE was subsequently elected president for the ensuing year, Mr. WILLIAM ALLEN (South Shields) vice-president, Mr. PRESTON (Burnley) treasurer and Mr. SUTHERLAND was re-elected secretary. It was arranged to hold the Convention in 1898 at Liverpool.

A MEETING of some representatives of the building trades was held on Wednesday evening at the Craft School, Bow. Mr. LLEWELLYN SMITH, of the Board of Trade, who presided, said the object of the classes for the building trades in the Craft School was for the training of workmen, and not for the amateur, for they were of opinion the two could not be successfully mixed up together. A very considerable number of workmen in the district already took advantage of them. It was desired to make the school more useful to the great building trade. Mr. GEORGE DEW said the building trade had changed, and the title of "master craftsmen" no longer belonged to their employers. That was

unavoidable in the ordinary system of economy, therefore it was necessary to do more than was at present being done. Mr. HOLLOWAY deplored the fact that the system of apprenticeship had fallen out of practice, but his firm kept it up, for the apprentices turned out the best mechanics. As an encouragement to lads in his firm, on the completion of their apprenticeship, if they had behaved themselves during that term, they received 5*l.* to set themselves up with a set of tools. Such an encouragement was an inducement to lads to take up an apprenticeship; and institutions like that school ought never to take the place of apprenticeship, but simply to augment it. The advice given by Mr. HOLLOWAY should not be neglected. It will not be fortunate for the building trade if employers have to depend on schools for foremen and workmen. The opposition of the men is the true cause of the indifference to apprentices, the Unions, in that as in other important matters, being disposed to sacrifice the future to the present.

THE tall building appears to be frightening American Boston, "the hub of the universe," from its propriety. The local *Architectural Review* says:—"A not too well designed building of 125 feet in height is to compete with the tower of Trinity Church. Fortunately, the life of an apartment house is not likely to be as long as that of Trinity; but for the next thirty or forty years this towering mass will be a blot upon a square which has as distinct merit as any in America. In addition to this, the design for the embellishment of this square has been emasculated to a grass plot, because the city would not appropriate 80,000 dols., and private individuals considered that the work should not be done by private subscription. As a consequence, the city of Boston, half a million of people," says the reviewer, "lays down, rolls and curbs a grass plot in the centre of a square with Trinity Church on one side and the public library on the other, and, at the same time, permits the erection on its borders of a building which will absolutely destroy the scale and proportions of its neighbours. All this is ignominious. The tall apartment house is distinctly a curse to everyone but its owner and possibly its tenants. There should be definite laws against its erection higher than 60 feet in suburbs and 80 feet in cities. It is planted amid semi-suburban houses and villas, and next to rural churches or town-halls, dwarfing and stunting everything within sight. It is the epitome of greed and money-grubbing. In a city, where concentration has already occurred, it has a natural existence; elsewhere it is an anomaly, and is more of a nuisance than is a stable. The suburbs of all our large cities are infested with these perpendicular groups of cells. It is impossible to make fine architecture of them; it is improbable from their usual inception that they will be even good architecture. In some things we are a nation of extremists." The last sentence might be expressed by saying, "We belong to the Anglo-Saxon race, and demand as much liberty in treating building as is enjoyed in England."

SEVERAL of the articles which appeared in this Journal by Mr. F. J. WARDEN-STEVENS are reprinted, and form a volume entitled "Electrical Installations for Architects, Borough Surveyors, Civil Engineers, &c." (P. A. GILBERT WOOD). In our columns the articles obtained the attention they were entitled to receive, and in their new form we have no doubt they will be appreciated by an additional number of readers. They are intended for those who have little time to study abstract science, but who are eager to possess knowledge which can be utilised. As the articles embody the results of a varied experience in applying electricity they will, it is hoped, be useful to many men who have failed to obtain the information they require in the ordinary books, which are more professorial than practical in their aims.

*(Continued from last week.)**Some Thoughts on the Arrangement of German Choirs.*

IN no country of Northern Europe—England excepted—is the prejudice in favour of strict orientation more strong than in Germany. One of the most remarkable evidences of this feeling is the rejection by the people of that country of that feature which had been brought to such perfection in France during the thirteenth and fourteenth centuries, viz. the apsidally terminated choir with its procession path and radiating chapels—evidently preferring those forms of it that secured the strict orientation for their altars, which could not be attended to when the French arrangement was adopted. Occasionally, however, we find the Germans employing the circumambiently-aisled choir and corona of chapels, but they can scarcely ever be said to have handled this plan with the success characteristic of their neighbours.

As the examples of this choir termination are not very numerous in Germany, they may as well be dismissed now with a few words before entering upon the wider and more important subject of German aisleless choirs, and their various arrangements of apses.

Of clerestoried German choirs built after the French model, that of Cologne is indubitably the purest and most harmonious example, emulating those glorious apses which had arisen, and were still rising, all over France, as at Amiens, Auxerre, Beauvais, Rheims, Tours and Troyes.

With Cologne, in this respect, the humbler but beautiful and comparatively little visited church of Altenberg may be classed. Then we have some rather clumsy arrangements of the chevet in the great churches of Münster, Halberstadt, Lübeck and Upsala.*

That of Freiburg-im-Breisgau is better, and at Magdeburg the arrangement of the chapels round its apse is a remarkable evidence of the strict regard the Germans had for orientation. Here the altars are all placed with their fronts looking due west, cutting regardlessly, and in the oddest possible way, across the main architectural lines of the building.

We are now confronted with another class of circumambiently-aisled church, viz. the "hall" one, or that in which nave and aisles are vaulted at the same level, a class of church peculiarly Teutonic, and one to which frequent reference will have to be made in the course of these papers. The most successful examples of the procession-path in connection with a church of this kind are, perhaps, St. Laurence, Nuremberg, and the Franciscan church at Salzburg.† The church of Unna, between Dortmund and Soest, the Marien Kirche at Lipstadt,

the Nicolai Kirche at Zerbst and the Stifts Kirche at Naumburg are more northern specimens of the same arrangement; a somewhat clumsy one, necessitating the presence of an immense extinguisher-like mass of roofing that, to English eyes, is particularly offensive.

The parallel-triapsal plan was the one usually resorted to by the Northern Germans through all the epochs of Gothic architecture, to insure the reasons alluded to above. Romanesque and Transitional examples of this arrangement occur in Westphalia at Hüsten, where a church whose plan embraces a nave and aisles only has each terminating in an apse in the same line. At Brecken and St. Kilda's, Lügde, an aisleless choir terminates apsidally, while a smaller apse projects from the eastern face of either transept. The Kloster Kirche at Lippoldsberg is a cruciform structure with a very elongated nave. The choir is, however, very short, being only of two bays, and it terminates, together with its aisles, in exactly parallel apses, as at Hüsten.

Of Decorated Westphalian examples of the parallel-triapsal plan, Soest presents two remarkably fine and interesting ones in the Petri Kirche and the Wiesen-Kirche (St. Mary-in-the-Meadows). In the former case a triplet of pure Geometrical Decorated apses has been thrown out from a Romanesque nave and transepts; in the latter we have a lofty "hall" church, illustrating a much later phase of Middle Pointed, consisting of a nave and aisles only, each terminating in a perfect pentagonal apse, contrived by the sloping inwards of the first bay of the central apse on either side. With their tall transomed windows glowing with the most brilliant coeval painted glass, these three apses at the Wiesen-Kirche produce a spectacle of singular magnificence, taken in conjunction with the Mediæval instrumenta of which the building possesses such a store.

✠ The Cistercian church of Loccum—simple and severe as the generality of the churches built by that Order are—presents us with an example of the parallel quatre-apsidal arrangement, i.e. that in which the high altar finds its place in the end of a square-ended choir, while the lesser ones are located in small apses, of which there are two opening from the eastern side of either transept. Curiously, these small apses are not

seen externally, being formed in the thickness of the wall. ✠ At Zinna, in Saxony—another Cistercian establishment—the cinque-apsidal plan is met with. Here, however, the side apses are placed at the end of much longer projections, parallel with the walls of the main choir, and terminating in a line with it. Another specimen of the same arrangement—i.e. of five apses—is found at the ruined abbey of Paulinzelle, near Erfurt. Here the choir and its aisles ended each in an apse, while another projected from either transept. St. Ulrich, at Sangershausen, was similarly planned.

Hechlingen, Gernrode, Naumburg, Lausnitz and Wechselburg have each an aisleless apsidal choir, with, from the eastern face of each transept, another projection of the same shape, and are among the most interesting examples of the plan now under consideration in Saxony. At Naumburg the side apses project from the eastern pair of steeples.

Saxon Middle Pointed specimens of the parallel triapsal plan are found at Arnstadt, in the Marien Kirche at Mühlhausen, and in the Petri Kirche at Görlitz, but they do not call for any special description.

THE EASTERN CHOIR OF THE DOM AT NAUMBURG.

* Limburg Cathedral on the Lahn, and the Marien Kirche at Worms, have the processional aisle, but no radiating chapels.

† In this example a lightsome Late Pointed choir, exhibiting that flattened vaulting the German architects of the fifteenth century were so fond of, opens out of a solemn Romanesque nave in a manner perfectly startling in its sudden transition. The Franciscan church at Halberstadt, and the church at Görlitz present remarkable instances of the same type of vaulting.

The transverse-triapsal church—that in which the choir and transepts have semicircular or polygonal terminations—seems almost exclusively confined to the Rhenish provinces, where it is exemplified in St. Quirinus at Neuss, St. Maria in Capitolio, Gross St. Martin and the Apostles at Cologne, and in the Minster at Bonn.*

In Westphalia we have a solitary example of it in the Romanesque church at Plettenberg,† while Hesse presents it in one of Germany's earliest complete Gothic churches—St. Elizabeth at Marburg.

Square Eastern Terminations.

Another eastern termination—one that is popularly supposed to be purely insular—now comes before our notice, viz. the rectangular one. Although it rarely makes its appearance down the Rhine, the square end is as common in Westphalia, through all the epochs of Gothic, as the apse, and in the long Middle Pointed choirs of the cathedral at Paderborn and the Minster at Herford, and in the Early Pointed ones of the cathedral and church of St. John at Osnabrück, it is seen on the most imposing scale, albeit sometimes deficient in the accompaniments which give that indescribable charm and grace to such English east ends, with their magnificent walls of glass, as Carlisle and Selby, Lincoln and Ripon.

At Osnabrück Cathedral, where the fenestration is effected by a triplet of very severe lancets, the choir was originally aisleless, but in Middle Pointed times an ambulatory was formed, and returned round the back of the east end, without, however, any arches of communication being cut in the walls of the choir's sides or end. Such an arrangement, which has a very peculiar effect, can also be seen in the conventual church at Marienfeld, between Münster and Bielefeld. Sometimes the aisles of a square-ended choir terminate in the same line with it, as in the Minster at Essen and the church at Büren; while of other rectangularly-terminated Westphalian churches, the Busdorf-Kirche at Paderborn, St. Maria in Hohe at Soest, the Pfarr Kirche at Billerbeck, the interesting Cistercian church at Loccum, and the Stadt Kirche at Frondenberg, where a charmingly traceried rose surmounts a triplet of small lancets, present a variety of styles to the student of this particular form of eastern termination.

The square east end is occasionally met with in Saxony, but never on a very grandiose scale. Romanesque churches in that part of Germany generally exhibit the shallow semicircular apse—distinct both in height and width from the eastern limb—while churches of the Middle and Late Pointed periods are almost invariably closed by a graceful polygonal apse, lighted

by tall windows of two or three lights. The churches at Nordhausen and Grimma—both with triplets of lancets lighting their eastern walls—the Augustinian church and several others of minor importance in Erfurt, and the ruined church of Stadt-Roda, whose elevation recalls very forcibly our beautiful Valle Crucis, go a considerable way towards exhausting the list of quadrangularly terminated churches in Saxony.

Aisles, Clerestories, and Anomalous Plans.

The Reformation, the neglect and bad taste of the last century, and the secularisation of such conventual churches as survived it, early in the present century, have, from a ritualistic point of view—I use the word ritualistic in its true sense—tended to deprive the North German churches of a considerable share of the interest they once possessed, but the churches which were once conventual (*Stifts Kirchen*) may be distinguished from those which were simply parochial (*Pfarr Kirchen*) by a much greater length of choir, a difference particularly marked in buildings of the fourteenth and fifteenth centuries. The Minorite, or Grau Kloster Kirche at Soest, and the church built by the same order at Münster have immensely deep choirs attached to naves of the "hall" type; while at St. Mary-in-the-Meadows in the first named town, and St. Lambert in the second, which were parochial edifices only, we find a much shorter choir, opening out of a nave of the same lofty unclerestoried type. Sometimes the churches built by the Preaching Orders, such as the Dominicans and Franciscans, are of immense length, as at Erfurt and Halberstadt. At Erfurt, where we once more meet with the clerestory, there is a difference in the planning of two of these, otherwise similar, great structures. The Dominican church in that town has its lofty, narrow, lean-to aisles carried along the whole of the fifteen bays, leaving only the apse—five sides of a decagon—projecting beyond; while in the Franciscan church the aisles are coextensive only with the nave, the five-bayed, apsidal choir being destitute of those appendages.

It was quite a relief to meet these two great clerestoried churches at Erfurt, after such a succession of "hall" churches as were encountered in Westphalia and Lower Saxony, elegant as many of such structures, with their aisleless apsidal choirs—veritable lanterns of painted glass—are.

Some conventual churches have only one aisle to their naves, as Romersdorff, the Minorite church at Andernach, the churches at Hamm and Höxter, and the Franciscan church at Ulm. Clerestoried parish churches, with a choir consisting only of an apse tacked on, are not uncommon in the north-west districts of Germany. Such are St. Matthias at Maastricht, St. Foilan at Aix-la-Chapelle, the Stadt Kirche at München Gladbach, and St. Mary at Oberwesel. At Xanten, the collegiate church of St. Victor is a very rich clerestoried example of a transeptless building, exhibiting in its arrangement a fusion of the French and German methods of apsidal planning.

The non-employment of the transept even in churches of such dimensions as Ulm, Vienna and Erfurt is one of the most striking national characteristics of the later German Pointed style. At Freiburg-im-Breisgau, the Romanesque transepts have been almost entirely obliterated by the rebuilding of the cathedral in Middle Pointed.

INTERIOR OF ST. MARY-IN-MEADOWS, SOEST.

* In Belgium we have an interesting example of the transverse-triapsal arrangement in the cathedral at Tournai, whose transepts with their cluster of five towers have a very German look. Noyon Cathedral, long connected with Tournai, exhibits the same plan. Several churches in the north-east of France betray Germanisms—notably Toul Cathedral and St. Loup at Châlons, with their aisleless apsidal choirs, and the same spirit seems to have influenced Verdun Cathedral, and the churches of St. Benigne and Notre Dame at Dijon.

† At Paderborn Cathedral the Middle Pointed north transept has an apse forming seven sides of a dodecagon, each lighted by a tall window of two compartments.

I fear I have already dwelt too long on plans, but I cannot quit this most fascinating and interesting branch of the subject without calling attention to such anomalous ones as those of the twelve-sided chapel at Drüggelte, near Soëst; the Nikolai-Kapelle in the same town, consisting of a nave divided down its centre by a row of round arches on slender shafts; the two-bayed, two-aisled, parallel-apsidal church at Girkhausen in South Westphalia; the double-storeyed castle-chapels at Warburg and Steinfurth in Westphalia, and those of St. Ulrich at Goslar, Landsberg and Conradsberg, in Saxony. The church at Schwartz Rheindorf, opposite Bonn, may fall into this last-named class, as regards its elevation. Nor must mention be omitted of the Dom at Aix-la-Chapelle and St. Gereon's Church at Cologne, where an aisleless choir is attached to an octagon and a decagon respectively; of the multi-foliated plan exhibited by the Liebfrau-Kirche at Trèves; of the double-choired cathedrals and churches of Bamberg, Gernrode, Hildesheim, Laach, Mayence, Naumburg, Oppenheim and Trèves; and of such churches as the Dom at Münster, and the Apostles and St. Cunibert's at Cologne, where the western transept not only forms a pleasing feature in the external outline, but affords a noble approach to the interior—the floor space at the crux formed by it being left unbenched.

There are other examples of short western transepts projecting either from a tower, as at St. Quirinus, Neuss, or from the western elevation, as at St. Andrew, Cologne, but in both these instances they open into the nave only above an internal narthex or construction gallery. This is a feature of frequent occurrence in the German Romanesque churches, and to be seen on a particularly impressive scale, besides in the two churches quoted above, at St. Patroclus and St. Peter at Soëst, at Lippoldsberg and Gandersheim, all in Westphalia, and at Hechlingen and Wechselburg, in Saxony.

(To be continued.)

THE ARCHITECTURAL ASSOCIATION.

THE opening meeting for the session 1897-98 of this Association took place on Friday evening, Mr. Hampden W. Pratt, president, in the chair.

Mr. Beresford Pite, past president, moved the adoption of the committee's report and the balance-sheet for 1896-97. The past session, he said, had in every way been a promising one, and showed an increase of 77 members, bringing up the total to 1,190. The various classes continued to improve, and although still dependent on its friends, the Association was financially in a satisfactory condition.

The motion was seconded by Mr. F. G. F. Hooper.

Mr. Banister F. Fletcher moved a vote of thanks to Messrs. H. P. G. Maule and M. Garbutt for auditing the accounts for 1896-97.

Mr. E. Howley Sim seconded the proposal, which was carried unanimously.

It was announced that copies of the A.A. excursion photos might be purchased of Mr. F. J. O. Smith.

The following were reinstated members:—Messrs. G. H. Smith, A. Lamb, A. W. Pocock, jun., A. Lovejoy, G. E. Withers, A. G. Turner and G. Bailey.

The President then distributed the prizes.

A.A. Travelling Studentship, value 25*l.*, and bronze medal, E. H. Evans; second prize, not awarded.

Architectural Association silver medal and 10*l.* 10*s.*, H. Inigo Triggs; hon. mention, F. D. Clapham.

Essay Prize, value 10*l.* 10*s.*, and silver medal, Alexander Wood.

The Andrew Oliver Prize, first prize, value 3*l.* 3*s.*, not awarded; second prize, value 2*l.* 2*s.*, not awarded.

The Arthur Cates Scholarship, value 10*l.* 10*s.*, H. T. Bromley.

Measured Drawings Prize, value 5*l.* 5*s.*, C. H. F. Comyn; hon. mention, H. Farquharson.

Discussion Section Prize and Architectural Union Company's Prize, not awarded.

School of Handicraft (Masonry) bronze medal, H. C. Lander.

LECTURE SIDE.

Division I.—R. H. Spalding, silver medal and certificate; A. Wood, bronze medal; H. White, hon. mention.

Division II.—G. S. Nicol, silver medal and certificate; H. C. Trimnell, bronze medal; E. Hale, hon. mention.

STUDIO SIDE.

Division I.—V. Wilkins, silver medal and certificate; T. Bee, bronze medal; R. H. Spalding, hon. mention.

Division II.—W. H. Ward, silver medal and certificate.

ORDER OF MERIT.—DIVISION I.

Greek and Roman Orders.—C. Brée, certificate; H. White, J. E. Franck.

Elementary Construction and Materials.—C. Brée, certificate and book; W. C. Butterworth, W. J. Davies.

English Architecture.—Alexander Wood, certificate; J. E. Franck, R. H. Spalding.

Elementary Physics, Formulae and Calculations.—J. E. Franck, certificate and book; R. H. Spalding, H. White.

Plane and Solid Geometry.—R. H. Spalding, certificate and book; R. C. Hall, J. E. Franck.

Mensuration, Land Surveying and Levelling.—J. D. Hunter, certificate; L. G. Detmar, R. H. Spalding.

DIVISION II.

History of Architecture.—G. S. Nicol, certificate and book; H. Badcock, S. E. Barrow.

Materials, their Nature and Application.—H. C. Trimnell, certificate and book; H. Badcock, G. S. Nicol.

Stresses and Strains.—G. S. Nicol, certificate; F. J. O. Smith, T. W. Aldwinckle, jun.

Construction.—P. Morris, certificate and book; H. C. Trimnell, G. S. Nicol.

Hygiene (Drainage and Water Supply).—F. J. O. Smith, certificate and book; T. W. Aldwinckle, jun., H. C. Trimnell.

Hygiene (Materials and Construction, Ventilation, Lighting and Heating).—F. J. O. Smith, certificate; G. S. Nicol, T. W. Aldwinckle, jun.

Specifications and Estimates.—S. E. Barrow, certificate; H. C. Trimnell, T. W. Aldwinckle, jun.

Professional Practice.—T. W. Aldwinckle, jun., G. S. Nicol, S. E. Barrow. No certificate was awarded in this class because there were only seven students, whereas eight is the number required by the rules.

Elementary Class of Design.—F. N. Reckitt, silver medal with scholarship value 5*l.* 5*s.* and certificate; C. L. Brierley, bronze medal and certificate; T. F. Green, hon. mention and certificate; J. S. Lee, hon. mention.

In the advanced class of design no award was made.

Before reading his address the President said there was one pleasing duty which devolved on him that night—the presentation of a silver tea and coffee service to Mr. D. G. Driver, their assistant secretary. When Mr. Driver came back from his holiday they learnt he had brought a wife with him, and therefore some members made the gift to mark their appreciation of his five years' work with the Association.

Mr. Driver, in returning thanks, said he had been greatly helped in his work by the kindness and good-fellowship of the members.

The President's Address.

The President then addressed the meeting. He said:—There are certain periods in the history of an institution when it is convenient and customary, not to say interesting and instructive, to look back and trace the course of events—in other words, to review the past; also to consider the present, and look forward to the future. For fifty years the Architectural Association has striven to supply the needs and promote the welfare of the architectural student, and it must be very gratifying to the founders of the Society—a few of whom happily survive—to look upon the flourishing body that still bears the name of the Architectural Association.

The object of establishing the Association was "to enable young men who are studying architecture to meet for general improvement in the various branches of their art." In a circular issued at the origination of the Society it was pointed out that "the great advantages a scheme like this, if carried out, would offer to the architectural student must be obvious at a glance. By this institution all the future members of the profession, their objects, their labours, their studies, would become known to each other. The incalculable advantages this knowledge and acquaintance would afford to those engaged in the same study; the mutual instruction and valuable assistance each could afford; the honourable spirit of emulation that would be engendered; the furtherance of their art in general, and the happy effect that must be produced by all the future architects becoming a band of friends intimately associated with each other in their plans and projects must and will prove of the greatest advantage to all those connected with the scheme." This forecast has been fulfilled to the letter, and we may truly say that the bonds which unite us to-day are as strong and as powerful as ever they were, and no one but a Hercules could sever or destroy them.

There is scarcely anything recorded of the early years of the Association; its proceedings were not reported as they are now, and it is mainly through the unpublished minutes of its meetings that we are able to glean something of its history. As we turn over the pages of its log-book we may note the chief incidents of the voyage, and trace its progress from year to year. The question of public competitions seems to have been early considered, for in 1850 a code of regulations was drawn up and issued; this interesting document was published in the jubilee number of "Architectural Association Notes," and contained some excellent suggestions which the agitation of many years has not succeeded in satisfactorily settling. As evidence of a desire to enlarge its scope, we find that Mr. R. Kerr

in 1852 laid before the committee a scheme for the formation of an Architectural Academy, comprising courses of study, professorships, lectures, graduation, &c., and a resolution was passed to the effect that "the proposition is well worthy the consideration of the profession generally, and that any assistance toward the furtherance of this object that can be rendered by the Association shall be liberally given."

Unfortunately, financial troubles proved a stumbling-block to the smooth working of the Society, chiefly owing to the members getting into arrear with their subscriptions—an experience not confined, by the way, to the infancy and youth of the Association, as subsequent treasurers can testify; but at the outset it was a serious matter, and led to the appointment of a committee of investigation in 1855. This committee reported that they "found the Association in a state of apathy, torpor and depression unparalleled in former sessions," the financial statements had been misleading owing to the concealment of heavy liabilities, and the management of the Society called for improvement. It was further suggested that a lending library should be formed, and an "Architectural Association Magazine" might, if published, be expected to pay its own expenses. The report concluded with an earnest appeal for a renewal of the enthusiasm which characterised the members at the formation of the Society. Following closely upon the reception of this report came a proposal to memorialise the Institute "for the establishment of an examination which should eventually serve as the basis for the issue of such a diploma as shall certify that the holder thereof is fully qualified to practise as an architect." A reply was received from the Institute in 1856 to the effect that the Council felt it was premature to pronounce an opinion upon so important a subject, and that before they could recommend the Institute to undertake such a charge it would be necessary to ascertain the opinion of the profession generally, at the same time they would be able to come to a sounder judgment after some experience of the district surveyors' examination recently instituted. Disappointment followed this decision, interest in the Society continued to flag, and in May 1856 a special meeting was held, at which a resolution was brought forward to terminate the existence of the Association; this, however, was defeated by a large majority, thus indicating that there was at any rate some vitality amongst the members. In the following month an important letter was received from the Institute suggesting an amalgamation of the Association with that body. This communication was duly considered, and a resolution passed to the effect that it is not expedient for the Association to join the Institute on the terms suggested. The crisis through which the Association passed in 1856 was followed by an awakening interest in its welfare, and a committee was appointed to take into consideration the defective means of architectural education and the desirability of forming classes for the special study of subjects immediately connected with professional practice.

In January 1857 a conversazione was held, at which Mr. Ruskin was present and read a paper on "The Use of Imagination in Modern Architectural Design," and though forty years have passed since then it is interesting to recall and record some of the words of a master in art who in times past has kindled so much enthusiasm in the architectural breast. Mr. Ruskin said:—"If they were asked abruptly, and required to answer shortly, what were the qualities which distinguished great artists from mean artists, he believed they might reply—first, their imagination; second, their industry. Some of them might doubt the justice of the necessity of attaching so much importance to this latter quality, because there might be dull men who were industrious and clever men who were indolent; but though the industrious man might be dull and the indolent man might be clever, he had never known a great man who was not industrious. But though this quality of industry was essential to an artist, it did not make an artist; for many people were always busy whose doings are of little worth. Neither did feeling make the artist; but the gift which distinctively made the artist—without which he would be feeble in life and forgotten in death—was that of imagination. Imagination was not manipulation, or calculation, or attention; it was something more, something higher than all or any of these. If an architect lays his bricks and stones well, we praise him for his manipulation; if he keeps well within his contract, we praise him for his calculation; and if he arranges his beams so that nobody drops through his floors, we praise him for his caution. But, if he is to be a great architect, he must do something more than possess and exercise these qualities." After referring with regret to the separation between sculpture and architecture in modern times and to the field opened to the fancy by the junction of sculpture with architecture, he remarked that "nearly every other art was limited in its space; but was there anything within the range of sight, or thought, or conception which might not be of use to the architect, or in which an interest might not be awakened to the advantage of his art?" Concluding an eloquent address, Mr. Ruskin said:—"So soon as they desired to build largely, they would find that their work must

be associative; one could not carve a whole cathedral himself; either their own work must be disgraced or they must raise their fellow-designers to some correspondence of power. They would take the lead in disposing of their building, but they must trust to the genius and invention of others in the disposal of its detail, and in doing this, too, they must rejoice in the very powers that may promise to rival them. If they endeavoured to depress or disguise the talents of their subordinates, they were lost to their art, for it was their own prosperity they were seeking, and their own skill that they were striving to perpetuate. He placed no utopian standard before them; he had said that they must surrender their own pre-eminence to their love of building, and whomsoever they found better able to do what would adorn it than they were, that person they were to give place to and rejoice at seeing their edifice growing more beautiful under his chisel, and next rejoicing that they had done kindly. The man who sees capacity in another and does not acknowledge it, or assist in bringing it forth, is not the refuser of a kindness, but the committer of an injury. They had the sweet consciousness that as their art embraced a wider field than all others, so it was more profound and holy than all others. The artist when his pupil is perfect must see him leave his room that he may pursue his destiny perhaps as an opponent in toil, but architects alone were called by kindness to fraternity of toil. Those massive piles which rise above the domestic roofs of our ancient cities have a meaning more profound and true than is commonly attached to them. Men say they are good for worship, but so is every mountain glen and rough sea-shore; they have the indisputable and distinguished glory that their mighty walls were raised by men who have given aid to each other in their weakness, and the strength of their structure has its foundations on manly friendship, which conduces to awaken the sweeter cadences and symmetry of the human soul."

What effect Mr. Ruskin's eloquent address had on the members is not recorded, but it is pleasing to find that the committee were able at the commencement of the next session to congratulate the members on the general improvement which had taken place in the prospects and financial position of the Association, which was at length freed from its embarrassments, a fund having been raised for the purpose. A movement was on foot at this period to provide a home for architectural bodies in London; the Architectural Union Company had been formed and was erecting a building in Conduit Street, and after prolonged negotiations the Association arranged terms and removed from Lyon's Inn Hall, holding its first meeting at 9 Conduit Street on April 1, 1859. In that year for the first time a prize was awarded in the class of design, and a prize essay instituted, the subject being "Street Architecture and its Proper Treatment." The acquisition of new premises might have been expected to mark a renewal of vigour in the work of the Association, but strange to say, only twelve months had elapsed when a resolution was passed regretting the want of support afforded by the members and asking the committee to consider and report whether there was any course short of closing its operations. The committee recommended that all office bearers, with the exception of three, should for the next session be members who had never held office before; accordingly some new blood was introduced into the direction of affairs.

A circular having been issued by the R.I.B.A., inviting suggestions on the establishment of a voluntary examination, the Association held two meetings at the close of 1860, and after fully discussing the matter passed two resolutions:—
1. "That in the opinion of the Architectural Association a strictly voluntary examination should be instituted with a view of guiding the student in architecture to such a course of study as would enable him to arrive at competence in his profession."
2. "That in the event of a professional examination being insisted upon, it should be limited to those subjects which bear directly upon the practice of the profession, and this Association is apprehensive that any examination upon the principles of taste might lead to results unfavourable to the progress of art."

In 1860 botany and modelling classes were formed, the latter proving very successful. In 1862 the library, which had been in course of formation for some time, was at length opened. In the same year Saturday afternoon visits were organised, the first being to Westminster Abbey, a prize being given for the best account of the visit. At the conversazione in October 1862 a musical programme was introduced for the first time, the services of the artistes being gratuitous. In 1863 the voluntary examination class was established for the study of practical subjects with special reference to the examination then instituted, the Association having pledged itself to use all its influence to induce the members to qualify themselves for it. In the following year a class for the study of figure drawing was formed under the direction of Mr. E. J. Poynter, and was so attractive that fifty members joined it. A water-colour class was subsequently started. In 1867 the A.A. sketch book was commenced, the parts being issued monthly at a subscription of one guinea per annum, as now, and an excellent publication

it has always been. At this time the class of construction was formed to carry on the work formerly undertaken by the voluntary examination class, and a year later the elementary class of design was started. The Association had now settled down to steady work, for in session 1868-69 a number of sub-committees were appointed and a balance sheet published for the first time, showing an income of about 240*l.* and a substantial sum in hand. It became necessary also to compile a catalogue of the library, and this was issued in 1869.

We next come to an important report drawn up in 1869 by a joint committee of the Institute, the Academy, the Architectural Museum, the Association and the Architectural Exhibition, on the question of establishing a "School of Art accessory to Architecture." This committee carefully investigated the scheme of the voluntary examination, and arrived at the conclusion that its failure was due to:—1. The absence of a formal certificate of having passed the examination. 2. The want of such a stimulus or pressure as would make the passing of the examination professionally necessary. 3. Inefficient preliminary education. 4. Want of system in architectural education. They accordingly recommended:—1. That a text-book or pamphlet should be prepared containing a complete curriculum of study for the architectural student. 2. That a certificate be granted to all who pass the voluntary examination. 3. That at some future period the membership of the Institute be made dependent on the passing of the voluntary examination in the class of proficiency. 4. That a preliminary examination be held in elementary subjects, open to all students who have been at least one year in an architect's office. 5. That the Institute should assist the Association to carry out the proposed drawing school. 6. That a committee be appointed to compile the text-book referred to. As a result of the fifth recommendation architectural art classes were established at the Architectural Museum under the management of a committee composed of representatives of the Institute, the Museum and the Association. These classes were commenced in 1870, and comprised figure drawing and architectural ornament, the latter being conducted by well-known architects as visitors. For two years the Association contributed 25*l.* annually towards the expenses of these classes, which, however, soon languished.

The first annual excursion took place in 1870, when Lincoln and district were visited, the party being conducted by the late Mr. Edmund Sharpe; and it may be remarked here that every year since then some fresh district has been visited. During the next ten years (1870-80) no important change or event took place; the membership grew from 500 to 800; two new classes were formed, viz. for the study of colour decoration and architectural science, the latter being subsequently called the advanced class of construction; some courses of lectures were also delivered; special arrangements were introduced for the benefit of country members in connection with the classes and library, and the Birmingham Architectural Association was admitted as a provincial branch. The Institute opened its library to members of the Association under twenty-three years of age. New and amplified rules were adopted in 1877, and four years later the entrance-fee was raised to one guinea. Additional rooms were taken at Conduit Street in 1879; the Architectural Association Medal was founded in that year, and the Architectural Association Travelling Studentship two years after, when a sum of nearly 700*l.* was subscribed by past and present members to provide the necessary funds.

In 1881-82 the committee thought it desirable to vary somewhat the arrangement of the classes, with a view to making them specially useful to members preparing for the new obligatory examination of the Institute, which commenced in 1882. Courses of lectures on the history of architecture and on construction were given and a new class started for the study of planning and specification writing.

In 1884 a special education committee was appointed to inquire thoroughly into the general organisation of the Association, with a view to further systematise its working and extend its usefulness, and a scheme was adopted in 1885 for amending and consolidating the work. The main feature consisted in forming two defined divisions of study, called the elementary and the advanced, the former comprising elementary classes of design and construction, preceded by lectures on history and construction, and the latter consisting of classes of design, colour decoration, advanced construction, quantities and surveying, but no lectures. The work was conducted by visitors, who were formed into a committee of advice. An attempt was made at this time to increase the subscription of members to one guinea, with the object of affording increased educational advantages, but the proposal was defeated by a small majority. In 1885 the Saturday vacation visits were first organised, and in the ensuing session many improvements were effected in the library, viz. a new system of registration, the addition of a reading-room, and the opening of the library twice a week instead of once. In 1886-87 a practical class of masonry was carried on as an experiment at the City and Guilds Institution, and a series of lectures started on graphic statics. A noteworthy step was the issue in April 1887 of the

first number of A.A. Notes at a small subscription, the desirability of providing a means of intercommunication amongst the members being at length realised, though it was not until four years later, when it was issued free to all members, that its purpose was more completely fulfilled.

The gradual increase in the number of members and the large attendance at the ordinary meetings forced the committee to consider the necessity of providing better accommodation, and by the kindness of the Institute we were permitted to hold our meetings in their room during session 1887-88, a privilege which has been courteously extended to us ever since. About this time rules were passed to facilitate a scheme of affiliation with the desire of creating a bond of union between the Association and provincial societies; the Birmingham and Glasgow associations joined us, but the arrangement did not long exist. An elementary class of ornament and colour decoration now appeared and was well taken up, and two years later the sketching and measuring class was formed for the purpose of visiting buildings in the neighbourhood of London during the summer. At the same time an A.A. cycling club was organised with the object of making runs to places of architectural interest, but this club soon disappeared, and notwithstanding the growing popularity of cycling no attempt has been made to restart the club. Another club was founded in 1888, viz. the Lyric Club, one of the objects being to promote friendly intercourse among the members; and those who appreciate the social advantages of music, dancing and smoking are still provided for at this club. Reference may be made here to the Camera Club, though founded at a later date (1893). Apparently, this club is not so prosperous as it was at first, and a hope may be expressed here that some effort will be made to revive its usefulness.

We have now arrived at the last great movement in the Association. In 1889 a special committee on education was appointed, and after exhaustive inquiries its recommendations were approved by the general body in May 1890. Following this a special committee was appointed to consider the revision of the rules, a new constitution and by-laws being adopted by the general body in the following January. These included the raising of the entrance fee to 2*l.* 2*s.* and the subscription to 1*l.* 1*s.* to all members elected after 1890; and also provided for the appointment of paid officials. A reorganisation committee was next appointed to prepare the new education scheme and resulted in the new curriculum. In order to establish the new scheme and provide for the extra cost and risk incidental thereto, as well as the outlay involved in obtaining suitable premises, an appeal was issued and generously responded to by members of the profession. The scheme provided for a complete course of study extending over four years, that being considered as the least time that should be given to the study of the subjects. It was laid down that the aim of the courses was to help members to fit themselves for their work as architects, by providing the means by which they may supplement the training acquired in offices; the principal object not being to prepare candidates for the examinations, although the courses were chiefly based upon the programme of the examinations.

Premises having been secured in Great Marlborough Street and adapted to meet our requirements, the new scheme was launched in 1891-92. From the outset the first and second years' courses were well supported, the third being thinly attended, and the fourth not fully started. In 1892-93 Divisions I. and II. continued to be well supported, and Divisions III. and IV. showed improvement. In 1893-94 there was a poor attendance in Divisions III. and IV., indicating the necessity of rearranging these divisions. Accordingly, in 1894-95 the complete course was arranged in three divisions, but the attendance in Division III. was again disappointing, and a special committee was appointed to inquire into the working of the classes. As an outcome of this inquiry the Institute agreed to alter the dates of the examinations so as to avoid interference with the working of the classes. In 1895-96 the curriculum was arranged in two divisions, the complete course extending over four years, and a school of design started, being attended with considerable success. Last session the work of the classes and studio showed a continued improvement, especially in Division I. The school of design and handicraft was most successful and encouraging; forty students joined the elementary class, and the whole session was devoted to one subject, which produced good results. Eight students joined the advanced class, the syllabus of which was amended as it was found desirable to have more than one subject. The Technical Education Board arranged special handicraft classes for the school, and these were appreciated by the students. The discussion section affords opportunities for the study and discussion of those subjects and difficulties which occur in actual practice; this is a most valuable part of our work, and it is gratifying to note its continued success.

A record of the Association transactions would not be complete without a reference to the special meeting held in December 1893, when the question of the admission of ladies into membership of the Association provoked a lively discus-

sion, and the proposal was defeated by a large majority. Since then no one has come forward to advocate the cause of the ladies, but we have, on several occasions, been reminded of such a class of students on the boards of the A.A. soirée stage.

We have now traced in outline the work and progress of the Association during the fifty years of its existence. There are, of course, many incidents and details that would have been interesting to enlarge upon, but on an occasion like this it would be impossible to do so. There are, too, many names that might have been mentioned as identified with the course of events, but it would be undesirable to single out a few where so many have borne an active part. The history of the Association is marked throughout its career by a fixed determination on the part of its members to maintain its independence, to uphold its traditions, to overcome all difficulties, to grapple with changing circumstances, to keep abreast of the times, to seek the counsel of its best friends, to encourage and help the young student, to provide the best training and education at its command, to keep in touch with those who have passed through the student stage, to keep alive the memories and maintain the friendship of those who have retired from active service, and above all to advance the noble art of architecture. May the same devotion and self-sacrifice, the same enthusiasm and loyalty, characterise the men who are entering our ranks to-day, so that the Association may accomplish in the future greater things than in the past, and heaven smile upon the works of their hands.

We have been looking into the past and rejoicing in our year of Jubilee at all that has been accomplished; let us turn for a moment to the present. We have entered upon a new session with the largest roll of members ever recorded, viz. 1,150. It may be interesting to note that of this number 11 have been members for forty years and upwards; 60 for thirty years and upwards; 110 for twenty-five years and upwards; 180 for twenty years and upwards; 302 for fifteen years and upwards, and 552 for ten years and upwards. Seven hundred and forty-eight of our present number joined before the subscription was raised in 1891, so that 402 have come in and remained since then. Various conclusions can, of course, be drawn from these or any other figures, but this at least may be said, that the Association has succeeded in retaining many of its best and most valued friends, who are ever ready to testify to the great advantages they have derived from its membership. On the other hand, there is a solid army of young men, many as yet untried, who are destined to take up the reins of government before long, and who have opportunities which, if wisely used, may be productive of lasting good to their own and future generations in raising the status of the profession and in the advancement of architecture as a living art.

There is one point in our comprehensive scheme of education which demands attention, and continues to disappoint us. While the students in Division I. attend in very satisfactory numbers on the whole (and, in fact, the present accommodation is somewhat strained to properly provide for them), those in Division II. are comparatively few. What becomes of those who have passed through the first stage? It is very evident that a large proportion of them do not continue their studies and complete the course we wish them to follow. This is a problem that we have not succeeded in solving yet, and it suggests the advisability of making individual inquiries of those who have passed through Division I. to ascertain the causes which apparently lead them to abandon the higher and more advanced studies provided for them.

The combination of practical with theoretical instruction is also a subject which is exercising the minds of many. At present the facilities we offer our students in this direction are very limited. In the handicraft classes last session the students were enabled to attend a course of manual training in masonry and leadwork, thanks to arrangements made by the Technical Education Board, and this session the Board has kindly arranged for a series of workshop demonstrations in stone-working to be given at the Regent Street Polytechnic.

There appears to be a difference of opinion as to how far it is necessary or desirable that an architect should be able to put his own hand to the work of any trade. If it is an advantage that an architect should have actual manual experience, would it not be better that a student should be taught or apprenticed to one trade—say mason or carpenter—before he serves his articles? Such a course would seem to be the most convenient as well as the most practicable; later on he might with advantage gain considerable knowledge in other crafts, not necessarily by handling the materials and tools, but by observation either on works, in shops or in craft classes; while later still the superintendence of works, either as clerk of works or otherwise, would be an experience of great practical value. After all, the years of a student are limited, and even if he should make the very best use of his opportunities he cannot expect to accomplish very much in this department of his education. By far the most useful and appropriate thing for an architectural student is modelling, and it is a question whether this is not worth all the other crafts put together. The tendency of the

times is, perhaps, to make too much of the manual work undertaken at the technical institutes. It is valuable as far as it goes, especially in the more scientific subjects, but it is a fallacy to suppose that it can in any degree supersede the training which an apprentice to his trade must and should acquire in the workshop, where the everyday practical problems have to be dealt with.

You will have gathered from the report of the committee for last session that it has been resolved to commemorate the Jubilee of the Association by establishing a fund for acquiring new premises, suitable and adequate for the work carried on. It would be quite contrary to the wishes and feelings of all who have the interest of the Association at heart, to let so important an occasion pass without making some special effort to permanently benefit a Society that has done so much to further the cause of architectural education, and in whose welfare the whole profession is concerned. Various suggestions have been made and discussed, but there seemed to be one predominant object which overshadowed all others. For the last few years the cry has gone forth for increased and better accommodation; numerous efforts have been made to obtain premises, but hitherto without success, and seeing that our need is as great as ever it has been determined to commemorate the Jubilee in the way mentioned. We have sought the advice and help of friends who have aided the Association generously in the past, and they have intimated their readiness to support us again, provided we are prepared with some definite scheme. This is a most reasonable attitude, hence we are now going forward in the matter with renewed energy and determination, and are hopeful that the way is opening up for obtaining a site on which premises could be erected to provide studios and classrooms, library, reading-room and offices, a common-room, and last, but not least, a meeting-room, so that under one roof we may combine all the essential accommodation for educational and social purposes. The provision of workshops might with advantage be arranged in a separate building more suitable for the purpose, if satisfactory arrangements could not be made with any of the public craft schools. This outline of a scheme may seem to indicate a large undertaking, but if carried out on the lines we have in view, and which it would be premature to discuss, there is little doubt but that it could be satisfactorily accomplished. Our desire is to formulate a definite scheme that is practicable and attainable within reasonable limits and a reasonable period, not forgetting, at the same time, that it should worthily commemorate our Jubilee.

The question of establishing a Municipal School of Architecture has been talked of and may yet come; but such an institution could never do the work that the Association undertakes, neither could the Association open its doors to outsiders and accept grants or subsidies from county councils or other public bodies without sacrificing its freedom and ceasing to fulfil the objects for which it exists. It is an advantage that cannot be too strongly urged, that the architectural student should be trained in an architectural atmosphere, that he should have every opportunity of associating with kindred spirits and forming lasting friendships with them. The true spirit of comradeship will be best promoted by such intercourse, and the higher claims of art will be more easily attained. If we would seek to stimulate the enthusiasm and fire the imagination of our fellow students, we must cultivate the love of the beautiful; we must continually strive for the advancement of our art, our sympathies and powers must be directed to raising the standard of our attainments and keeping a high ideal ever before us. Let us go forward, therefore, with renewed energy to the duties and studies of another year, remembering that the opportunities, the advantages and the privileges which are now the inheritance of our students have been obtained by the cordial co-operation, the self-sacrifice, the patient toil and the brotherly love of men who, for fifty years, have joined hands in promoting the advancement of architectural education and upholding the first principles and honoured traditions of the Architectural Association.

Mr. Cole A. Adams proposed a vote of thanks to the President for his comprehensive and interesting address on the fifty years' work of the Association. The falling off of the number of students in Division II. as compared with Division I. was a problem to be inquired into, and perhaps the only way to find the reason of it was to make individual inquiries. It was unwise to spend much time mastering the details of the manual arts—life was too short—but more time should be devoted to cultivating the imagination.

Mr. Beresford Pite, in seconding the vote, alluded to the healthy condition of the Association, which was perhaps due to the strong tincture of the practical with all their theories. The falling off in the numbers for the second division was a good sign. It showed that students after spending a reasonable time, perhaps three years, at the lectures and reading, went into the more serious part of their studies seeing much and remembering the great value of imagination.

Mr. Owen Fleming supported the vote, and the President briefly replied.

EXAMINATIONS IN ARCHITECTURE.

THE Directory of the Science and Art Department just published contains the following syllabus of the examinations in architecture:—

I.—The orders Greek and Roman.

The word "order" as applied to architecture. Its meaning as a combination of a column and its usual superstructure, or entablature. This combination, almost the only means of producing architectural effect employed by the Greeks, and the chief feature of Roman architecture. The term order as possessing also a wider significance and extended to denote a style or manner in keeping with one of the varieties of column in use in classic times.

The Greeks' use of the orders Doric, Ionic and Corinthian. The Romans' addition of two others, namely, Tuscan and Composite, so raising the number of orders to five.

Candidates are expected to make themselves familiar with the forms and general proportions of good examples of the orders—both Greek and Roman—so as to be able to draw them from memory with correctness, but it is not required that the dimensions of the minute subdivisions of height and projection which are met with in the books on the subject should be committed to memory.

II.—Mouldings made use of with each order; the capital considered as the index to each; the enrichments applied to the various mouldings; and the ornaments customarily made use of.

Candidates must be prepared to draw some of these from memory.

III.—Sources from which the orders were derived. Rudimentary and somewhat archaic forms in which they appear in early Greek work. The mode in which they were employed by Greek architects and by the Romans, including the way in which the latter combined arches with columns, and employed pedestals, thus variously extending the scope of the orders. The use made of the orders by Renaissance architects and the variations introduced.

From the first the attention of the student should be directed to the points of distinction as well as of resemblance between the Greek and Roman orders, extending to the mouldings, enrichments and ornaments, as well as the leading forms and proportions; and to the wide difference in architectural character thus created.

IV.—General knowledge. Terms in ordinary use in architectural books.

Candidates will be required to illustrate their answers under this head by sketches.

V.—Buildings of architectural character—Renaissance, Mediæval or Modern.

Candidates will be required to answer questions about buildings with which they are familiar, and the styles in which they are built, and will be asked to draw them or parts of them from memory.

Candidates cannot be too strongly impressed that architecture consists of buildings, not of representations of them; and that making studies of good specimens of architecture from buildings, or in the case of ornaments, &c., from casts, is the best way of obtaining proficiency in architecture. Such studies are often more instructive if drawn geometrically and to scale than if attempted in perspective.

Accuracy, combined with freedom, in draughtsmanship will always be taken into account in adjudging marks, and a thorough appreciation of the character of any object represented is of equal importance with the exact reproduction of the main proportions and prominent forms.

Candidates desiring to obtain a second class must be prepared to draw from memory, to scale, and with fair correctness, any of the orders, Greek or Roman; and to a larger scale, portions of the mouldings, enrichments, capitals or other features; and to answer questions on the architectural terms in general use.

Candidates desiring to obtain a first class must be able to do the work indicated above as required for the second class, but with more precision and completeness; they must also be prepared in some of the other branches of study indicated above, though not necessarily in all of them; and their draughtsmanship must be of good quality.

Candidates will be required to design a building, or some portion of a building, in conformity with a statement of requirements, or upon a sketch plan furnished to them and to carry out its architectural treatment in some definite style.

The object of the examinations is to show that the candidate possesses a competent knowledge of the decorative features and ornaments employed in some one style of architecture, such as Classic, Renaissance, Gothic, &c., and the ability to use them. Any style to which the above description will apply may be selected.

I. In planning a building, or in revising the plan of one, the masses must be thrown into such a shape as will admit of a satisfactory treatment of the exterior; and both the plan and section must secure that the interior (or each part of it, if it be

cut up into halls or rooms, &c.) be of good proportions and capable of satisfactory decoration.

Attention to these conditions must be combined with due attention to carrying out the statement of requirements, and to arranging for good access, lighting and general convenience.

2. A good balance of openings and solids and good proportions are essential to a successful design; and when the general lines have been settled, appropriate architectural decoration must be added. This does not simply mean ornament, it implies a familiarity with and the ability properly to introduce all that goes to make up architecture.

For example, in a Classic design the candidate must be able to introduce suitable rustication, the orders, possibly a dome, and the usual treatment of openings, cornices, balustrades, panels, &c., with their appropriate mouldings, enrichments and ornaments.

If the style be Gothic the candidate must show that he is familiar with, and can correctly employ, arches, buttresses, vaults, high roofs, dormers, tracery, carving, &c., such as were in use at the period which he selects.

Sufficient and correct knowledge of at least one style; draughtsmanship which, while exact and true, shall yet be free and spirited; and a little skill in the putting together of the parts of a design, such as is best acquired by practice and by study of existing buildings of good architecture, are the qualifications essential to success in this examination. The degree in which these qualifications are shown in the design will determine what award shall be made for the candidate's work.

TOMBS OF HUNGARIAN KINGS.

A CORRESPONDENT of the *Manchester Guardian* writes:—Being interested in the accounts which have been telegraphed to the English papers by foreign correspondents from Vienna, I took the opportunity during a recent holiday in Hungary of paying a visit to Széker-Féhervár (Stuhlweissenburg) to try and glean further information. I was fortunate in meeting with Dr. Hubert Szalay, a young Magyar priest acting as secretary to the Bishop, and he courteously put his time and knowledge at my disposal. To the main facts of the indictment against the town authorities he did not demur, there being no gainsaying the fact that a great act of vandalism has been perpetrated, but he seemed anxious to impress upon me that it was not the dignitaries of the Church who were to blame. When the old cathedral was destroyed by the Turks in 1543, the sarcophagi of the kings of the line of Arpád had been mostly removed to a vault in the garden of the Bishop's palace just across the road. These sarcophagi were examined by the archaeologist Henzelmann in 1869, and the contents, after being carefully labelled, were stored in cases in the loft of the town hall, under the care of the Mayor. In 1872 the then Mayor found them and had them placed in the vaults of the cathedral, one of the deans being made responsible for them. He, however, seems to have left them entirely under the charge of a drunken sexton and not to have troubled himself about them. In 1893 Professor Török received permission to take the bones to Buda-Pesth for his anthropological studies, and it was then found that the seals had been torn from the boxes and that they had been opened, several skulls being missing. The sexton on being questioned said that his predecessor, who is now dead, had informed him that a medical student named Tuzkay had come with a permit from the dean to take some of the skeletons for his medical studies, and that he had helped himself liberally. This student, who is now a respected doctor at Buda-Pesth, entirely denies that he did anything of the sort. So much for what has appeared in the press. Now Dr. Szalay objects to the statement that one of the deans was made responsible for the safe-keeping of the bones on their removal to the cathedral, and he further said that the present dean did not give permission to any medical student to help himself. With regard to the charge against Tuzkay, he seemed to think that it was a case of the sexton's word against the doctor's, and that as the former was now dead it would be difficult to arrive at the true facts. As regards the Royal remains, he said that not more than fifteen kings were buried there, and that Matthew Corvinus and Louis the Great were not among the number, their tombs being at Klausenburg in Transylvania. He further hinted that the list of kings given in the press reports must be received with caution, as they really had no definite data as to which of the kings were interred there. So much for this question, on which it is clear that further evidence is required before the stigma of carelessness and apathy can be considered to attach to anyone in particular.

Passing from this matter of doubt and recrimination, it may be said that to the archaeologist a visit to Széker-Féhervár, the Alba Regia of the Romans, is full of varied interest. Numerous inscriptions taken from the old cathedral have found a resting-place in the walls of the Bishop's garden, where they may be

studied, side by side with many Roman antiquities which, it is pleasant to say, have been carefully preserved. Again, the present cathedral, erected by Maria Theresa, contains in the recesses of its Reliquenschatz the scalp of St. Stephen, first Christian king of the Arpad line, enclosed in a glazed brass helmet. Another such helmet bears the inscription "Regis Hungaria caput S. Stephani." Other relics of this king are to be seen at Buda and Esztergom (Gran), the seat of the Primate, who, by the way, enjoys an income of about 60,000*l.* a year. The council chamber of the town hall, reached by an exterior wooden staircase, contains some pictures and further relics of the early days of Hungary. Altogether the visitor to the glories of Buda-Pesth will, if he be of an antiquarian turn of mind, find much to repay him in a visit to this quiet country town.

TESSERÆ.

Italian Memorials.

THE chief object in a commemorative monument is durability, and that it should make known for the longest possible period the object for which it was executed. This can only be done through the medium of inscriptions, and in that case inlay of marble is far more durable than engraved letters, which soon become defaced or filled up with the accumulated dust and dirt of years; indeed, nothing but wanton violence can destroy letters and ornament formed by flat inlay. A great number of memorial slabs of this description in the churches of Santa Croce and Santa Maria Novella at Florence have been walked over by the feet of many generations, and are as perfect as when first executed, whilst raised bronze is gone. The interest attached to these memorials is rendered doubly great by the addition of sculpture, and the effigy of the deceased lying within a framework of inlay ornament and inscriptions characterises a great number of monuments during the fourteenth and fifteenth centuries. These, executed in marble or bronze and let into the pavement of the churches above-mentioned, have been sadly worn by the feet of the living, and are generally so much defaced as to render them almost useless; nevertheless, the principle is excellent, and in the chapels attached to our great cemeteries monumental figures in bas-relief of this description, surrounded by an iron railing, would form most appropriate adjuncts. The expense of this method as far as material is concerned would not be great, as our own country affords sufficient resources for such purposes, and workmen would be more difficult to be found than marble. The church of Santa Croce is especially rich in examples of this combination of sculpture and inlay, and, were not the effigies so worn away by the feet of devotees, would form a most interesting series of costumes of laymen, priests, warriors and ladies.

Sir John Vanbrugh.

The value of a painter's opinion in regard to architecture is sufficiently apparent from what that of Reynolds has done for Vanbrugh. But for the honourable testimony borne to his peculiar merits by Sir Joshua, the name of that Sir John might still have had attached to it the ridicule endeavoured to be affixed to it by the puny wits of his day—or rather by the puny witticisms which, in their utter ignorance of art, they levelled against him, seeing as they did no other quality in his buildings but that of heaviness. That Vanbrugh was exceedingly careless and faulty in his details, sometimes coarse even to slovenliness, is not to be denied; still, he showed himself to be a master in picturesque composition, especially if compared in that respect with his contemporaries. To unqualified praise he is assuredly not entitled, but assuredly also it is not difficult to discriminate between his defects and his merits—not difficult to avoid the former, although not so easy, perhaps, to rival the latter.

Exiled Art.

The great art of a nation or the great work of a master can only be fully known and valued when seen in its own country or its native place. Carried elsewhere or disunited from its proper adjuncts it is always deteriorated. The calm, glowing sunlight of Egypt gives to the vast figures in *bassi-relievi* a softness and beauty they could not receive elsewhere. They are like gigantic *camei* and as delicate and as lovely. The sharpness, cleanness and warmth of tint also bestowed by the wondrous atmosphere of Egypt completely change the character of these ancient works from what they receive in our gloomy land and gloomier British Museum. In the same way pictures dissevered, like the Madonna di San Sisto at Dresden, from the architectural and sacred adjuncts amid which they were designed to be placed, are by that much diminished in effect and injured as compositions. Nothing but a visit, not even a plaster cast well placed, can give an idea of Michel Angelo's statue of Lorenzo de' Medici in the chapel at Florence; it wants its surroundings in the grand and gloomy mausoleum with the light playing on it, as its creator designed it to be placed. Museums and picture-galleries are too often wearisome collections of *disjecta membra*, contradicting and clashing with each

other, and the moderns have not scrupled to destroy in forming them much that the ancients would have revered and willingly have gone a long pilgrimage to see.

The Royal College of Art.

SIR,—Since an institution with which I have been connected for many years has been very unfairly attacked, and since your readers are just those for whose opinions we should most care, may I hope that you may find a corner in your valuable space for a few words of defence. A cutting from the *St. James's Gazette* has been sent me in which, after complimenting the Birmingham, Glasgow and Manchester schools on their high honours in the national competition, the writer continues:—"South Kensington lags far behind, with but eight medals against Glasgow's thirty-four and Birmingham's twenty-three." Where the journalist obtained his information from I cannot say, although I can recognise that it is a kind of which a good deal is printed.

The official report, however, is as follows:—

	Gold Medals.	Silver Medals.	Bronze Medals.	Books
Birmingham	3	3	16	33
Glasgow	3	8	23	23
Manchester	—	3	13	20
Royal College of Art, South Kensington	4	25	86	110

Otherwise, the R.C.A. has 225 awards, while the aggregate of the three selected schools has 148.

In conclusion, I would add that of the much coveted British Institution scholarships of 50*l.* per annum for two years, in 1895 the R.C.A. won four out of five offered, in 1896 the R.C.A. won two out of five offered, and in 1897 five out of seven offered. In other words, the R.C.A. has won eleven of these prizes in competition against all the art schools throughout the kingdom, including the Royal Academy Schools, leaving only six to be shared among all the others.—Yours faithfully,

E. S. BURCHETT.

GENERAL.

Mr. F. C. Penrose, M.A., having resigned his position as architect and surveyor to St. Paul's Cathedral, after holding the office for a period of thirty-four years, the Dean and Chapter of the Cathedral have appointed Mr. Somers Clarke, F.S.A., to succeed him.

A New Church for Seamen is to be erected at Poplar from the designs of Sir A. Blomfield & Sons.

A Pulpit in the form of a horse-block now stands, surrounded by a rail, in front of a Wesleyan chapel, at Wednesbury. The founder of Methodism preached no less than forty-five sermons from it. In his time it stood by the side of a building in one of the open spaces of that town.

M. Gustave Maincent, a French painter who only lately obtained the recognition he merited, has died suddenly in a railway carriage on the line near Croissy.

The Prix Chaudesaigues of 2,000 francs has been awarded by the Académie des Beaux-Arts to M. Léon Jousely, for his design for a theatre which would be specially employed for matinées.

The Exhibition of the Institute of Painters in Oil-Colours will be opened next week.

A Statistical Return lately published shows that in Germany many women take part in building operations. Among them are 309 masons, 2,000 workers in marble and slate, and 53 roofers.

A Third Version of the *Vierge aux Rochers*, by L. da Vinci, has been sold in Paris, which in some parts is considered to be superior to the painting in the Louvre.

Messrs. Wood & Hutchings have been instructed to prepare plans and to obtain tenders for the Sutherland Institute, Longton.

The Société de Monte-Carlo have employed the new Denayrouze light for the illumination of their buildings and grounds.

M. Maurice Lobre, the painter, has been nominated Chevalier of the Legion of Honour, as a reward of the services rendered to French art in Russia.

The First Ordinary General Meeting of the Surveyors' Institution of the session 1897-98 will be held on Monday, November 8, 1897, when the president, Mr. Christopher Oakley, will deliver an opening address.

A Special Meeting of the Liverpool Architectural Society will be held at the Law Library, Union Court, on Monday next, October 18, at 6 P.M.

The Architect.

THE WEEK.

ON December 2, the two-hundredth anniversary of the opening of the existing St. Paul's Cathedral will be commemorated by a Masonic service. The Grand Master (the PRINCE OF WALES), who will be represented at the ceremony, has granted the necessary permission, and invitations will be sent to all the lodges in and near London. Opportunities will be also given to all lodges in the United Kingdom that desire to be represented. Tickets will be issued only to members of the craft. The Bishop of LONDON has promised to preach the sermon. There is a tradition that Sir CHRISTOPHER WREN was Master of the Lodge of Antiquity, the oldest Masonic lodge in England, which used to meet at a hostelry in the churchyard during the building of the Cathedral. It is believed also that most of the workmen were Freemasons. According to the late Dean MILMAN, the opening of the new building on December 2, 1697, was a glorious day for London, especially a glorious day for COMPTON, Bishop of London, and he might have added for the architect and his subordinates. It had been proposed that King WILLIAM III. should in person attend this ceremony. He was himself anxious to be present. But it was said that at least 300,000 jubilant people from all quarters would so throng the Metropolis that the King could only with extreme difficulty make his way to the cathedral. The City authorities appeared in all their state and pomp. Bishop COMPTON took his seat on his throne, that throne, with the whole of the choir, rich with the exquisite carvings of GRINLING GIBBON'S. For the first time the new organ pealed out its glorious volume of sound. The Bishop preached the thanksgiving sermon. He took for his text that noble song, "I was glad when they said unto me, Let us go up into the house of the LORD."

LORD HERSCHELL'S speech at the opening of the Reading Art Gallery demonstrated that skill in drawing is not necessary for a successful lawyer, and without it a man can become Lord Chancellor. He said that he did indeed try earnestly when he was a boy to draw, but the result did not encourage any further efforts in that direction. The performance was of the most extreme description of Impressionism. He believed he created the impression that he intended to depict a man and a house, but beyond that everything was left to the imagination. But he had found that it was possible, without being an artist and able to create works of art, to be a thorough lover of art. That conclusion will be gratifying to many who have no aspirations towards the woolsock or the presidentship of the Royal Academy.

THE annual report of the Glasgow Institute of Architects, which was read at the meeting on Tuesday, stated that further communications had been received from the Master Plasterers' and Master Glaziers' Associations regarding a proposed revision of the rules of measurement recently prepared, but the Council had not seen any reason to alter the opinion expressed in last year's report that the proposed revision should be deferred for a time. The Council still considered that, however the rules might be modified or amended in the future, it must still be left to architects and measurers to apply them intelligently and to adapt them to changing conditions, and to the varying requirements of different buildings. It was reported that the Corporation of Sheffield had appointed a jury of three members of the Sheffield Society of Architects as assessors to prepare the conditions and adjudicate upon the designs submitted in competition for a public building in that city. The Council trusted that this example would be followed by other important Corporations. In the triennial competition for the travelling studentship prize of 60*l.*, the successful competitor was Mr. GEORGE A. PATERSON, Edina Cottage, Dalmauir. The Council had appointed a committee to consider and report as to a curriculum of architectural education for architectural students. The Council

had been invited to appoint two delegates to attend a meeting called for the purpose of considering the formation of a Scottish Architectural Institute. While the Council felt that in view of the non-success of a former institute of this kind, the proposal was of doubtful expediency, they agreed to appoint delegates to attend the meeting, and the matter was still further discussed by delegates of the four principal societies. The following Council was elected:—Messrs. T. L. WATSON, ALEXANDER PETRIE, JOHN B. WILSON, JAMES M. MONRO, JOHN JAMES BURNET, JAMES A. MORRIS, DAVID BARCLAY, ALEXANDER M'GIBBON, CAMPBELL DOUGLAS, W. FORREST SALMON, A. N. PATERSON, JOHN KEPPIE, H. K. BROMHEAD, JAMES LINDSAY and JOHN L. MURRAY. There are now sixty-six ordinary and nine honorary members of the Institute.

IT is remarkable that no arrangement appears to be feasible in any place in this country to prevent the waste of money which is inevitable whenever a gas or water pipe has to be laid down. When Southwark Street was constructed there was a subway for pipes, but there was no power to compel the companies to make use of it. There was a fear that the Metropolitan Board might seize the pipes. Accordingly the street was scarcely opened when the roadway, which was laid with as much care as an ashlar wall, was torn open to admit pipes. New streets in the Metropolis could not be treated with more indifference by gas and water companies if they resembled the American corduroy roads. But London was for a long period disorganised. That excuse cannot be offered in Edinburgh, where the Corporation, the water trust and the gas commission are at loggerheads as if they were rival companies and at war. A rational arrangement between them is now proposed. It is suggested that whenever the streets and buildings committee of the Corporation intend to take up the surface of a street a request will be sent to the Trust and Commission requesting them to take advantage of the opportunity to overhaul their pipes. On the other hand, the Trust and Commission are expected to inform the streets committee of any contemplated pipe-laying in order that repairs or alterations of the surface should be undertaken. It is not yet settled whether the parties can agree to avoid weakening the streets, for it is well known to paviors that every alteration has an ill effect upon surfaces in which stone is employed. In London repeated efforts were made to bring about a similar co-operation, but without much success. In Edinburgh common sense may, however, prevail.

THE fortieth annual report of the National Portrait Gallery announces that during the past year sixteen portraits have been presented to the Gallery. Among them are John Curwen, painted by William Gush; Sir Henry Holland, M.D., F.R.S., marble bust sculptured by W. Theed; Sir Henry Halford, M.D., painted in 1811 by Sir W. Beechey; Sir John Banks, painter unknown; Sir Richard Francis Burton, painted by Lord Leighton; Sir William Maynard Gomm, painted by James Bowles; Dean Stanley, a miniature; William Morris, painted by G. F. Watts; Coventry K. D. Patmore, painted by J. S. Sargent; Dr. Colenso, painted by Samuel Sedley; Richard Jefferies, a bust in plaster; Thomas Stothard, R.A., by John Flaxman; and Joseph Hume, by C. B. Leighton. Thirty-one portraits were purchased, including William Pitt, first Earl of Chatham, painted by William Hoare, R.A., and Thomas Flatman, painted by Sir Peter Lely; with twelve works by the late George Richmond, R.A., selected and purchased by the trustees from his executors for 100*l.*, namely, Samuel Wilberforce, Rowland, first Viscount Hill, Charles Thomas Longley, D.D., Charles, Earl Canning, John Ruskin, Edward Bouverie Pusey, D.D., Henry Parry Liddon, D.D., Sir George Gilbert Scott, R.A., Sir Robert Harry Inglis, Sir George Cornwall Lewis, Sir Charles Lyell, Cardinal John Henry Newman, D.D., James Bradley, D.D., and David Cox. As there are now 1,085 portraits in the rooms the report says that in a very short time the want of additional room will be still more severely felt, as there are numerous gaps in the historical collection which it is desirable to fill up, and the supply of personages of historical importance in the present or the future does not as yet show any signs of diminution.

THE GREEK COLOUR-SENSE.

BY A CORRESPONDENT.

ACCORDING to the doctrine of the evolutionists, man is a less imperfect animal now than he was at a remote period. Evidence of various sorts is forthcoming in support of that belief. The anatomist, for instance, holds that the bony structure of prehistoric man, as far as can be judged by occasional remains, was more nearly allied to inferior animals than is the structure of modern "subjects." The relative delicacy of the human organs is less easily determined, but as far as can be judged there was a time when not only were the organs of speech incapable of uttering more than a few sounds, but the powers of sight, of hearing, and of smelling were also more limited than among living men. It is needless to say that the amount of proof of these assertions cannot be of the kind which would be necessary to satisfy a jury in a modern law case. If a witness in a trial were to say he was competent to distinguish between colours, it would be easy to test his vision by the process adopted by the Board of Trade when examining sea-captains. His competence to judge musical compositions or perfumes would not be so readily determined; but much could be done towards determining whether the witness was an exception to ordinary men. We cannot judge the powers of the former inhabitants of our world with so much precision. It is well known also that the possession of a delicacy of sense is not enduring, for tea-tasters and judges of wine can be efficient for only a limited number of years, and experts in perfumes have a more brief tenure of power. They are the victims of excess, but there are many causes besides which affect the uniformity of sensibility on the organs of sense. A man who was born colour-blind, or another who became blind through over-study, would not be considered as evidence that optical weakness was universal. In fact, it was only at a recent period that the world became convinced of the prevalence of short-sightedness and colour-blindness. Many a man still living is able to recall punishments which were inflicted on him at school for inattention to explanations of diagrams which he was unable to see, and it is well known that fatal accidents have occurred through unconscious incompetence to distinguish between red and green flags or lamps. For many hundreds of years it was assumed that everybody could see clearly and perceive all varieties of colour. Descriptive writers at all times may therefore be assumed to have taken the average man as their model. WORDSWORTH, for example, was prone to talk freely about himself in his poems, but nobody would imagine from what he says so frequently about the delight offered by flowers that he was deprived of the sense of smell. He suppressed his individual weakness. When, therefore, we find earlier poets and writers expressing themselves in a way which to later knowledge suggests deficiencies, we are not justified in concluding that they were speaking or writing about things as they appeared to a few of their contemporaries alone. They stood for the majority and are to be taken as accurate, although there might be a minority to whom nature was more liberal and to whom their words were not applicable. If, for example, there is nothing said about perfumes as an element in religious services in the oldest Indian ritual, the Rig-Veda, and in the ancient books of other Eastern peoples, whilst they are supposed to be indispensable in more modern rituals of the same races, it is reasonable to conclude that in so remote a period priests and people resembled the English poet, and as a rose under any name did not smell sweetly for them, they could not imagine it would give pleasure to their gods. Or let us take another case. Anyone who listened to a lecture on ancient Greek music, or who heard one of the lately discovered pieces performed, would not believe that the Greeks were far removed from the savage state unless he was acquainted with their history, their architecture and their sculpture. The Greek ear was apparently less sensible or less developed than the Greek eye.

But exquisite as was the perception of form among the Greeks, it is doubtful whether they were as susceptible of differences in colour. The world has a belief in the infallibility of their artists, and consequently much ingenuity has been exercised to soften down the impressions which naturally are made by many descriptions of their chromatic

experiments in sculpture and architecture, as in painting. We are shocked when we read of gods and goddesses with vermilion or cinnabar faces, of beautiful marble columns painted in glaring colours, of paintings with the strangest contrasts. But if we can believe that their colour-sense was most limited if compared with the capabilities of living Europeans, then their obtuseness of sense will not appear so extraordinary.

There is one scale which can be applied to measure the degree of keenness of Greek sight, viz. the rainbow. All the references to it agree in suggesting fewer colours than are now visible. According to one fragment of XENOPHANES the bow is a cloud of purple, red and yellowish green. ARISTOTLE, whose powers of observation were extraordinary, also speaks of it as tricoloured, but the colours according to him were red, green and violet. He adds that sometimes yellow was visible between the red and the green, but explained the phenomenon as if it were one of the fallacies of the senses. The clouds around being dark, he supposed that the red from being in proximity to the green appeared as a lighter tint, and might even be taken for white; if the sky were not sombre there was no deception. It is remarkable that the theory of the Greek physicist should correspond with the belief of the tribes of the North, to whom the rainbow was a bridge in which materials of these colours were employed.

It is doubtful whether red, green and yellow expressed to the Greek mind similar ideas to those which are now connected with the words. In modern German *roth* or red is a generic term, which can stand for a variety of tints, and as for *grün*, it can signify rawness and freshness. The Greeks utilised colour terms with more economy. Some believed there were four principal colours, viz. white, black, red and yellow. But it is doubtful in what way green, which nature spreads so lavishly, was regarded. "Chloros" seemed to be a word that could be made generally applicable so long as it was not used to suggest a field. In the single case where it appears in HOMER in connection with ground, it is supposed to mean a sort of yellow, for it was likewise applied by him to honey, and to men's faces when they were overcome with fear. The "green and yellow melancholy" of VIOLA in "Twelfth Night" would suit the word. The Greeks, moreover, applied it to steel, sand, white wine and so forth. Less vagueness was attached to the word in the time of ARISTOTLE, for the philosopher confines it to the delicate or immature green which is found in plants in spring and to the faded greens of autumn. Some translators of his works render it by the compound "greenish-yellow." At a later period chloros signified a complete green, and became a designation of plants and herbs. The differences in signification are hardly to be explained, unless on the supposition that the eyes of the Greeks in the course of time had undergone some change, and colours were in consequence less hazy.

Dark green, *prasinos*, was another colour which was used to characterise things in common with vegetation which in our time are not described as green. Blue *glaukos* was applied indifferently to a host of greys and blues, while *kuaneos*, which also meant blue, was used alike for human hair and mourning robes. There are physiologists who are surprised by the want of definiteness in the employment of colour terms by men who were generally precise in language. They have explained the peculiarity by supposing that the material world appeared to the Greeks as a mass of lights and shadows, or let us say symphonies in greys, browns and whites, rather than as parti-coloured. An artist in black and white would therefore be able to render a scene as satisfactorily to the Greek mind as TURNER himself. Whether Mr. WHISTLER would also succeed is not improbable.

It was perhaps owing to the difficulty of appreciating, if not of observing, the colours which nature spreads over the earth that there is no record of a Greek landscape painting. The artists were like the majority of their countrymen who did not employ paints. The poets also passed over the scenery amidst which their characters lived or merely made occasional allusions to it for the sake of effect. It was man they were ambitious to describe, and a wall erected by him, especially if the stones were well set, was of more importance in their eyes than the most picturesque hill from which the stone was derived. The animating of rivers, hills and

woods, and endowing them with voices and the power of thinking, is enough to suggest how all things were measured by a sort of human standard. Greek travellers were also as little impressed by foreign scenes as by their native place, and to judge from their description all the world formed a colourless region. So long, as it was fruitful a man need not be dissatisfied, and it was possible to brighten it by a troop in well-polished armour. Thus HOMER speaks of the light from arms flashing to heaven or striking the skies, words which reveal a general dulness in the place of assembly.

It is remarkable that a similar sense of monotony is suggested by writings far older than the "Iliad," viz. the Indian hymns. By instinct or ignorance, in the East as elsewhere, man appears to have looked to the sky for manifestations of extraordinary effects. But in the hymns, it appears, there is not a word which is evidence that to a sun-worshipper the sky appeared blue, or that the azure canopy "fretted with golden fires" impressed them with its grandeur. In Northern Europe the sky appeared to the poets as black, which is equivalent to saying it was colourless. According to some etymologists the German word *blau* originally stood for black. Enough passages could be quoted from Latin literature in proof that among the Romans it was not impossible to confound black and blue.

As we have already suggested, we are not able to consider the physical qualities of a past generation except, as it were, through a glass darkly. Two alternatives are placed before us. First, the men who made use of the names of colours in a loose way were either deficient in language, like some partly civilised people now living, or were colour-blind; or secondly, their eyes were less sensible to variations of colour. We cannot suppose that the earth and sky were different from what they now appear. The solution must, therefore, be sought in the observers. As the Greeks were not likely to allow themselves to be deficient in words to describe things which were worth naming we cannot ascribe the absence of allusions to colours to the poverty of their language. We are therefore compelled to suppose that the cause was either indifference to colour or the possession of vision better adapted to take general views than to observe the elements of colour which were combined in all created things. The Greeks could be almost as analytical as the men of a later time, and sometimes carried the process to extremes. In colour and colour alone their strength failed them. The eye can see, we are told, all that it brings the power to see; but whether with the Greeks it was mental or physiological power they were deprived of, or more probably both, is a question which for the present, at least, must be left to conjecture.

ELECTRIC TRAMWAYS.

By F. J. WARDEN-STEVENS, A.M.I.E.E.

(Continued from page 245.)

Open Conduit Systems.

THESE systems next claim attention, as many have been proposed, and they have been tried in England, on the Continent and in America, especially the latter.

The general principle is that of the third rail, which is in this case below the surface of the road, contact with it being made by means of a plough fixed to the car and passing through a slot in the road.

The chief difficulties which have to be contended with are undoubtedly those of insulation, the inaccessibility of the conductors making any fault exceedingly difficult to repair, and also the fact that the conduit becomes a drain for surface water in storms and a receptacle for dust, &c. in dry weather.

It will, I think, be sufficient here to give a description of one of the latest systems, the "Simplex," which has been brought out by an English company of high standing.

In most conduit systems the conductor has been fixed, the connector being flexible; in this one the connector is fixed to the car and the conductor is flexible, being merely supported on hooks which are insulated.

The conduit is quite a small one, being about 8 inches wide and 12 inches deep, and is placed under one of the

rails. The rail under which the conduit is placed consists of two ordinary double-flanged rails (not tramway rails), which are supported on iron brackets fixed into the conduits. There is a space between the two rails which serves for the slot in the roadway. Each insulated hook which supports the wire is placed in a box on the inside of the rail. This box enables each insulator to be examined, and there is nothing in the conduit between each box except the conductor. The conduit is made of concrete, and there is a connection to the surface-water drain at each insulator box. These latter are about 30 feet apart. The slot between the two rails is about 1 inch across at the top and $\frac{3}{4}$ of an inch at the bottom.

There is thus a conductor simply resting on a series of insulated hooks at distances apart of 30 feet on the straight, and more frequently at curves. The next and most essential point is the straining device which keeps the wire taut. This is arranged to take up any slack due to variations in temperature or other causes. The straining device is so arranged that, while it keeps the wires stretched, it also can be lifted by the collector as it passes the junction. Thus the conductor is kept continuous and flexible. The straining apparatus at points is rather different, as the conductor is discontinuous, one end being fixed at a level a little higher than the collector level. Thus the collector leaves the conductor at points, &c. As, however, there are two collectors the continuity is maintained, the foremost one again making contact with the conductor before the hinder one leaves it. The electrical continuity of the line is maintained by an insulated conductor laid in a separate conduit.

The collector is, as before mentioned, rigid, while the conductor is flexible. The working part of the collector is U-shaped, and the cable makes contact in it. The collector is about 12 inches long and is bevelled down at the ends. As it passes along the conductor is lifted from the insulated hooks and is dropped down again behind. The great advantages of this system are that every insulator is accessible; the collector is extremely simple; there is absolutely nothing between the boxes in the conduit except the conductor, and that this latter can be drawn out from the boxes and a fresh piece be drawn in at once if a breakage occurs.

The usual difficulties with mud and moisture are, of course, met with, but there is no doubt that the great simplicity of the arrangement would admit of this being overcome to a great extent by a brush or plough fixed to the collector, or by periodical flushing. There would be no danger in the latter case of affecting the insulation, as the insulators, being accessible, could be wiped if the moisture reached them.

There is an experimental line a quarter of a mile in length with points and gradients at work at Prescott, and the results are said to be excellent. The cost of constructing this track is said to be only half as much again as the ordinary horse tramway, and if this is the case it will have a great future in the places where overhead wires are prohibited. It would, in fact, be a very serious competitor to the accumulator system.

There are many other conduit systems in use, including the Holroyd-Smith at Blackpool, the Siemens and Halske, and the Thompson-Houston; but, generally speaking, they are very expensive to construct and unreliable in working. It may be mentioned that the Blackpool line is about to be converted to the trolley system. However, there is no doubt that these systems have not yet had their last trial, and the impression concerning them is somewhat similar to that in connection with accumulator traction, viz. that the demand is ahead of the supply, and for that reason the supply must be forthcoming sooner or later. Whether the fixed collector or the flexible will survive it is difficult to say.

Surface Contact or Closed Conduit Systems.—This branch of the subject has attracted more inventors, perhaps, than all the others together. The distinctive feature of this system is, as before mentioned, that there are neither overhead wires nor slots in the roadway. The conductor is buried in a closed conduit, contact being made with the car by surface studs, &c. As a general description has already been given, a description of a particular example may be of interest.

The Westinghouse is a system which, if it does not prove entirely successful in itself, will certainly give a very good idea of the requirements of closed conduit systems.

The only visible apparatus is the contact stud in the roadway between the rails, and these studs are connected to the main cables by means of wires buried in the ground, through automatic switches which are placed in boxes at the side of the track. In one form there are three contact studs arranged triangularly on the track, each being about 4 inches in diameter. The studs are made of wrought-iron, slightly rounded on the surface, being fitted into an earthenware block with connections laid in pipes from them to the boxes. Two of the studs are for the purpose of leading the current to and from the motor. The other one, the auxiliary, is for working the mechanism. The distance between each set of studs is about 13 or 14 feet, but of course this can be increased if the car is long. The action of the apparatus is as follows:—Underneath the car three iron bars are suspended, so that while they touch the surface of the studs they do not trail on the road. Each is a little longer than the distance between the studs. Now one of the bars touching the auxiliary stud causes a current to flow from a small storage battery in the car through the stud into the switchbox, where it passes round the shunt winding of an electromagnet, causing it to attract an armature. This connects one of the other two studs to the main wires, and enables the current to enter the car through the two collector-bars. This armature has on it a carbon contact which is brought into connection with another and similar one; the current passes from the positive cable through the armature and contacts to a series coil, which further strengthens the magnet when current is flowing, and renders any discontinuity of current impossible. The end of this coil is connected to the positive stud, and the negative stud is always connected to the negative main. In the other form the negative cable is connected to the rails, and in this case there are only the auxiliary and positive studs on the road.

When the bars leave the studs, both the series and shunt coils are rendered inactive and the armature falls, disconnecting the positive stud entirely.

The arrangement of the box is excellent, as regards insulation and prevention of moisture and dirt affecting the contacts, &c. The working parts are enclosed in a bell-shaped case which dips into an oil seal, thus effectually preventing the entrance of moisture or dust.

The great advantages of this system are that the apparatus is very positive in its action, all the apparatus can be easily inspected, the current cannot be switched on without the application of an auxiliary battery, which renders it very safe. The only danger is that the armature may not fall. This could easily be provided against, or at least its effect could, by having a trailing contact on the car which would ring a bell, or switch off the motor, or otherwise call attention if the pressure should by any means be left on the stud after it leaves the contact bar. This trailing contact could be connected to the negative contact bar, so that the main would be short-circuited and the contact be permanently disconnected by the blowing of a fuse if the above eventually occurred. If some such precaution were taken this system would be absolutely safe. The cost of this system is said to be much lower than that of other closed conduit systems, as there is really no conduit; the excavation needed is only a foot or so, and the cables may be buried direct in the ground.

Combination Systems.—There are, in addition to the systems already mentioned, cases where various combinations are used. The reason for such combinations is usually the fact that overhead wires are used in the suburbs and are not allowed in the town. Thus the combinations are nearly always those of overhead and other systems.

The useful combinations used, or suggested, up to the present are:—

1. Overhead and third rail.
2. Overhead and accumulator.
3. Overhead and surface contact.
4. Overhead and conduit.

The overhead and third rail has already been discussed in the case of the Bessbrook and Newry Tramway.

Overhead and Accumulator.—This combination has been used with great success in Hanover, where the municipal authorities refused to allow overhead wires. The accumulators are carried on the cars permanently,

charged by the current from the overhead wires in the suburbs, and discharged when the overhead wire is discontinued during the run through the town. At the beginning of 1897 the total mileage of track was 23·4 miles, of which 10·6 miles were worked by accumulators alone. The charging takes place over parts of the track, the length of which varies from $1\frac{1}{2}$ to $4\frac{1}{2}$ miles, the discharge being from 3 to 7 miles. The accumulators are placed under the seats, the cells numbering 208, the boxes being constructed of vulcanite, and the weight of the batteries is said to be $2\frac{1}{2}$ tons. The method of charging the cells appears to be as follows:—The cells are connected to the line first in two halves, paralleled, the current being regulated by means of a variable resistance. When the motor is to be driven from the battery the cells are put in series. Careful tests have been made of the running on this line, with the result that the efficiency of the battery was found to be 74 per cent., while the economy of the central station was found to have been very considerably increased. This latter result is due to the fact that on the trolley line the battery acts as an equaliser, keeping the current more even on the dynamos and keeping them working more economically. For instance, on mounting a gradient the energy which had been going into the cells goes to the motor, the total load being increased comparatively little. The amount of fuel used per car mile has been decreasing steadily as the ratio of "accumulator miles" to "trolley miles" has been increasing, thus practically proving that the system is more economical with than without the accumulators. The cost of maintenance of the battery appears to be very low (16*d.* per accumulator kilometre). The total cost per car kilometre works out at 6*d.* after allowing for interest, depreciation and attendance. It is also estimated that the total cost is less than $\frac{1}{4}$ *d.* per car kilometre above that if all the line were on the trolley system. This system has, it will be seen, been very successful and could no doubt be used with economy in England for towns having suburbs, &c. However, this system does not strike one as being the final one, especially as it is now stated that the system is about to be converted to accumulator traction altogether.

Other Combinations.—With regard to the combinations 3 and 4, the surface contact one presents no difficulties. When the end of the overhead wire is reached the trolley is clamped and the collector bars let down, and it would not be even necessary to stop the car. In the case of a conduit system more difficulty is met, owing to the fact that the plough must either be removed from the conduit or disconnected from the car. Either arrangement must cause some delay, which would be serious on a busy line. There is, however, no difficulty which is insurmountable.

Generally speaking, either of these two latter systems are preferable to accumulators when the gap to be bridged over between the trolley wires is short, as the cost of the accumulators would be too much, and the loss due to carrying the accumulators over a long distance of trolley line proportionally too much.

(To be continued.)

LIBRARY CONSTRUCTION.*

PEOPLE who patronise libraries, especially those which are public, expect to have enjoyment at the expense of others, and we are unable to imagine how a "Library Series" like Mr. ALLEN's can pay him. Copies may be obtained for the use of those to whom a library is a gratuitous club, but there are hardly enough public institutions of the kind in Britain to exhaust an edition. Mr. ALLEN, like some other publishers, probably imagines that when a volume of his series enters a library its merits will be recognised immediately, and everybody who sees it will hasten to purchase a copy. That is a delusion. A public or society's library might be defined as an obstacle to the sale of books, for it is well known that people who are not poor will spend days or weeks waiting for an opportunity to obtain a loan of a volume rather than pay a shilling or two for its possession.

* *Library Construction, Architecture, Fittings and Furniture.* By F. T. Burgoyne M.A. (London: George Allen.)

It is not our mission to take charge of the interests of publishers or booksellers, and how can an architect desire to see the series gain success if all the volumes are to be enriched with introductions resembling one which appears in the volume before us? The writer is Dr. RICHARD GARNETT, who edits the series. He is a gentleman of fine character, and there is nobody in England who is more influential as an authority on administration with librarians. But unfortunately Dr. GARNETT is not proof against the prejudices of the time, and, like experts in various professions, he does not value the co-operation of architects at the high rate it merits. Every one who is acquainted with architects knows that when designing libraries they are only too glad to have the help of specialists and of local specialists, for the arrangements which will suit one part of London may fail elsewhere in the Metropolis and become impracticable if introduced in a country town. Dr. GARNETT, however, considers an architect to be no more than a façade-maker who is employed because library committees and others are unwise. Here is one passage from the introduction:—

The same architect is equally ready to turn out a church, a library, a theatre, or a bank. It is inevitable that in the absence of special knowledge of and special devotion to a particular style of edifice, the sentiment of architectural display should gain the upper hand. Hence a continual conflict between the architect who desires a handsome elevation, and the librarian who aims at practical convenience, frequently determined by a committee endowed with no great feeling for either. Parodying a famous saying, it may be safely affirmed that this state of things will continue more or less until architects are librarians or librarians architects.

Dr. GARNETT is hardly the man to condemn the versatility which makes the designing of various buildings a possibility. He also lays claim to a like quality, for his name appears on the title pages of books on various subjects. It is not perhaps so difficult for an architect to design four or five kinds of buildings as for a *littérateur* to write verse and prose, translate, and lay down the law on art. But we need not apply the *tu quoque* in this case. It is more satisfactory to be able to state that Mr. BURGOYNE, the author of the book, does not take the same view of the aid given by architects as his editor. He tells us that Sir THOMAS DEANE & SONS carried out the librarian's arrangement of floors and book-cases in the National Library in Dublin. All he desires for the central library in Bristol, if one should ever be erected, is that the plans will be as successful as those of Mr. GOUGH's branch library. By Mr. HOSKINS's planning at Darlington the work of supervision is said to be materially reduced. As much is affirmed of Mr. ADAMS's library at Shepherd's Bush. The variety of plans which Mr. BURGOYNE introduces manifests at a glance the desire of the architects to avoid stereotyped arrangements, and to produce buildings which will be convenient to visitors and lighten the work of the officials. If objections are raised, as when buildings are too small, the architects cannot be considered as the culprits, but in not one case do we find Mr. BURGOYNE referring to a conflict between architects and librarians, or to any sacrifice of practical convenience to a handsome elevation. The descriptions, plans and other illustrations are the most effective refutation of Dr. GARNETT's allegations against architects.

Mr. BURGOYNE is the librarian of the Tate Library, Brixton, and has every day opportunities of considering an important problem. In the old days, as he says, the "librarian's chief duty was to preserve his books from assaults of would-be readers, instead of acting as a key to unlock the stores of his library." The ancient librarian could, however, with tolerable accuracy gauge the character of his enemies, but in the miscellaneous company that now invades a library there is a strange variety of readers. In some suburban libraries a party of householders will practically transform a reading-room into a private club, and outsiders can perceive they are not welcome. Borrowers of books for home reading are generally patient, but in districts where liveried footmen come from carriages outside it is expected that patronage will be rewarded by expedition and priority. There are libraries where borrowers can select the books they desire from the shelves; elsewhere a privilege of that sort would quickly diminish the stock. It is not easy to foresee how all interests are to be

met. Then, again, the accommodation for an increase of books cannot be based on any uniform calculation. Between 1875 and 1895 the stock in Birmingham increased from 57,081 to 155,633, but in Cardiff the increase was from 8,310 to 55,080. In Manchester 61,213 books were issued in 1875, while in 1895 the number was 416,100; in Liverpool the respective numbers were 517,393 and 619,259. In 1885 more books were issued in Liverpool than in 1890 or 1895. A librarian's temper must be often tried in endeavouring to meet the fluctuations, and it is no wonder if he sometimes grumbles at the inadequate space which the architect provides. A modern public library is one of those buildings which can never be perfect until elastic materials come into fashion, or they are so constructed as to be compressed or expanded at will.

Mr. BURGOYNE would have the site of a library as central as possible, but in a position where the noise of traffic should not distract the students. A corner site is preferred. The building should contain "a reference department, a lending department, a reading-room or rooms for newspapers and magazines, working rooms for librarian and staff, separate reading-rooms for boys, girls and women, an inner room for students, lecture-hall, museum and art gallery, residences for librarian and caretakers, strong-room, and rooms for binding and repairing." The public rooms are not to exceed two storeys in height unless there is a ventilator. A corner site with an area of 10,000 square feet will accommodate, says Mr. BURGOYNE, 150 readers of newspapers and magazines, a lending library of 50,000 volumes, a reference library of 150,000 with 100 readers, with offices for staff. No less important is the question of shelving. French and English ingenuity have produced most economical arrangements in metal, and TONKS's fittings obtain due praise. They are most effectual. Mr. COTGREAVE, of the West Ham Library, has devised numerous helps in the form of indicators, racks, steps, &c. But it would be vain to attempt to suggest the contents of Mr. BURGOYNE's volume in the compass of an article. His "Library Construction" will be found most suggestive to architects, and his descriptions become more clear by means of 140 illustrations, which are of a practical kind and are produced in excellent style. Altogether the book impresses the reader as the work of a man of business whose time is precious, and who believes that his readers resemble himself.

LISKEARD CHURCH TOWER

AT Liskeard Town Council on the 12th inst., Alderman Lang inquired what powers the Council possessed in dealing with dangerous buildings. As was well known, the tower of Liskeard Church was a source of great danger, and in his opinion there was no other way to deal with the structure than to remove it. Before very long, they might depend upon it, the tower would come down. What powers did the Council possess in the matter?

The Town Clerk (Mr. H. Lyde Caunter) thought if the tower was shown to be a source of danger to the public, the usual clauses of the Act of Parliament would apply, and the borough surveyor would have power, after due notice, to remove it. That was the law relating to ordinary buildings that were shown to be dangerous; he did not know whether the fact of the tower being an ecclesiastical building would make any difference.

Mr. Lang: I think the surveyor's attention should be called to the condition of the tower.

Mr. Husband said the subject was discussed at a meeting of the sanitary committee last week, and notice given to remove a dangerous stone on the top of the tower, forming one of the battlements, which might come down at any moment.

Mr. Henwood: It is a question whether the Town Council and not certain parties at Truro are not responsible for the safety of the public.

Mr. Lee believed notice had been given to a large number of seatholders at the west end of the church to remove for their own safety.

Mr. Husband thought it was deplorable that the present state of things should be allowed to exist, and although a vestry meeting had been called, it was right and proper the members of the Council should voice the feelings of the public. He called it a downright shame that the church people of Liskeard should not be allowed to manage their own business in their

own way. In the interests of the public, and especially as church people had been requested to remove their seats for their own safety in church, steps should be taken to remove the dangerous building.

Mr. Lee suggested whether a resolution sent to the Ecclesiastical Commissioners would not have some weight.

Mr. Henwood thought it was very much to be regretted that the people of Liskeard could no longer hear the lovely church bells.

Mr. Colmer failed to see why the tower should not be treated in the same way as the dangerous buildings belonging to private individuals.

The Mayor said before they could take steps in the matter the borough surveyor must certify the building to be dangerous to the public. The surveyor had inspected the tower, and the only part he reported dangerous was a stone on the top.

Mr. Husband: I propose the surveyor be asked to examine the tower and report.

Mr. Colmer: And pronounce it to be dangerous to the public safety.

The Mayor: You must leave the judgment with him. You must not be his "assessor."

Mr. Henwood: The tower has become more dangerous according to recent examinations.

Mr. White seconded Mr. Husband's motion, which was unanimously adopted.

The parishioners of Liskeard were on Thursday evening, the 14th inst., summoned by the vicar and churchwardens to a special vestry in the Guildhall, to receive the judgment of the Chancellor of Truro refusing to grant a faculty to take down and rebuild the tower of Liskeard parish church, the tower committee's report on the same, and to determine thereon. The vicar (Rev. J. Norris) presided, supported by the churchwardens.

The Vicar regretted the necessity of their meeting that night, and while confessing temporary failure and asking the parishioners what they would like him to do in the future, he felt pretty certain that the people of Liskeard would show the same spirit voiced in "Trelawny," where they sang that "Twenty thousand Cornishmen will know the reason why." It would be necessary to speak plainly, but, he hoped, soberly and with full moderation of the treatment they had received. In the first place, they invited a gentleman to come to Liskeard and make an examination of the tower of the church, and agreed to pay him seven guineas for his labours. He (the Vicar) knew nothing of his coming, and only knew, when too late, that he had come and gone. He gave them a very elaborate report and described the tower carefully and properly—they would give him all the praise they possibly could—but how Mr. Prynne came to his conclusions about the foundations, the nature of which he had never ascertained, he was at a loss to know. In the next place, they applied for a faculty, plans having been previously prepared (in accordance with the requirements published in the "Diocesan Kalendar") at an expense of about 80*l.*; the citation was duly published and no opposition was lodged, not even by the Society of Antiquaries or the Royal Institute of British Architects. The first letter from the Chancellor of the Diocese gave them an indication of what they might expect in the future. Mr. Prynne told them the tower was in a dangerous condition. Mr. Sedding corroborated that statement. The Chancellor made a mistake in one of his letters, in which he stated that Mr. Prynne said the tower must be taken down. Mr. Prynne never said anything of the kind. Mr. Prynne had been opposed all along to pulling down the tower. Mr. Sedding reported that the only conservative way of dealing with the tower was to take it down and rebuild it. On May 17 last the Chancellor wrote that if they would take down the present tower, and rebuild it precisely, he supposed, on the same lines, he would grant them a faculty. They could not carry out that scheme, although he candidly and fearlessly confessed that it was a wiser and better scheme than the one proposed by Mr. Prynne. Certainly no architect would have undertaken to carry out such a proposal as the Chancellor made, and besides it would have prevented their obtaining the 1,000*l.* left by Miss Pedler. That legacy—he was not going to shut his eyes to the fact—was a strong incentive and encouragement to the rebuilding of the tower. On May 24 again the Chancellor was prepared to grant a faculty for the pulling-down of the tower and rebuilding it, provided there was no departure from the general design of the present tower. That was a wiser decision than his previous suggestion to re-erect the present tower, and he (the Vicar) did not know whether they were quite wise in refusing that offer. He rather thought they were unwise. Certainly they had not the worldly wisdom, but it must be remembered they had another gentleman to deal with—the architect of the church, who rightly or wrongly deliberately stated that he would not, on any ground, reconstruct the tower or change it in any way. Therefore they could not deal with the question as, perhaps, some of them would have liked. Then came a deadlock. They could not see their way to fall in with the wishes of the Chan-

cellor, because they wanted the tower built according to Mr. Sansom's plans. The bishop and himself had several letters, and he dared say they crossed swords a little bit, for which he was very sorry; but he felt he must be honest and straightforward, and he told his lordship that his first interest was in, and his first duty towards Liskeard—that he must study the town in which he lived and the church of which he had charge. The bishop was exceedingly nice, and at his suggestion the archdeacon was called in and gave them his best counsel, advising the committee to ask the Chancellor to reopen the case with an assessor and expert of his own choice and selection. He told the archdeacon that he could not be a party to that, that he had no confidence in it, but he was willing to stand aside if the committee thought it the best course to pursue. The reins were taken up by the churchwardens, who did their best to steer the boat from the rocks and lead them safely into the haven. He asked the question, Was it fair, after the churchwardens had placed implicit confidence in the Chancellor and allowed him to select a gentleman to whom they agreed to pay twenty-seven guineas—was it fair he should have appointed a Fellow of the Society of Antiquaries? He did not think it was fair; he told the archdeacon and the bishop it was not fair. It was a most unfair thing to do. As to the Chancellor's judgment, it seemed to him that Mr. Paul, when he got to a certain point, found he had been writing everything for Liskeard and nothing against it, and that he had then quickly thrown overboard Mr. Sedding, Mr. Lang and others, and brought forward the statements of Mr. Ponting and Mr. Prynne, and so refused the faculty. But when he (the Vicar) was beaten he did not know it; if he got knocked down once he tried to get up and have another go. He was determined to fight to the last moment, and so far as he was concerned, there would be no repairing or patching up of the tower. The tower might stand as long as it could, or fall down as soon as it could, but he would be no party whatever to any patchy or botchy work for the repair of it at a cost of 800*l.* or 1,000*l.* The advice he had to give was that they put their shoulders to the wheel and promise to do what they could to raise the 2,000*l.* That was the safest way, he thought, to proceed. Let them have the promises of the money and go forward with the work. Let them notify the executors of Miss Pedler's will that they had raised 2,000*l.*, and if they found they could not go forward they would not require the money. The Vicar read the following encouraging letter received from Rev. G. E. Tate, of Widcombe Manor, Bath, senior member of the Simeon Trustees, the patrons of the living of Liskeard. It was dated October 13, as follows:—

"You have been very hardly dealt with at Liskeard and put to unnecessary expenses, which must cause in the parish considerable irritation. I entirely sympathise with you, and feel that the Chancellor has made a great mistake in refusing a faculty. However, you have done your best for the church along with the bulk of your parishioners, who have co-operated with you. I am truly sorry for them and for you, but you must not lose heart. It may yet be overruled for good. The Chancellor would evidently force you to restore the tower if he could, but if the present strong local feeling continue, he will find out his utter inability to do so."

The letter was received with applause. The vicar also read a reply he had sent to the Society of Architects, wherein he stated that the least the Society could have done was to have sent a gentleman to judge the merits or demerits of the tower without prejudice.

Mr. S. Bone proposed the first resolution:—"That this meeting of parishioners, in vestry assembled, has received the refusal of the Chancellor of the Diocese to grant a faculty for rebuilding the tower of the parish church with great sorrow and regret."

The resolution was carried unanimously.

Mr. W. Hammond moved, "That notice of appeal against the Chancellor's decision be lodged at once, and that a fund be started to cover the preliminary expenses and also any costs incurred by the committee for legal and other necessary purposes."

Mr. T. Peters seconded.

Mr. L. C. Foster proposed an amendment and said he was afraid he represented a minority of one. The Vicar had said he did not know when he was beaten—that when he was knocked down he got up and tried to hit again. That was not his feeling at all. He advocated a certain course at a previous vestry and was beaten. He then said he would do nothing to oppose, although he could not assist, and he and his family had loyally kept to the promise. His position was this. Miss Pedler in 1885 understood that the tower must come down, and she gave 1,000*l.* (provided another 2,000*l.* was raised) to pull it down and rebuild it. The vestry then set to work to get the money, applied for a faculty, and the law stepped in and said they must not do it. Therefore he thought they had very good ground for trying to set that portion of the will aside which said they must not apply the money in Liskeard for any other purpose. He proposed as an amendment, "That this vestry

instruct the churchwardens to approach the executors and trustees of the will of Miss Pedler, and those having an interest in the residue, with a view to obtaining legal power to use the legacy of 1,000*l.*, or some portion of it, towards the restoration of the tower, instead of rebuilding." Addressing the people, Mr. Foster said it was not necessary for them to hiss, as he was at liberty to have his opinion. He thought they had in Liskeard three pressing calls which they ought to respect before they gave themselves the luxury of a new tower. The parish got 60*l.* a year from a farm on which there was a cottage which one of the churchwardens, who was medical officer of health, said was unfit for habitation. They ought not to take 60*l.* a year from a farmer until that cottage was rebuilt. Another thing was that the churchyard should be enlarged, and they frequently heard that the money the Vicar received was not sufficient, and they might augment the living.

Mr. Husband seconded the amendment.

Mr. Borlase Childs defended the Chancellor of the Diocese, who was a personal friend of his, from any imputation. He did not conceive Mr. Paul had been influenced improperly by any living soul, least of all by a party at Truro. Mr. Paul was a man they could not buy. He was sorry for the mistake Mr. Paul had made as a friend, a man, a Cornishman, and a lawyer—because he was wrong in his law. Let them be fair all round. Mr. Paul had tried to do his duty and signally failed, but he gave him credit for good intentions. Mr. Foster had his esteem and regard, but he had wandered from the flock, and it was to be hoped he would see the error of his ways and come back again. He supported the motion, and reminded them that if they did not appeal the judgment of a court of law was against them, and he was distinctly of opinion that the 1,000*l.* was lost to Liskeard. Had a faculty been granted, they would have had no trouble in raising a sufficient sum to rebuild the tower. The court being against them, it seemed clear to him they could not claim the legacy, and the raising of 2,000*l.* was no good at all. He advised them, therefore, not to adopt Mr. Foster's amendment. In 1878 Mr. Foster appealed for funds for rebuilding the tower.

Mr. Foster: I wish you would speak to the amendment.

Mr. Childs: I cannot dissociate the amendment from yourself. When a gentleman shifts his position—

Mr. Foster: I have never shifted my position.

Mr. Childs: If not your position, you have shifted your ideas. In 1878 you asked for funds for rebuilding the tower.

Mr. Foster: Pardon me—

Mr. Childs: There are printed documents to prove it.

Mr. Foster: I signed the appeal as secretary of a committee. It was my duty to sign it, just as I signed the application for a faculty as a churchwarden.

Mr. Childs: Then come back and sign your name once more. I would not say one word to hurt your feelings, but the question before us is a public one. Continuing, Mr. Childs said they meant to build a new tower if they could. It had been said that they were dreadful fellows, desiring to tear the tower to pieces. He emphatically denied the allegation. They desired to carry out what Mr. Sedding had suggested, a scheme of conservative craftsmanship.

Only two voted for the amendment, and the motion was carried.

The tower committee were reappointed, with power to add to their number; and thanked for their past services.

PHOTOGRAPHY AND EXPLORATION.

A LECTURE was given on the 14th inst. by Professor Flinders Petrie at the Camera Club on "Photography, the Handmaid of Exploration," but the lecture was different and better than its title promised. There were three distinct interests in it—a photographic interest, an archaeological interest and a topographical interest. The simplicity of the Professor's apparatus and methods astonished members of the club. His camera is a home-made, tin-plate contrivance that can be dropped on rocks with impunity; his drop-shutter is made of pieces of milk tin and of blind lath, and he never troubles about a dark-room. Yet if members of the club were scandalised by the means they could not do other than rejoice over the results. Low desert hills covered with flints, enormous valleys without a green leaf, the swollen Nile, limestone plateaus 1,400 feet above the river and commanding a horizon fifty miles away, pleasant groves of young palms, bashful Egyptian girls, men with their eyes screwed up because of the sun—these and other things were thrown upon the screen amid the applause of an audience of experts. Every detail was sharply shown, thanks to the bright sunshine and the photographer's skill. He explained that the difficulty was to get plates that were "slow" enough. The most interesting part of the lecture was the part of it dealing with Professor Petrie's work as excavator, explorer and scholar. He displayed and described some of the many important discoveries he has made in Egypt during recent years.

Several statues were shown of which the date is 3500 B.C. Digging his way through a cemetery of 150 tombs, he came upon a basket, some wooden mallets and a chisel that one of the workmen had left behind. The astounding thing (to the audience) was that the basket, with pieces of palm rope attached, should have survived in an absolutely unimpaired condition since 3500 B.C. To the lecturer there was, however, nothing astounding in the circumstance. He as good as said that anything kept air-tight in dry sand would exist for ever. Photographs were shown of skeletons dating probably from 5000 B.C. There was no injury; the whole cage of ribs, in their original articulation, remained united to the spine. Among the Professor's "finds" were spoons and harpoons of ivory, possibly belonging to the pre-historic ancestors of the Egyptians; ivory combs, with animals carved at the apex, which the Egyptian ladies of long long ago must have found invaluable for keeping together their thick, brown, wavy hair (Professor Petrie has found some of that too); a death-mask from the capital of that king who worshipped the rays, as distinguished from the ball, of the sun; a marvellously beautiful piece of sculpture; a tablet, 1200 B.C., with a unique reference to the subjugation of the Israelites; and a papyrus version of part of the second book of the "Iliad," with marginal notes. What particularly struck some members of the club was the portion of a frieze showing two naked princesses attending a court function. The flesh had been done in ruddy brown, and white particles had been powdered on to indicate where the sunlight had caught the skin—the earliest known example of light and shade. "You will notice," said the lecturer, "that the elder girl has drawn up her knees with some dignity, and that she is chucking her little sister under the chin."

SMOKE-DUCTS IN ANCIENT HOUSES.

THOSE passages of the ancients which speak of smoke rising up from houses have with equal impropriety been supposed to allude to chimneys. Seneca says, "Last evening I had some friends with me, and on that account a stronger smoke was raised; not such a smoke, however, as bursts forth from the kitchens of the great and which alarms the watchmen, but such an one as signifies that guests have arrived." The true sense of these words undoubtedly is that the smoke forced its way through the kitchen windows. Had the houses been built with chimney funnels, there could be no cause for alarm; but as the kitchens had no convenience of that nature, an apprehension of fire when extraordinary entertainments were to be provided seems to have been well founded, and on such occasions people were stationed in the neighbourhood to be constantly on the watch to extinguish the flames in case a fire should happen. There are to be found in Roman authors many other passages of a similar kind. Aristophanes, in one of his comedies, introduces his old man, Polycleon, shut up in a chamber whence he endeavours to escape by the chimney. This passage may readily be explained, when we consider the illustration of the scholiasts, by a simple hole in the roof, as Reiske has supposed; and, indeed, this appears to be the more probable, as we find mention made of a top or covering with which the hole was closed. It has been said that the instances of chimneys remaining among the ruins of ancient buildings are few and that the rules given by Vitruvius for building them are obscure; but it appears that there exist no remains of ancient chimneys and that Vitruvius gives no rules, either obscure or perspicuous, for building what, in the modern acceptance of the word, deserves the name of a chimney. The ancient mason-work still to be found in Italy does not determine the question. Of the walls of towns, temples, amphitheatres, baths, aqueducts and bridges there are some, though very imperfect remains, in which chimneys cannot be expected; but of common dwelling-houses none are to be seen, except at Herculaneum, and there no traces of chimneys have yet been discovered. The paintings and pieces of sculpture which are preserved afford as little information, for nothing can be perceived in them which bears the smallest resemblance to a modern chimney. If there were no funnels in the houses of the ancients to carry off the smoke the directions given by Columella, to make kitchens so high that the roof should not catch fire, were of the utmost importance. An accident of the kind, which the author seems to have apprehended, had almost happened at Beneventum, when the landlord who entertained Mæcenas and his company was making a strong fire in order to get some birds the sooner roasted. Had there been chimneys in the Roman houses, Vitruvius certainly would not have failed to describe their construction, which is sometimes attended with considerable difficulties, and which is intimately connected with the regulation of the plan of the whole edifice. He does not, however, say a word on the subject; neither does Julius Pollux, who has collected with great care the Greek names of every part of a dwelling-house; and Grapaldus, who in later times made a collection of the Latin terms, has not given a Latin word expressive of a modern chimney.

NOTES AND COMMENTS.

THERE are fewer pictures than usual in the exhibition of the Institute of Painters in Oil-Colours, but the attractiveness is not thereby diminished. The four hundred and five works can be seen without discomfort, and that is an advantage. The President's *Rest* appears to be another of his costume portraits. The woman wears conventional robes, which allow the nude arms and feet to be seen, but, unlike her predecessors, she is seated beside a river that resembles one of the upper reaches of the Thames. As usual, every part is worked out with much deliberation. Mr. G. F. WATTS is one of the honorary members of the Institute, and he contributes this year *A Study*, which is valued at 630*l.*, a sum that appears stupendous to frequenters of the gallery. It is a portrait of a girl in red, and the background is also red. It is vigorously painted, but will hardly rank as one of the great works of the master. There are some ambitious figure pieces. Mr. KENNINGTON, in his *Cephalus and Procris*, has taken a hint from the history of Greek art. The grief of AGAMEMNON, it is said, was concealed in the old picture by a veil, and we are unable to realise the wonderful beauty of CEPHALUS, of whom AURORA was enamoured, for his face is completely hidden. The Greek princess appears to be sleeping rather than slain by her lover's arrow. But with all shortcomings the picture attains the highest standard reached by the artist. M. FANTIN LATOUR has a *Diana*. The goddess is reposing in a wood, and is of an English type. *Fortune's Favourite*, by Mr. LOMAX, is a gambling scene in which a youth is winner, and it tells its story without any straining after effect. Mr. MORGAN'S *Jack Ashore* shows the British tar with children. Mr. STOCK'S *Humiliation* (an *Ecce Homo*) would be more satisfactory if the surrounding demons were omitted. Mr. FRANK DADDS'S *Track of the Matabele*—some troopers with natives looking at a skeleton on the ground—has the qualities which gain popularity. *The Signal*—a Highlander on a rocky point overlooking a lake and sounding a pibroch—by Mr. J. W. NICOL, is one of the most effective illustrations of a subject that might easily be made commonplace. Mr. WALLER has a capital charge of the *Inniskilling Dragoons* at Tournay, in 1794.

THE landscapists are in force this year. Mr. COTMAN never produced a more satisfactory work than his *Rainy Sunset, Wells Cathedral in the Distance*. Mr. BREWTNALL departs from his customary style, and *Doomed*, a vessel on a shoal near high cliffs when night is approaching, might have been painted by STANFIELD or DANBY. In a *Dartmoor Storm* Mr. WIMPERIS has a scene where the fury of the water recalls a northern "spate." Mr. ORROCK'S principal work, *The Estuary of the Nith*, is a more peaceful scene, in which a range of low hills and woods form a contrast with the water that scarcely appears to flow. The scene may be compared with Mr. AUMONIER'S *Sussex Valley*, for both appear to be equally true to nature. Mr. E. HAYES has a wider expanse of water than usual in his *Alone on a Wide, Wide Sea*, which, in spite of the title, is not tragic. The characteristics of the district are well rendered by Mr. EAST in his *Between Abbeville and Amiens*, a river scene with the peculiar hard trees that seem to aim at becoming fireworks, and a placid fisherman. *Starting for the Herring Fishery* suits Mr. R. W. ALLAN'S peculiar blottesque style. Mr. FULLEYLOVE presents *The Parthenon* before it was encumbered with scaffolding of American timber. Altogether the exhibition may be pronounced a success.

THE Corporation of Edinburgh have asked Mr. CAMERON, one of the members, to prepare a scheme for dealing with the building sites which are created by the North Bridge Improvement. It will be remembered that there is a division of opinion among the members on the subject. Some of them wish to have the sites sold to the highest bidders, while others desire to see the Corporation undertake the erection of the buildings. Mr. CAMERON proposes the division of the area into separate blocks, with frontages varying from 50 to 80 feet. The plan shows on the west side of North Bridge Street a slope area of 18,900 superficial feet, exclusive of 3,000 superficial feet of saloon area. On the east side of the street a large increase of saloon area has been secured by a rearrangement of

the lower buildings in the rear, and a large block of general business premises is shown running from North Bridge proper to the west boundary of the area. Taking the shop areas as having the same value as those in George Street, Mr. CAMERON brings out the gross rental of the buildings as 21,881*l.* 8*s.*, and of the same value as those in Princes Street, he assumed the amount is 24,700*l.* The average price of feu-duty per lineal foot of frontage is taken at 7*l.* 2*s.*, and if this figure is capitalised at thirty-three years' purchase the result would be 210,563*l.* for the whole area. The capital value of the increased assessment would be about 52,000*l.* The total feu-duty is 6,378*l.* Mr. CAMERON, however, considers that the cost of carrying out the amended plans could be brought down to 200,000*l.*

A CURIOUS case which should serve as a warning to clergymen who are eager to transform their churches without legal authority, was heard in the Southwell Consistory Court on Tuesday. It appeared from the evidence that the arrangement of the east end of the parish church, Heage, Derbyshire, was considered unsatisfactory, for the parishioners in order to face the pulpit were obliged to be seated with their backs to the holy table. The Rev. G. A. TINDALL, the rector, proposed to make the desired alterations by bringing the table to the west end, and for that purpose submitted a plan to the parishioners. The meeting was, however, said to be irregular. There was no application for a faculty, but without it the rector proceeded to effect the alterations, dismantling the church so that the services had to be performed elsewhere. When, however, he sought to obtain the necessary funds for payment of the cost of refitting the church according to the proposed new arrangement, he was unable to get the money which had been collected, the treasurer of the fund declining to hand it over as the rector could not produce any legal authority for what he had done in the church. The rector was, moreover, threatened with an injunction to restrain him from further interfering with the church unless authorised by a faculty to do so. Application had then to be made for a faculty to authorise what had been done and what it was proposed to do; but it was opposed by six parishioners, who put forward another plan which did not involve any alteration in the position of the holy table. On Tuesday the rector and churchwardens abandoned their proposed scheme, and expressed their willingness to accept that of the six parishioners, but, in answer to the Chancellor, said that they did not themselves propose to ask for a faculty to sanction it. The Chancellor then pointed out that Mr. TINDALL had placed himself in a very awkward position. He had dismantled his church without any legal authority, and by abandoning his own proposal without putting forward another in its place was doing nothing to remedy the illegal act of which he had been guilty, and for which he could be proceeded against under the Church Discipline Act. Under the advice of his solicitor the rector thereupon prayed the Court to grant him a faculty authorising the carrying out of the plan suggested by the opponents. After hearing the evidence of the architect, Mr. P. H. CURREY, the Chancellor (Mr. A. B. KEMPE) said he was, as then advised, of opinion that this plan was a very satisfactory one, and if it were unopposed he should be prepared to sanction it by decreeing a faculty; but, as it had not yet been laid before the parishioners, he must treat the application as one for the issue of a citation only, which he decreed. If, on the publication of the citation, there were no appearance entered in opposition, and the parishioners in vestry approved of the proposal, he would then be prepared to decree the faculty. The petitioners having, in consequence of the opposition of the six parishioners, withdrawn their application for a faculty authorising their original proposal, were ordered to pay the costs of the opponents.

ECCLESIOLOGIA GERMANICA.

By T. FRANCIS BUMPUS.

*(Continued from last week.)**Characteristics of Westphalian and Saxon Architecture.*

THERE are certain districts of Europe that must ever have a peculiar charm for the ecclesiologist. Such are the valley of the Nene from Northampton to Peterborough, along and near whose banks extends such a peerless line of churches as Earls Barton, Higham Ferrers, Raunds, Irchester, Tichmarsh, the Aldwinckles, Barnwell, Oundle, Nassington and Caistor; Lincolnshire, from Sleaford to King's Lynn, with such noble specimens of parochial architecture as Ewerby, Heckington, Boston, Spalding, Whaplode, Gedney and Sutton; the Marshland district to the east of Wisbech,* a tract of country in which, if nature has been niggardly, art has been bountiful, the eye being gladdened at frequent intervals by such noble piles as West Walton, Walsoke, Walpole-St.-Peter, Terrington-St.-John, the Wiggenhalls, Emneth, Elm, Outwell and Upwell; the valley of the Oise from Beauvais to Paris, where a continuous architectural feast is afforded by such noble Early Pointed specimens as Cires and Mello, Creil (with the not far-distant Senlis), Nogent, St. L  u d'Esserent, Champagne, Persan-Beaumont and Auvers, and Normandy between Rouen and Coutances, this last route presenting a succession of buildings which for magnificence can hardly be matched, as witness Lisieux, Caen (with its countless neighbouring village churches, such as Berni  res and Langrune), Norrey, Audrieu and Bayeux.

In the same category Westphalia may, in a modified degree, be said to fall. Although its buildings cannot compete in point of size and purity of detail or conception with those of the other districts just alluded to, they are extremely numerous, valuable as specimens of Northern Romanesque and Transition, and interesting as having come down to us in an almost entirely unaltered state. No student need repine whose lot is cast in Westphalia, for not only in the large towns such as M  nster,† Dortmund,‡ So  st,§ Paderborn,|| H  xter,|| Herford,¶ and Minden** will he find abundant material for the pencil and note-book, but in almost every village or smaller town surrounding or neighbouring to these places, a few of whose names, to be alluded to hereafter, are mentioned below.

One of our most eminent architectural critics has given the buildings of Westphalian Prussia a very bad character. "As a general rule," he remarks, "it may be asserted the churches of Westphalia are singularly devoid of taste and good design. They are extremely numerous, and many of them sufficiently large for architectural effect; but in the earlier or Round Gothic period they betray a clumsiness which is very unpleasing, and in the age of the Pointed Gothic their style is wire-drawn and attenuated to a degree almost worse than the heaviness of that which preceded it. The fact, indeed, is only too apparent, that the Northern Germans were not an artistic people, for neither in Westphalia, nor in any of the countries between it and the Baltic, do we find any churches displaying that beauty of style or constructive appropriateness which characterises those of Cologne or the cities to the southward of that town."††

* A most enjoyable tour taken this summer among many of the examples quoted above has served to awaken all my recollection of their glories, and to impress me with a deeper sense than ever of the vast superiority of our own architecture.

† For Billerbeck, Havixbeck, Notteln and Asbeck; Vreden and Osnabr  ck are also best visited from M  nster.

‡ For Bochum, Kirchlinde, Aplerbeck, Methler, Unna, Frondenberg, Drugelte, Hamm, and J  serlohn.

§ For Lipstadt, Erwitte, Geske, Obern-Tudorf, Boke, Neuenhersee, Brenken and B  ren.

|| For Corvey, Lippoldsb  rg, Warburg, Obermarsburg and L  ge.

¶ For Bielefeld, Lemgo and Enger.

** For Loccum, J  densen, Fischbeck and Hameln.

†† A perusal of L  bke's "Mittelalterliche Kunst in Westfalen" and of Puttrich's "Baukunst des Mittelalters in Sachsen" will be found useful, preparatory to visiting the churches of this part of Germany.

Much of the heaviness of these Westphalian churches, particularly the early Romanesque examples, which have, as I mentioned just now, come down to us in an interestingly unaltered state, is attributed by our critic to the absence of colour from their broad expanses of wall-space. His words, it must be remembered, were penned more than forty years ago, ere the great tide of church restoration and embellishment had made much headway in Germany. This reproach must, however, to a considerable extent be now removed from such buildings as the cathedral at M  nster, whose interior glows with colour in every part, fresco being a species of decoration admirably adapted to the large flat surfaces displayed by that building, with its domical vaults and arches, with their unmoulded intrados springing directly from their pilaster-like columns. With his strictures upon the general character of the Westphalian churches no person of taste will differ, but the student who cares to take up his quarters for a short time in any of the large towns named in the earlier part of these notes will find abundant material in small details for the employment of his pencil. The sculptured saint-guarded portals of M  nster and Paderborn, the window traceries of So  st, Herford and Minden, the furniture of the Dortmund churches, and such charming bits of Romanesque detail as exist in the doorways at Aplerbeck, Boke and Obern-Tudorf, and in the capitals at Corvey, Methler, Ober-Marsburg, Vreden and Wunstorf, are but a few that could be named of such subjects for the sketch or note-book in this part of Germany.

The architecture of Saxony is, generally speaking, of a much more refined character than that of the province just alluded to, recalling in some respects the Byzantine-Romanesque of the south, while the eastern elevations of such churches of the Harz district as Gernrode, Hechlingen, Querfurt and Wechselburg

ABBAY CHURCH OF LAACH: A TYPICAL GROUP OF RHINELAND STEEPLES.

suggest our North of England examples, such as Lastingham, &c. These churches bear a very striking resemblance to one another, being cruciform in plan, with a small apse projecting from the eastern side of either transept in addition to the main one, which, as a rule, is of less breadth and height than the limb to which it has the appearance of being tacked on.

The arcades of the Saxon Romanesque churches exhibit considerable variety, from the Doric simplicity of St. Ulrich at Sangershausen, where the workmanship recalls that in the eastern part of St. Albans Cathedral, to the more exuberantly ornamented ones of St. Michael and St. Godehard at Hildesheim, Gernrode, Paulinzelle and Thalb  rgsel. The triforium rarely appears; an example, however, occurs at Gernrode on a somewhat grandiose scale, while at Hechlingen—where the piers supporting the simple round arches are alternately a cylinder and an elongated square block with a slender shaft niched at each angle—a species of M  nnerchor has been formed on the south side of the nave by inserting a low Pointed arch within each of the main bays, evidently for the purpose of extra accommodation. This M  nnerchor at Hechlingen communicates with a deep western gallery or narthex extending into the nave to the depth of two bays, besides the short space formed between the

towers. These, by the way, are highly picturesque but simple erections, surmounted by low, broad spires of a type met with in Kent, and of which that of Birchington Church, near Margate, appears before the mind's eye as a home illustration. The whole church at Hechlingen is replete with interest, and the student of sculpture will be delighted with the angelic figures which occupy the spandrels of the nave arcades. A piece of unrelieved wall here, as almost everywhere in Saxon Romanesque churches, and probably intended for pictorial enrichment, divides the clerestory—a row of simple round-headed windows—from the arcades. The roofs throughout the building are flat and of the plainest description; * indeed, vaulted roofs in Saxony at this period—eleventh and twelfth centuries—are rarely met with, nor do we find any preparations for groining. Sangershausen and Dobrilugk may, however, be named as exceptions. The latter church exhibits clerestory windows of unusually elongated dimensions, consisting of two round-headed lights of the plate-traceried type, but the head of their circumscribing arch is not pierced. Arnstadt is another rare instance of a vaulted church of the Romanesque period, verging on the Pointed, the triple slender shafts supporting the groining ribs being banded at intervals. The arcades here are exceedingly simple Romanesque ones placed in pairs, those opening into the Männerchor—another noteworthy instance of this appendage remote from the Rhine—being still more simple, and looking as though they had been merely cut out of the wall. Even in such great churches of the Transition period as Naumburg, Mildenfurt and Schulpforta we miss the triforium arcade. Indeed, it is wanting generally in Germany through all the ages of Pointed, as witness Magdeburg, Freiburg and Ulm, where its non-employment causes a blank which, to English eyes, is a great blemish upon those otherwise grandiose interiors.

Churches having Nave and Aisles of the same Height.

The Saxon churches of the Middle and Late Pointed periods are almost exclusively of that class to which allusion has frequently been made in the course of these notes, viz. the one in which the nave and aisles are of equal height and contained beneath one slope of high-pitched roof, the clerestory being of course absent.

Several very noble and refined examples of these churches are found in Saxony: Meissen, Nienburg and Arnstadt belonging to the Early Middle Pointed, and Mühlhausen, Erfurt, Görlitz and Zerbst to its later phases. To all these Saxon examples I shall hope to recur shortly, after a few remarks on the Westphalian ones.

These "Hallenkirchen" or "drei-schiffigen Kirchen"—literally, three-naved churches—are not of very frequent occurrence in the Rhineland, but in Northern and Central Germany there is hardly a town that does not contain one or more such churches; indeed, in Westphalia it seems to have been the prevailing type through all the ages of Pointed. Although exteriorly these churches are too often ungraceful, they must, internally, command our admiration on account of their suitability for town use, their light lofty columns and their spacious areas contributing materially towards this result; but in later examples the workmanship and detail exhibit great slovenliness and attenuation.†

In Westphalia this unclerestoried church made its appearance as early as the Romanesque period, examples being the chapel of St. Bartholomew at Paderborn, St. Ludger at Münster, and the churches of Balne, Jdensen, Kirchlint and Methler; while the Marien-Kirche at Lipstadt, St. John at Billerbeck, the two churches at Obermarsburg and one at Barsinghausen are Transitional specimens of the same class.

The middle of the thirteenth century introduces us to two of the most imposing "three-naved" churches, viz. the cathedral at Paderborn and the Minster at Herford. Later in the same century we have the Dom at Minden. In each of these examples the ungainly appearance of the roof is considerably mitigated by gabling the aisle walls above the windows, the continuous serrating of up-gabling roofs being productive of a very pleasing outline.‡

As I find I have dwelt upon Paderborn Cathedral at some length in a former series of papers, I shall not make further allusion to it at present, but say a few words on the Minster at Herford, to which Paderborn Cathedral in several points bears a very striking resemblance.

The town of Herford, whose picturesque streets are frequently crossed by a small stream—the Werre, a branch of the Weser—grew up around a Benedictine nunnery, whose abbess formed a member of the ninth circle of the Estates General, and in that capacity wielded some influence over the town. This powerful establishment, however, succumbed to the great wave of the Reformation which swept over Northern and Central Germany early in the sixteenth century.

Few churches in this part of Germany afford so interesting an example of the reluctance with which the people of that country abandoned the Round-arched style as this great Minster at Herford. Here we find the tall piers and arches dividing the nave from its aisles unmistakably Pointed, while the windows, placed high up in the walls, are triplets of Romanesque lancets, having richly moulded heads on clusters of slender banded shafts. The ensemble of the interior of Herford, looking across the nave, will recall to those familiar with the churches of South-west France, St. Pierre at Poitiers. Of the two sides of the Minster at Herford the northern one is the more interesting, from its unaltered character; here, beneath the windows, we see such traces of the once magnificent conventual buildings as the vaulting shafts and some springers of the arches belonging to the cloisters. The south side is, however, pleasing from its diversity of outline, presenting not only a Late Gothic transeptal projection, but two very elegant Early Pointed porches. The more western of the two has a Paradise and some mutilated sculpture, an humble edition of those appendages at Münster and Paderborn; the papyrus-like foliage of the central shaft from which this Paradise is vaulted is suggestive of some of the thirteenth-century French work. The eastern doorway has no Paradise; the outer arch to the shallow porch is corbelled off, and the inner doorway has its two openings trefoil-headed, like the western one at St. Cross, Winchester. The tympanum is plain.

A very noticeable feature in the exterior of this church is the enrichment of the transeptal and eastern gables with panel work and pinnacles. Such an arrangement is very common in Central Germany, Herford presenting another example of it in St. Mary-on-the-Hill, quite a gem of fourteenth-century Gothic, and remarkable, as a hall church, for the manner in which it is roofed from north to south, instead of from east to west under one continuous slope. Here the roofs, passing across the church from one gable to another, give it a serrated appearance which is far from unpleasing. Hildesheim and Münster Cathedrals have the gables of their north and south transepts respectively, enriched with a group representing the Procession to Calvary, a favourite subject in this position with the Germans, and of which doubtless other examples could be quoted. Saxony offers several specimens of this gable enrichment, most beautiful of which is that at the church of Schulpforta, close to Naumburg, where there is a group of the Crucifixion in plaster. The Dom at Merseburg, the Marien Kirche at Mühlhausen, and the churches of Jüterbog and Zinna afford other instances of this treatment, chiefly in the form of steps and pinnacles. Some of these examples are, to English eyes, not a little grotesque; indeed, this kind of work must generally be looked upon as more curious than admirable. In Darmstadt, and other towns bordering on the Baltic, it may be seen carried to an extent not a little grotesque at times.

The third of this trio of Westphalian hall churches (*drei-schiffigen Kirchen*) is that of Minden, where one of quite the most beautiful Decorated naves of this province has been inserted between a western tower and a crux of much earlier date. Eastward of the latter is a three-sided apse of tall Flamboyantly-traceried windows. Three very wide arches separate the nave of Minden Cathedral from its aisles. They are borne on magnificent piers, composed of a cylinder round which eight slender ones, four large and four small, are disposed, all with richly-carved capitals. The aisle windows, three on either side, are of extraordinary size, generally of six lights apiece, and with the head filled with tracery, which may be truly said to run riot in fantasy.

In one or two instances the lower part of the great traceried rose filling the window above the lights is cut off, thereby imparting a curious fan-shaped appearance to the composition.

Although not so picturesque as the cathedral of Paderborn, the Dom at Minden, fitted as it is for Catholic worship, with its low open benches, unencumbered area, and rich but not profuse polychromatic decoration, is equally impressive. It is a building no student should omit seeing. Indeed, the whole town abounds in material for the sketch-book. St. Martin's Church in particular deserves to be visited on account of its window tracery, which for elegance and refinement I have rarely seen equalled, that bizarre which is the fault of that in the Dom being absent from it.

Towers and Steeple Groups.

As a rule, the towers of German churches taken singly are rarely successful in impressing us at a first view, a failure attributable in no small degree to the absence of

* The church of St. Michael at Hildesheim has its flat roof gorgeously painted—a roof which it will be remembered formed the model for Mr. L'Estrange when about to undertake his great work at Ely.

† This is very disagreeably illustrated in the Minster at Essen and St. Martin at Münster, where their feeble vaulting and pier arches spring from clumsy thick round columns with mere apologies for capitals.

‡ A good idea of this treatment may be gained by a study of two remarkable London churches of Sir G. G. Scott—St. Mary, Stoke Newington, and St. Andrew, Westminster.

buttresses. Their outline, too, whether of the Later Romanesque, Transitional or complete Gothic periods, is monotonous, owing to the manner in which their height is divided by string-courses, the towers of one period being only distinguishable from those of others by their fenestration.

Considerable variety is, however, observable in the roofing of German towers, and this, together with their position and grouping—which varies with locality—renders their study one of no little interest.

The Apostles' Church at Cologne, the cathedrals of Limburg, Mayence, Speyer and Worms, and the churches of Andernach, Coblenz, Gelnhausen and Laach present the most imposing steeple groups in the Rhenish provinces. In this district, when a church is cruciform the central steeple is not infrequently a low octagon pyramidally capped, though at Bonn, Limburg and Mayence it assumes majestic proportions. At Laach there is an assemblage of six steeples; the Apostles' and Gelnhausen have four apiece; but in all these examples the pair placed in the angles between the transepts and choir is too near the central one to be productive of anything but a confused effect, at least from certain points of view. The Limburg group is in every way the most pleasing of all, the pairs of towers flanking the western façade, as well as that of either transept, being so placed as not to interfere with the octagonal tower and its elegant spire.

The church at Andernach and St. Castor at Coblenz have each a pair of steeples flanking the western façade and the eastern apse, offering pleasing groups. Bonn has slim turrets, with spirelets grouped around a tall central octagon, from which springs direct one of the most graceful of early German spires, while those of Sinzig and Heimersheim—two most interesting Ahr Valley churches—although more humbly dimensioned, assist in imparting an air of great grandeur to the piles which they surmount.

THE PARISH CHURCH OF SINZIG.

Another good example of a solitary central Rhine steeple is that of St. Martin at Cologne, which rises in the most pleasing manner from the crux of three simple round apses. That of the interesting double church at Schwartz Rheindorf, opposite Bonn, deserves mention, while the western tower of St. Quirinus at Neuss, flanked north and south by quasi-transepts, and recalling in general outline that of our own Tewkesbury, plays no small part in composing one of the most dignified western façades on the Lower Rhine.

Generally speaking the spires crowning the Rhenish towers—particularly the slender ones occupying angles—are quadrilateral in plan, sometimes of stone or slate, at others of

metal, and with their ribs starting from the apices of the gables with which the towers are finished. When the tower is flat at the top a pyramidal capping, generally low, takes the place of the above-mentioned spire. Occasionally the angle towers are octagonal, as at the Apostles' Church, Cologne, and at Gelnhausen. In both these instances each side of the tower is gabled, and the whole is crowned by a spirelet of corresponding form. Certain of these unbuttressed German steeples have quite the effect of North Italian campaniles, especially where a very low pyramidal roof covers them, as in the church of Murbach in Alsace, whose square-ended Romanesque choir, with its towers partly forming transepts, are all the remains of a once noble Benedictine establishment.

Passing from Rhenish into Westphalian Prussia, groups of steeples become exceedingly rare, the solitary western one being almost universally the rule in that district. The Middle Pointed churches of St. Peter at Dortmund and St. Catherine at Unna offer pleasing examples of that rare addition to a German tower, the crocketed stone spire; a slate or leaden one, not broached, but spreading itself out at its base like some of our Kentish specimens, being generally employed; and these are in most cases very tapering.

The railway journey from Soest to Paderborn introduces us to a series of steeples which, without possessing much elegance of contour, are truthful purposed pieces of work, and as such elicit our admiration.

The type to which I refer is the gabled one, with or without the addition of a spire. Being much broader, and of more majestic proportions than the Rhenish steeples, these of the district alluded to are better qualified to stand alone, the position they almost invariably occupy being the west end of the nave. Occasionally we find these solitary western towers gabled on their east and west sides only, but more generally on each side, as in that noblest of examples St. Patroclus at Soest,* where the tower supports a well-proportioned octagonal spire of metal. Paderborn Cathedral has had its "cruciform saddleback" tower surmounted by a too attenuated spire of lead, and its original outline thereby destroyed, but the idea may still be seen in the steeple of the Busdorf-Kirche, where the four roofs meet in a turret, and this seems to be the prevailing type in the churches around this city. Gesecke, a village on the line between Soest and Paderborn, has a remarkably imposing tower, gabled north and south, with a pinnacled turret rising from the ridge-crest.

(To be continued.)

DESIGN IN LETTERING.†

(Concluded from last week.)

Lettering in Ornament.

MY discourse has been so far on "Lettering; its Design, its Decoration and Treatment." To-night I am going to speak more especially of its use and application, once its design is mastered. The question is no longer of ornamental lettering, but of lettering in ornament. But first I have a word to say about the initial letter generally and its ornamental use.

The *raison d'être* of an initial letter is that it should mark a beginning. It may be desirable to mark that beginning more or less emphatically; and there is opportunity and need, indeed, of considerable judgment on the part of writer or printer in proportioning this emphasis to the occasion. I can imagine a case in which two or three series of initials might be used with varying emphasis in the same pages, but it would tax the judgment of anyone so to use them.

Nothing is gained by devising a variety of names for what is after all practically the same thing. The distinction, for example, between "initials" and "versals" is ecclesiastical. I use that ugly, made-up word to express a made-up thing. For whether it is an initial (which begins), or a versal (to which the priest turns), is a matter of no account: in either case the letter is a sort of signal or reminder. If a versal does not mark absolutely a beginning it indicates at least where the reader is to begin afresh. The initial heads the chapter, then, as the capital heads the sentence or the word. It all means emphasis.

William Morris, in the very beautiful title-page to his "Story of the Glittering Plain," makes most effective use of what would commonly be called initial letters as capital letters, not, you will observe, honouring the initial "t" of the word "the" with so much as a plain capital, which, in fact, it does not deserve—for, though it happens to come first, it is relatively

* The steeple of this church, as well as the beautiful fourteenth-century lanterns of St. Mary-over-the-Water and St. Lüdger at Münster, will be found described and illustrated in *The Architect* of July 24 and October 2, 1896.

† Abstract of a course of Cantor Lectures, by Mr. Lewis Foreman Day, published in the *Journal of the Society of Arts*.

insignificant. The art of design is in putting things in their places and giving them their right value. That is what William Morris did.

An initial need not, because it is meant to be emphatic, on that account be very big. In common speech we emphasise a word more effectually by pausing before it than by shouting it. And the idea of pause may well explain, and to some extent justify, a certain disregard of obvious legibility in the initial. In the initial, if anywhere, it is permitted to be fanciful; it makes a pause before reading. Ornament which elsewhere might be altogether superfluous is here of distinct use in calling attention to the letter: by the time you begin reading, the form of even a rather involved initial will probably have emerged plainly enough from its ornamental entanglement.

That, to my mind, is no excuse for the pictorial initial. A picture may be more beautiful than any letter, and it may answer just as well to mark a beginning. In that case let us, if you like, have the picture instead of it, but don't let us disguise it by clapping a letter in front of it.

There are obvious limits to the purely ornamental initial, but I think there is still scope for design of the purely ornamental kind from which designers were diverted as early as the sixth or seventh century by the attraction of torturing birds, beasts and fishes into shapes which might do duty for lettering: the interlacing capitals of the Anglo-Saxon scribes would have been more beautiful if they had not been always breaking out into heads of nondescript creatures.

An initial letter attracts attention to itself (even though it be not very large) by its very weight and character. You cannot well overlook it. And there is no occasion because the letter is put in by hand that it should gesticulate wildly at you, as it often did. Without saying that such a thing should never be done, I must own I am inclined to resent the initial that sprawls all over the margin of the page. The illuminators, I know, looked upon the margin of a book as their own, a field for their exploits; but, once accustomed to the margin, I can't bring myself to consent to its sacrifice even to the ornamentist. By all means let us have ornamental borders and the like, but let us plan them within the margin, which is the fitting, the only, the necessary frame to MS. and type alike. The justly famous choir-books at Siena are illuminated with a delicacy rare even in Italian MSS. The pictures are perfect miniatures, but they are miniatures rather out of place. A delicate little figure should not be framed by a disproportionate initial decorated with dolphins as big as the saint herself. The charm of the page shown is in the perfection of the work, both in the miniature and in the ornament; as a page it is by no means perfect; it is not a whole.

The illuminated initial naturally affords scope, which printing does not. It may quite safely encroach upon smaller lettering, and it is the business of the illuminator to make it break the text pleasantly. Many of the Mediaeval initials are beautiful; the letters are enriched and glorified by ornament, which yet does not overstep the bounds of reticence, and the result is dignity.

A more serious danger than that of losing the letter in superfluous ornament is lest it should be detached from the context. The larger the initial the more danger there is of that. You may separate the "D" in "Danger" so entirely from the word that it reads "anger." I remember my eye being once caught by the word "election" on a placard. It turned out to refer to "popular songs"—a "Selection" it should have read, but the "S" did not count as part of the word. There is a vice doubly vicious in the case of an advertisement.

Lettering is so bound up with the printing of books that these inevitably come in for a large share of consideration in discussing the subject. The title-page naturally assumes extreme importance.

You have there another of William Morris's strongly personal designs (we have lost William Morris, but his influence will live). In this title to Rossetti's poems we have a bold Roman letter encircled by meandering ornament too delicate to interfere with it, merely greying the ground, as it were. And, observe, the border has the value of a deeper grey tint.

Yet more effective is the title to "The Book of Wisdom and Lies," in which the letters are in white on a black ground, filigreed over with delicate ornament, the stems of which interlace with them very happily. The initial T on the opposite page just sufficiently carries the black into that, and makes the double page one.

A yet more beautiful page of Morris's bears the title of the "Tale of King Beowulf," also in light letters upon dark; but here the border, bold and effective as it is, is merged in effect with the panel it encloses, and we get one mystery of richest ornament, out of which the words grow, as it were, into significance as you look.

Not only in the pages of books, but on their covers, lettering forms often a valuable ornamental feature—sometimes a very important one.

In the Grolier binding shown it is not conspicuous, but it is

enough, and it requires taste to do so little. Clearly the more exquisite the design of the "tooling," the more seriously it would be hurt by coarse or ill-considered lettering.

Lettering is in itself ornamental; a well-printed page, consistently set up in type of all one character, though it may be, as here, of various sizes, not displayed after the distracting fashion of the modern printer, nor disfigured by superfluous squiggles or ornament, a merely well-planned page is a thing of beauty; but it wants planning with that rarest of qualities—taste.

A mere inscription is yet more susceptible of decorative treatment, even though devoid of ornament. The deviation from the simplicity of the normal letter may be but slight and the effect yet ornamental. Of the two modern inscriptions there, both, as it happens, designed by way of advertisement, the upper one (designed some twenty-five years ago or more) is excellent. It departs from orthodoxy, but not from moderation. The lower one (American) is rather affectedly up-to-date. The letters are all "kicking up behind and before." High kicking is the rage; but I think the advertiser takes too readily for granted our interest in what he has to say.

I don't see why the artist should not take, on occasion, all manner of liberties with the size of letters, but there should be a reason for it. It should be done for the purpose of emphasis, to fill the line more evenly, to make the letters compose better, and not for the sake of mere oddity.

I have no faults to find with the freaks of the thirteenth-century scribe whose handiwork I show you; but then he was not writing an advertisement, but inscribing at the head of his chapter, as a mere formality, words which might be "taken as read." Their use, in fact, was, as much as anything, ornamental.

The decorative value of a simple panel of lettering is conspicuously shown in the tomb of Mary of Burgundy, at Bruges. The inscription itself is beautiful and legible enough, for all the flourishing of the letters, which are fantastic only at the base, where they can afford to be playful, their work being done. Mere inscription occupies there the place of honour—and deserves it.

Lines of lettering play again an important part in the composition of Sir E. B. Jones's gesso panel, "Perseus and the Grææ." The deep band of Roman text occupies the vacant space above the figures without in the least disturbing its breadth. You feel it is just what was wanted there. It has the value of ornament without any of the attractiveness which might have injured the picture.

There is a reminder in this most modern work of the inscriptions, as old as Sennacherib, deliberately carved in broad horizontal belts of cuneiform characters right across the figures in the reliefs from Nineveh. It is strange how readily one accepts that kind of brutality. The truth is the writing does but little hurt to such broadly conventional figures, and it has considerable decorative value.

In early sixteenth-century tapestries we sometimes find the name of a personage written straight across his body, not, as it were, embroidered on the drapery, but planted boldly in front of it; and I, for one, accept that as perfectly satisfactory.

Another use for inscription is by way of border to the picture, as in the little terra-cotta shown, and on many a Mediaeval brass and monumental stone. It was a favourite practice in the fifteenth and sixteenth centuries and never failed of success.

A very pronounced use of inscription was made to separate subject from subject in those little figure groups in which the Mediaeval designer delighted. The door from Le Puy, there, is designed in little square panels enclosed in bands of lettering, at least as important as the pictures it frames. It is all very flatly carved, not much more than grounded out. The contractions in the lettering make it difficult to decipher; but it proves to be Latin hexameters (explanatory, of course, of the subjects) running right across the four divisions of the door.

It was a favourite plan of the glass painter also to keep his pictures apart by interspaces of lettering.

In the Jesse window, on the other hand, from Troyes, the inscribed words form part of the picture, and ornamentally a very valuable part; remove them and the design would suffer considerably. They give just the horizontal lines necessary to counteract the uprightness of the window mullions.

A much simpler use of lettering is shown in the glass from New College, Oxford, where the background to the figure is just sprinkled with crowned "M's." They are just enough to break the monotony of the ground, at the same time that they convey to you that this is indeed the Virgin Mary.

In coins lettering forms naturally an item in the design. We always arrange it round the rim. That is one way of doing it—but not the only one. The Greeks were never so wedded to one mechanical idea. They worked quite as often in columns, vertical or horizontal, and you see by the direction of the arrows there that the writing took all manner of directions—we are as conservative in that as in the way we pass the wine

Again, the medallists of the Renaissance were not anything like so bigoted as we. Where the words follow the rim they are as likely as not interrupted, perhaps by a band of lettering across the medal, and the interruption is usually welcome. The proportion of the letter is, of course, an all-important point.

The modern designs of M. Roti show taste and judgment in the introduction of lettering very rare indeed in nineteenth-century design, and he, too, uses it in various ways, and not on one cut and dry system, as may be seen in the series of designs by him.

While the coins and medals are fresh in your minds I will show you some Italian majolica plaques in which also the design is planned to fit the circle. The first is a marriage plate. "My heart I bear to you," says the lady—and she does, proudly and uncompromisingly. A more decorative treatment is where the motto is inscribed on a label. Here it takes the line of the circle, and its curled up ends are made use of to furnish the space about the lady's shoulders. The circumscribing of the background by the label passing behind the head is a most useful device in composition. With the twisting of the label comes the question how the lettering upon it ought to run. It seems only logical to ask that it should be confined to one side of the label only. In that case care has to be taken lest part of it should be shown upside down. It is easier, as there, to ignore the difference between the front and back of the ribbon—I prefer more conscientiousness. You may assume, of course, that the label is first twisted and then inscribed. You must do so unless you are prepared to let great part of your inscription be lost, but in any case the label ought to be and ought to look, as it were, designed to take the lettering. In the example shown, all that ribbon was not wanted to bear one little word—it is flourished about obviously only to fill up.

The label on the Gubbio drug-vase shows the origin of the idea; it is clear that it takes the place of the strip of parchment on which the name of the drug would else have been written.

Great use was made of the label in stained-glass. It is often much more elaborate than in the lights exhibited from Ross, but there you have the typical treatment. The length to which inscription was carried in Gothic design is shown in a very curious carpet at South Kensington. You find there not only a double series of labels canoping the figures, but broad labels, parti-coloured, white and yellow throughout their length. Moreover, the lettering is not uniformly coloured. Red words alternate with blue, for example, each with its white initial, all on a gold coloured ground. Sometimes the variation of colour is not according to the words at all, but as the artist listed.

In the border to a late Flemish brass the label takes a meandering line, whilst in the side spaces are little figures bearing other inscribed labels. You see them at a disadvantage there—they appear to stand on their heads. The design was intended of course for a pavement brass.

Again, unusual is the device of two bands of lettering, interlacing to form a border, one of which always presents itself to the reader the wrong way about.

In the German needlework parts of an altar cloth—a real linen cloth, not one of those gorgeous arrangements in velvet and gold which seem to contradict the fundamental idea of the Lord's Supper—the bands of black letter steady the design and give variety.

Skilful but very reticent use of lettering is shown in a Portuguese cabinet at the Hôtel Cluny. Interlaid at intervals round the edge of it are the words "Audeo," "Spero."

A very simple box-front illustrates the way a word may be so distributed by the carver as to be in a way disguised, and yet plainly there. You do not at first realise that the letters spell the name Jakeline.

Much more elegantly designed letters occur in the box-top bearing the A of Anne of Brittany. The position of the letters on the box-top (a thing which has no right way up, but may be looked at from either side) justifies the reversing of the letter. As you see it there, you fancy the letters are A. V.

I come now to the subject of monograms.

Designers of monograms very often don't play fair—perhaps because they don't know the rules of the game. A monogram, as its name implies, is the union in one sign or compound letter of all the letters of a word (usually a proper name) or of the several initials of a person's name; the mere interlacing of letters complete in themselves, and independent one of the other, forms, not a monogram, but only a cypher. In a monogram there should be no letter which does not also form part of another.

The common practice is to interlace two independent letters. And even these cyphers are eked out by ornament which is no part of them, and where that is not so one of the letters is perhaps so extravagantly shaped as hardly to pass for what it represents. Very commonly one of them is unduly drawn out to make it loop with the other. Often letters of two quite different styles of design are incongruously harnessed together. Sometimes they don't properly interlace; one is just planted in front of the other. That may be permissible; but the other plan is preferable.

In monogram design naturally the letters you have to deal with, and your purpose, suggest the kind of letter you adopt; but the simpler are, as a rule, the more serviceable. The late Gothic capital form is about the least promising for a monogram—it is involved already.

You may think it hard lines to lay down the rule that each letter must form part of another, and no one of them be independent. Well, those are the rules of the game. You need not play it.

It may not be possible in every case to make a true monogram out of given letters; godfathers and godmothers, in baptism, do not take into account the difficult task they may be providing for the designer, when they bestow their awkwardly assorted names upon us.

I have tried there what I could do with the letters of the alphabet three by three as they occur. I give you them as they came. No doubt they could be bettered, but that is the best I could do right off. You will see I have managed to make true monograms of most of them.

It was a common practice not only to interlace letters but to reverse them—or one of them. By this turning over of the letters you get symmetry, but it is rather a cheap way of getting it.

In the severer cyphers on the Palissy plate, the C is reversed; the H also is sometimes doubled, without being merely turned over.

A masterpiece is the vigorous and individual design of Van Meckenhen, in which he makes a mystery of his own name.

Hidden away in the beautiful little ceiling of a window bay in the chamber of Isabella d'Este, at Mantua, are sundry cyphers and mottos, but the lettering is not of great importance in design.

In the embroidered cloth, on the other hand, the lettering is almost everything. And it shows how decorative even stiffly drawn devices may be. It only wants the artist, and he must feel that lettering is worth doing.

The cyphers on the key handles of the seventeenth and eighteenth centuries are not very clearly made out amidst the lines of scroll purposely designed to mingle with them. By means of the scrollery it would have been easy to balance the several compositions without doubling over the letters, as is usually done. But, take them for what they are, those are elegantly designed.

Never perhaps was the cypher turned to more dignified use than in the ceiling of the Salle de Diane at Fontainebleau. We are apt to associate monograms and cyphers with something rather small and finikin; but the breadth and dignity of that ceiling is unsurpassed.

Obviously it was not desired that the German letters next shown should be too easily read; they are embroidered in two colours so that the continuity of the latter is broken. In early Lombard and Saxon MSS. capitals were similarly parti-coloured. This is a device which may on occasion be of considerable value to the designer.

Gothic lettering makes nearly all the ornament in the fifteenth century lock there. The shape of the letters owes something to the necessity of chiselling them in iron. The design is interesting, but the smith has carried his work to a point of delicacy at which it was bound to suffer with rough usage—as you see it has.

Of modern lettering I have only time to show you a single specimen—just to remind you of the many ingenious and beautiful things Walter Crane has done in that way. This is from his "Book of Marriage Days," the stems of the dog-rose grow into the word "June."

Most characteristic is the use of lettering in the Visigothic crown preserved at the Cluny. It is a votive crown, you will remember, not meant to be worn on the head but to be hung up before a shrine. Hence the kind of fringe into which the letters are worked. It is barbaric, perhaps, but the barbaric is often ornamental, and this is work of the seventh or eighth century. One seems to trace in it some oriental influence—or imagines it, perhaps, remembering the Moors in Spain.

The people who succeeded above all others in making really decorative use of lettering were the Arabs. The laws of the Prophet forbidding them to picture things, the natural desire to tell something in design led to the profuse use of inscription, and natural ingenuity and ornamental instinct aiding, they accomplished marvels. Very probably they took liberties with the written character which we should not be allowed to take. Possibly we find the Arab lettering all the more ornamental because we don't understand it, and the words, therefore, don't shout at us, but anyway the end of art is gained.

There are two forms of Arabic alphabet, the "cufic" and "neskhi." The cufic is that stiff rectangular graven character shown in Alhambresque ornament, which you only suspect to be lettering because it would be difficult otherwise to account for the rather odd form of ornament—for ornament it is.

Designers will note how in such work the letters are

detached from the arabesque by the simple device of fretting the surface of the ornament, which else might compete with them. As it is, they keep their place.

The neskhi writing is the rounder and more elegant character, whose flowing, sweeping lines proclaim the pen. This is, in fact, the cursive hand, and has undergone considerable modification in various countries—as writing would.

The example on the screen is from some beautiful Damascus tiles—painted, of course, but retaining much of the pen character—the letters are in white against a background of blue on blue.

Compare the “cufic” character with the square form of the Chinese alphabet which, as I explained, was the monumental, as distinguished from the written character, which was brushwork. I think the Chinese characters make ornament.

To return to the Arabs. Naturally they made most use of the suaver neskhi character. This is very freely treated in the plaque of Persian faience, and there the character of the lettering tells pretty plainly the way it was done. That is clearly not carving; it is soft clay or slip, which is applied to the face of the tile and fused with it in the furnace; then it is decorated in colour and lustre.

The wall diaper from Tunis is the kind of thing familiar to us in the Alhambra. The words are, as it were, built into an all-over pattern of great richness. The Moors in Spain make that kind of raised plasterwork gorgeous with blue and red and gold enough to reconcile even crude colours.

Time fails in which to carry further this most interesting subject. I will end by saying that if only we modern Europeans were allowed to play with letters as the Arabs did, we might, with practice, arrive (even with our alphabet) at something like ornament.

That is the point to which all I have said is really directed, that artists should dare believe there are possibilities in lettering; it is only in that faith that art is possible.

ESSEX ARCHÆOLOGICAL SOCIETY.

A NUMBER of members of this Society made an excursion on the 12th inst. to Takeley, Great Canfield and Hatfield Broad Oak. The meeting place was Takeley railway station. Mr. G. Alan Lowndes, president, acted as conductor to the party, which first proceeded to Takeley Church. Mr. Lowndes described the edifice, which is of the Perpendicular period. On the north side of the nave were pointed out the original oak benches and pulpit. A Jacobean or Elizabethan wardrobe in the vestry, used for surplices, gave rise to some discussion as to its original use in the church. Monuments and brasses were examined and the exterior of the church was inspected, many interesting architectural features being pointed out by the Rev. J. W. Kenworthy, of Braintree, and others. Leaving Takeley, the party proceeded to Great Canfield, where a long stay was made because of the absorbing interest which the church and the mount command. The vicar, the Rev. G. M. Wilson, read an interesting paper written by Mr. J. G. Waller, on the inscription and symbols found on the pillars of the church porch. On the capitals of the pillars were pointed out some very rare designs of symbolic ornamentation, while on the left jamb was shown and explained an Oriental legend of great antiquity. In the chancel the Rev. G. M. Wilson read an article by Mr. Waller on the beautiful fresco paintings under the east window, which, after being whitewashed over and lost sight of for centuries, were accidentally discovered in 1876 when the church was restored. The late Bishop of Colchester was the authority for establishing the fact that the church was originally dedicated to the Virgin Mary, as shown by these paintings. The chancel arch was said to be Early Norman, and on it were seen some very ancient carvings, which lead to the supposition that the stonework formerly belonged to some other structure.

Canfield Mount was next visited, and on the top of this extraordinary earthwork of the ancients Mr. G. F. Beaumont, F.S.A., the hon. secretary, read a paper by Mr. E. A. Downman on this and similar mounds in the county. Various “finds” were made at a spot where some shallow excavations had previously taken place, comprising pieces of British pottery, worked flints, &c.

By the kindness of the President the company sat down to an enjoyable tea in the village schoolroom. After tea, on the proposition of Mr. E. A. Fitch, a hearty vote of thanks was passed to Mr. Lowndes for arranging and conducting the meeting, and also for his hospitality. Mr. Lowndes, in responding, proposed a vote of thanks to the Rev. F. W. Galpin for his paper. The rev. gentleman acknowledged the compliment, and invited the party to spend half an hour at the vicarage before leaving. Here he showed them a rare collection of musical instruments of every age and nation, and performed on many of them, to the great delight of the party.

The next move was to Barrington Hall, Hatfield Broad Oak, the residence of the President. Here the party was joined

by Lady Rookwood and others. Mr. Lowndes welcomed the guests to his beautiful home, and in the spacious drawing-room read an exhaustive and interesting paper dealing with the history of Hatfield Broad Oak and its manors. There are at Barrington Hall some of the most magnificent examples of stucco-work in the country. These were much admired, as also were several valuable historical paintings. A walk across the park brought the visitors to Hatfield Church, where they were met by the vicar, the Rev. F. W. Galpin. In honour of the visit a flag was hoisted on the tower. The Vicar, who has recently by excavation discovered the exact site and proportions of the old conventual church and monastic buildings, adjoining the present church, read a paper on the subject, and illustrated the ground plan of the ancient structures on a black-board.

ST. BOTOLPH, CARLTON-IN-CLEVELAND.

THE new church of St. Botolph, Carlton-in-Cleveland, was consecrated on the 15th inst. by His Grace the Archbishop of York. The church is situated on rising ground at the north end of the village, and is designed in the fourteenth-century style of English Gothic. It consists of a nave and chancel, with clerestory, under one unbroken roof; a west tower, which is only completed as far as the nave-roof level at present; north and south aisles and south porch. There is a fine east window of five lights with rich tracery. The interior is simple and striking, the proportion being very good; an unusual feature is the treatment of the lower part of the tower, which is vaulted over in stone, with a gallery above for the ringers. The chancel is spacious and dignified, the altar being raised three steps above the nave. The east end of the north aisle is screened off to form a vestry. The internal walls are of dressed local stone as well as the exterior, and the finish of the masonry is remarkably good.

The main roof is of barrel form, with a boarded and panelled ceiling of oak. The church has been designed by Mr. Temple Moore, and the contractor is Mr. R. P. Broton, of Bilsdale.

TESSERÆ.

Proportions of Windows.

THE proportions of window openings and interspaces of openings and their architraves are not to be set out invariably on the dicta of any men. The first especially must in practice materially depend upon necessity, and, moreover, it may be remarked that even where windows have only the same space as themselves between them, the same idea of breadth and strength which more than double their width between them gives may be gained by extra height between their heads and the cills of the next floor openings, and though we owe much to the investigators on proportion as to the effect of inter-widths, we have no data about inter-heights, which, for a noble appearance in a building, should be as great as is usually possible. As to the proportion of architraves being not less than a sixth or more than a fifth of the void, it is difficult to conceive on what ground it is asserted. Many most excellent openings, even in Italian architecture, are more; the gate of Ghiberti at Florence, for instance. In other styles it would be useless to particularise what should be the general rule. Not that from this it is to be inferred that in Classical art these rules of proportion can be harmlessly played with by everyone. Rules of whatever kind are most valuable when not meant to repress design, and as a starting-point from which we may see how we can effect improvement; indeed, though they have had the effect of making architecture a commonplace business, executed by commonplace men, yet to one who has been tossed about in the uncertainty of original design, they are like terra firma to his unsteady footing. These rules of proportion especially are most difficult and most valuable, and that they have been departed from at times with great success is no depreciation of their use for the ordinary practitioner; those deviations were effected by men of great genius guided by study.

Karl Schinkel.

Karl Friedrich Schinkel was born at Neuruppin, where his father was “superintendent,” March 13, 1781. On his father's death in 1787 he was left dependent upon his mother, who placed him in the gymnasium or public school of his native town until the age of fourteen, when the family removed to Berlin. Having manifested a taste for drawing and designing, he there became a pupil of the elder Gilly, the architect, and afterwards of the son, Professor Gilly, to whose instructions he was in no small degree indebted for the liberal views he afterwards entertained of his art, as one affording scope for the exercise of invention, fancy and taste. The younger Gilly, however, died within about two years, and the completion of several buildings was in consequence entrusted to Schinkel.

Not long after this period he began to apply himself more to designing and to the study of architectural composition; also to making designs for vases, bronzework, ornamental furniture and other things of the kind. At length he determined upon visiting Italy, and set out for that country in the spring of 1808, taking his route through Dresden, Prague, Vienna and Trieste. After examining the antiquities of Istria, he passed over to Venice, then proceeded to Florence and Rome, and in the following year to Naples and Sicily, returning through France, and reaching Berlin after an absence of two years. At that period the state of public affairs in Prussia was exceedingly unpropitious to his prospects in his profession, more especially in that higher department of it to which he aspired, and he therefore devoted himself for awhile to landscape-painting, partly views of some of the places he had visited and partly original compositions, which he generally made the vehicle of his architectural ideas, introducing into them studies and designs of his own. These productions earned for him no small reputation, and by so doing they probably opened for him the career in which he subsequently obtained celebrity. On the return of the royal family he was commissioned to make designs for some alterations in the palace, and in 1810 was appointed assessor of the *Baudeputation* or Board of Works and Buildings, his duty being to give his advice upon matters of taste. When the war with France was terminated, he received an order from the King of Prussia to prepare designs for a cathedral to be erected in Berlin as a memorial in honour of the military achievements of his subjects. But although all the plans and drawings for this *Pracht-bau* were finished, it was considered more advisable to postpone the work. Nevertheless, though he was doomed to disappointment in regard to the execution of that magnificent project, the restoration of peace was the epoch from which Schinkel's career as an architect may be dated. It was at that period his talents were first called into play, and important opportunities afforded them almost uninterruptedly for a series of years, during which he not only erected most of the finest of the public structures which now grace the capital of Prussia, but also many at Potsdam and various other places, besides numerous others for private individuals. To Schinkel, it has been observed, Berlin is indebted for a new physiognomy, one that imparts to it an original and peculiar character; and certainly his works, even the least successful of them, give evidence of geniality and of an inventive mind, less scrupulous as to following established precedents than ambitious of forming precedents for others and of extending the limits of the art. Among the earliest and certainly not the least successful of his works in the capital are the large Theatre, the Wachtgebaude and the Museum. To these succeeded the Werder Church, Bauschule, Observatory, &c. Of the buildings here mentioned, together with a great many others, the designs are given in his "Eutwürfe." Schinkel died in October 1841.

Scottish Fortresses.

Before the accession of James VI. to the throne of England the situation of Scotland was such that every baron's house was more or less fortified, according to the power or consequence of its lord or according to the situation of the castle. Near Edinburgh or Stirling, where the inhabitants were somewhat polished in their manners and overawed by the seat of government, no more was necessary than towers capable of resisting the cursory attacks of robbers and thieves, who never durst stop to make a regular investment, but plundered by surprise, and if repulsed, instantly fled. But when further removed, as in Perthshire, Inverness-shire or Aberdeenshire, then it was necessary to be better defended; and the aids of a peel or dungeon, with outer walls, moat, wet ditch and barnakin were added to enable the lord of the keep to resist the formidable attack of his powerful adversary. The history of Scotland, so late as the reign of the Stuart family, affords a number of melancholy instances of inveterate feuds among the greater and lesser barons of that period, when every mode of fortification then in use was seldom adequate to the defence of the castle against the storm or blockade of the enraged chieftain. The third kind of fortresses which we meet with in Scotland consists of those situated on the borders of England, or on the sea-coasts of the kingdom, and in the Western Isles and in very remote places. Many of the old castles in Scotland were situated on an island in a deep lake, or on a peninsula which, by a broad deep cut, was made an island. This kind of fortress was only accessible in a hard frost or by boats, which were not easily transported by a people destitute of good roads and wheel-carriages. In fact, they could only be taken by surprise or blockade, the first of which was difficult and the second tedious; so that before the use of artillery they might be deemed almost impregnable. On this account their situation was very desirable in the inland parts of Scotland. On the sea-coasts of Scotland we generally find the strongest and most ancient as well as the most impregnable castles, since these had to defend themselves from the invasion of the foreign enemy as well as

the attacks of the domestic foe. Thus the barons whose lands extended to the sea-coast perched, like the eagle, on the most inaccessible rocks that lay within their possessions.

Removal of Monoliths from Quarries.

Vitruvius mentions with approbation the following contrivance, which he says was invented by Metagenes, for conveying from the quarry the shafts of the columns and the stones intended to be employed for the architrave in the portico of the Temple of Diana, at Ephesus. The ground between the quarry and the temple being too soft to allow such masses of stone to be brought up by ordinary wheel-carriages, the architect or engineer covered each extremity of the block of stone with a frame of timber, from the middle of which projected a short axle of iron; this being received in a gudgeon at the centre of a broad cylinder or wheel placed at each end of the frame containing the stone, and oxen being harnessed to the frame, the stone was thus drawn up to the building. Vitruvius also describes an unsuccessful attempt which was made by an engineer named Paconius to bring from a quarry a mass of stone containing about 576 cubic feet. For this purpose two broad cylinders of wood, 15 feet in diameter, were constructed, and the stone, being raised from the ground, was made to rest between them, the line of its length being in a horizontal position in the direction of their common axis; then a rope being wound round the circumference of the united cylinders in the middle of the length of the latter, and one end of it being made fast to the harness of the oxen, it was intended that by the motion of the animals the cylinder should revolve on the ground and the stone be brought up to its place. The contrivance appears to have failed; but had the oxen been attached to the two ends of the cylinder instead of its middle, there is no reason to doubt that it would have succeeded.

Ancient Camps.

The Hebrew camp during the exodus was of a quadrangular form, surrounded with an enclosure of the height of ten hand-breadths. It formed a square of 12 miles in compass about the tabernacle, and within this was another called the Levites' camp. The Greek camps were fortified with gates and ditches. The Lacedæmonians formed their camps in a circular shape. Of other Grecian camps it may be observed that the most valiant soldiers were placed at the extremities. Thus in the Iliad, Achilles and Ajax were stationed at the extremities of the camp before Troy. The figure of the Roman camp (*castra*) was a square divided into two principal parts. In the upper part were the general's pavilion or *prætorium*, and the tents of the chief officers; in the lower were those of inferior degree. On one side of the *prætorium* stood the *quæstorium* or quarters of the treasurer of the army, and near this the forum, called also *quintana*, where things were sold and meetings held. On the other side of the *prætorium* were lodged the *legati*, and below it the tribunes had their quarters opposite to their respective legions. In this part of the camp also were the tents of the *præfecti* of the foreign troops, as well as those of the *evocati* and of the *extraordinarii* and *ablecti*, both horse and foot. The precise order in which they were arranged is unknown. Between the two divisions was a broad open space called *principia*, where the tribunal of the general was erected when he either administered justice or harangued the army, where punishments were inflicted and the principal standards, with the altars and images of the gods, were placed. The middle of the lower division was assigned to the Roman horse, next to them were quartered the *triarii*, then the *principes*, and close by them the *hastati*. The companies of foreign horse and foot were posted on the flanks and carefully kept apart to obviate the danger of a treacherous coalition. The Roman camp had four gates and was surrounded by a rampart termed *vallum*, and a ditch, *fossa*. The agger or mound of earth was secured by sudes or sharp wooden stakes. The camps were sometimes surrounded by walls built of hewn stone, and the soldiers' quarters were occasionally formed of the same materials.

Sensations of Colour.

The immediate effects of the combinations of the primitive colours on the sense of sight afford an illustration of some of the physiological characters of sensation in general. It is well known that a mixture of red and green light produces a simple sensation, perfectly identical with that which belongs to the minute portion of yellow light originally found in the spectrum, and that a mixture of green and violet makes a perfect blue. The blue colour of the flame of spirit of wine, for example, is derived entirely from a mixture of green and violet rays; while the blue light of the lower part of the flame of a candle is shown by the prism to consist of five different portions, belonging to different parts of the spectrum, nearly resembling those which would be distinguished if we looked through a prism at a small portion of a transparent plate of a certain minute thickness. It is obvious, therefore, that the eye has no immediate power of analysing such light; and if we seek for the

simplest arrangement, which would enable it to receive and discriminate the impressions of the different parts of the specimen, we may suppose three distinct sensations only to be excited by the rays of the three principal pure colours falling on any given point of the retina, the red, the green and the violet; while the rays occupying the intermediate spaces are capable of producing mixed sensations, the yellow those which belong to the red and green, and the blue those which belong to the green and violet; the mixed excitement producing in this case, as well as in that of mixed light, a simple idea only, although it must be observed that no homogeneous light can extend its action so far as to excite at once the sensations of the fibres belonging to the red and the violet, so that every crimson must necessarily be a compound colour. A mixture of red and blue light exhibits an effect which appears unintelligible upon the supposition that a compound light ought to produce a colour intermediate between those of its constituent parts; but this difficulty will vanish if we assume that the blue of the spectrum contains a greater proportion of violet than of green, so that the green is neutralised into a white by a mixture with the red and part of the violet, and the remaining violet gives its character to the whole, either alone, or with a mixture of red, according to the proportions employed.

Mediæval Heraldry.

To distinguish him in battle, as his face was hid by the helmet, the knight wore above his armour a surcoat, as it was called, like a herald's coat, on which his arms were emblazoned. Others had them painted on the shield, a small triangular buckler of light wood, covered with leather, and sometimes plated with steel, which, as best suited him, the knight could either wield on his left arm or suffer to hang down from his neck as an additional defence to his breast when the left hand was required for the management of the horse. The shape of these shields is preserved, being that on which heraldic coats are most frequently blazoned. But it is something remarkable that no one of these heater shields has been preserved in the Tower, or, so far as we know, in any English collection. The helmet was surmounted by a crest, which the knight adopted after his own fancy. There was deadly offence taken if one knight, without right, assumed the armorial bearings of another, and history is full of disputes on that head, some of which terminated fatally. The heralds were the persons appealed to on these occasions when the dispute was carried on in peace, and hence flowed the science, as it was called, of heraldry, with all its fantastic niceties. By degrees the crest and device became also hereditary, as well as the bearings on the shield. In addition to his armorial bearings, the knight distinguished himself in battle by shouting out his war-cry, which was echoed by his followers. It was usually the name of some favourite saint, united with that of his own family. If the knight had followers under his command they re-echoed his war-cry and rallied round his pennon or flag at the sound. The pennon differed from the penoncel or triangular streamer which the squire was entitled to display, being double the breadth, and indented at the end like the tail of a swallow. It presented the appearance of two penoncels united at the end next the staff, a consideration which was not perhaps out of view in determining its shape. Of course the reader will understand that those knights only displayed a pennon who had retainers to support and defend it, the mounting this ensign being a matter of privilege, not of obligation.

Metal Mirrors.

Homer, in describing Juno at her toilet, makes no mention of a speculum; but in Callimachus we see, though it suited not the majesty of Juno nor the wisdom of Pallas to use a speculum before they exhibited their persons to Paris, who was to determine the prize of beauty, that Venus, on the same occasion, had frequent recourse to one before she could adjust her locks to her own satisfaction. The most ancient account we have of the use of specula is that in Exodus xxxviii. 8:—"And he made the laver of brass [copper, or a mixture of copper and tin] and the foot of it of brass of the looking-glasses of the women." The English reader may wonder how a vessel of brass could be made out of looking-glasses; the Hebrew word might properly be rendered by specula or metallic mirrors. The Jewish women were, probably, presented with these mirrors, as they were with other articles of value by their Egyptian neighbours when they left the country, for it was the custom of the Egyptians when they went to their temples to carry a mirror in their left hand. It is remarkable that the Peruvians, who had so many customs in common with the Egyptians, were very fond also of mirrors, which they ordinarily formed of a sort of lava that bore a fine polish. Pliny says that the best specula were anciently made at Brundisium of copper and tin; that Praxiteles, in the time of Pompey the Great, was the first who made one of silver, but that silver ones were in his time become so common that they were used even by the maid-servants. The metallic mixture of tin and copper was known long before the age of Pliny; it is mentioned by Aristotle

incidentally when he is describing a method of rendering copper white, but not by tin, and from its great utility it will probably never fall into disuse. We have ceased, indeed, since the introduction of glass mirrors, to use it in the way the ancients did; but it is still of use amongst us, since the specula of reflecting telescopes are commonly made of it.

Greek Coins.

No estimation of the merits of the coinage of any place can be made from its reputation in the arts. Dodwell, speaking of the great reputation of Sicily at a very early period in sculpture and painting, says:—"I was surprised to find that amongst the great numbers of silver and copper coins which I procured at this place there was not one of fine execution. The same remark may be made of Athens at the time in which the fine arts had attained the highest pitch of excellence and perfection. The same was the case with Corinth and Argos, of which cities very few coins of fine style have been found. On the other hand, Epiros, Acarnania, the Locri Opuntii, and several places, in Arcadia, as Basilis, Stympthalos and Pheneos, which appear never to have been particularly famed for the knowledge of the fine arts, produced medals of the grandest style and in the most refined taste." Of course, these coins were not executed by natives. None of the ancient coins, says Payne Knight, are at all comparable in execution to the large silver coins of Syracuse, with a head of Ceres or Proserpine on the one side, and a chariot with four horses abreast driven by a Victory on the other, commonly called Syracusan medagions. Greek artists were usually employed on the Roman dies, but the ancients, having no puncheons or matrices were forced to engrave many dies for the same coin.

GENERAL.

The Paintings which were purchased from the Six collection, Amsterdam, by an English amateur, are a *View on the Merwede, near Dordrecht*, by A. Cuyt; a *Music Lesson*, by Von der Borch; and a *Young Woman at a Window*, by Gerard Dow. There is much indignation in Holland at the proposal to remove them.

The Earl of Northbrook has presented the Winchester Museum with a full-size copy of the colossal marble bust of *Jupiter Serapis*, a mongrel divinity that was derived from Egypt.

The Exhibition of the Société Nationale des Beaux-Arts is likely to be held next year in a building on the site of the Pavillon Chinois, in the Bois de Boulogne, as the Champ-de-Mars will be in the hands of the contractors for the International Exhibition of 1900.

Admiral Reveillière has proposed the transportation of the colossal menhir of Locmariaquer to Paris to form one of the attractions of the Exhibition of 1900. The people of Morbihan are opposed to the scheme.

The Mosaics of St. Paul and Dean Colet in the large hall of St. Paul's School, Hammersmith, will be unveiled on Monday next.

The Exhibition of the Society of Portrait Painters in the Grafton Galleries will be opened on the 23rd inst.

Mr. D. P. Sellar, chairman of the London Tramways Company, has offered to the Lord Mayor for the Guildhall Gallery about 200 paintings by Dutch, Italian and English masters. They are to be examined by Sir E. T. Poynter, P.R.A., on November 2.

Liège Cathedral was on Saturday last in a dangerous condition, as the timbers of the roof were burning, but although much damage was suffered the building is safe. It was erected between 1280 and 1340.

The Pope has had prepared for presentation to the rulers of various countries a series of photographic reproductions of the frescoes by Pinturicchio in the Borgia tower of the Vatican. The description is by Father Ehrle, S.J., and Mr. Stevenson, the director of the Museum of Coins.

Nineteen Antique Statues, more or less mutilated, have been unearthed in the excavations at Martres, Toulouse.

A Model of a colossal statue of *Liberty*—a woman brandishing a tree in one hand—has been erected in the Panthéon, Paris. It is the work of M. Falguière, and has not satisfied the critics.

The Directors of the London and Lancashire Fire Insurance Company have declared an interim dividend of 4s. per share (against 3s. per share last year), payable on November 3, 1897.

Messrs. Scamell & Colyer, consulting brewers' engineers and architects, of No. 18 Great George Street, Westminster, have removed their offices to 14 Victoria Street, Westminster, where all communications should in future be addressed.

The Architect.

THE WEEK.

THE spring exhibition in the Walker Art Gallery, Liverpool, will have interest for all our readers. As the Liverpool Architectural Society will attain its half century, there will be special rooms assigned to architectural drawings and designs for applied art. It is intended that the arts and crafts shall be exemplified as fully as possible, and also etchings, mezzotints, engravings, &c. In addition, photographic art and appliances will be represented. The exhibition will be open during February, March and April. All drawings and other objects for exhibition must be delivered between Monday, January 10, and Wednesday, January 12, 1898, both inclusive. Forms and other information can be obtained on application to the curator of the Walker Art Gallery, Mr. CHARLES DYALL.

THE Queen's Bench Division will on Tuesday next (assuming all the judges have not resigned by that time) consider a point which has interest for district surveyors as well as the owners of "dangerous structures." In one case the officers of the County Council were unable to discover the owner, and as the statutory notice could not be personally served it was affixed to the building. Section 196 of the Building Act of 1894 says:—"Where any consent is required to be given, any notice to be served, or any other thing to be done by, on, or to any owner in pursuance of this Act, if there is no owner, or if any such owner cannot be found, the Judge of the County Court may give such consent, or do, or cause to be done, such thing, on such terms and conditions as he may think fit, and may dispense with the service of any notice which would otherwise be required to be served." Mr. MEAD, the magistrate, however, considered that the notice must be served personally and dismissed the summons. If that view were right, it would be impossible to carry out the Act in all cases of dangerous structures where the owners could not be ascertained. The County Council accordingly have applied for a *mandamus* calling on the magistrate to show cause why he should not hear the case, and the rule is returnable on Tuesday next.

THE Housing of the Working Classes Act of 1890 was intended to promote sanitation, but it has had a contrary effect. Under the Act of 1868 local authorities had placed in their hands entirely the power of closing insanitary dwellings and ordering their demolition. The procedure under this Act was very simple and effective. But the Act of 1890 entrusted the making of the ultimate order for the closing of such houses to the hands of the justices. The ostensible reason for this was that the change of authority would tend to expedite the work and avoid the delays of giving notice and making reports. But under that Act the power was simply a power to close the condemned property and not to demolish it, and as a matter of practice it was found that this closing of property was made by the justices a question of vested interest. Before they would make an order they required that it should be shown that the property was of a poor character and low rental, and occupied by persons of limited means. It is hardly fair that the rights of the owner and the mortgagee should be swept away without compensation, and the Act offered no compensation. What is desirable is that the local authority should have a right of appeal in proceedings under section 32 of the Act, in which the justices decline to make a closing order, similar to the right of appeal by the owner of property against an order of the justices.

THE late FRANCIS TURNER PALGRAVE contributed several articles on art and literature to newspapers and periodicals. His reputation, however, was based on his compilation of the "Golden Treasury of English Songs." In 1862 he was probably the best abused writer in England. Mr. PALGRAVE was commissioned to write introductions to the different sections of the art catalogue of the International Exhibition. The articles were reprinted as a handbook and "sold within the building under the sanction of Her Majesty's Commissioners." There was plain speaking in it, but the praise as well as the blame was occasionally unmeasured. One of Mr.

PALGRAVE's favourites was Mr. WOOLNER, the sculptor. His busts were said, by force of the life that is in them, to carry us to other regions than art, and his *Constance and Arthur* was described as having a "harmony and charm of line which might have moved the envy of RAPHAEL or LEONARDO." It was discovered that Mr. PALGRAVE lived in Mr. WOOLNER's house, and his criticism of the sculptor's work was treated as if it were a puff which served instead of rent. The Commissioners were compelled to withdraw their sanction of the obnoxious handbook, and most people at the time approved of their action. Anyone who will read the handbook now will wonder at the outcry which was inspired by one of those epidemics of severe virtue to which English people are liable.

THE allotment of space in the Paris International Exhibition of 1900 is unsatisfactory for other countries besides Great Britain. The United States claimed 100,000 square metres and has had to be content with 13,000 metres, an area which is said to nearly correspond with that offered to Germany as well as Great Britain. Germany applied for 100,000 metres; Russia requires 120,000 metres. It is now manifest that the ground which is to be occupied by exhibition buildings is too circumscribed. It is not easy to discover sites which can be added. The visitors have also to be considered, and as at present planned the exhibition of 1900 will impose a strain on all who care to examine all the stalls.

IT is risky for an architect to meddle with promotion business unless he has a guarantee in writing from somebody that his expenses are to be paid. The case *BROWN v. PONTING*, which was heard on Wednesday before Mr. Justice BIGHAM, suggests that the common belief has found its way into the Courts, and every one who is connected with 'the floating of a company' is supposed to be a speculator. Kensington is now undergoing transformation, and a long line of shops will soon supplant the private houses in High Street. The plaintiff was engaged in one of the projects, and he sought to recover 400*l.* for drawing plans for the extension of the defendant's premises; 100*l.* for plans for rebuilding the defendant's premises; 105*l.* for work done for the defendant in respect of negotiations for the purchase of certain vacant land belonging to the Midland Railway Company in Wright's Lane, at the back of the defendant's premises; 105*l.* for work done on behalf of the defendant in connection with the promotion of a company which was to be formed for the purpose of acquiring the defendant's business and the adjacent vacant land. Sir A. W. BLOMFIELD, A.R.A., testified that the charges for plans were reasonable. The question however was, under what circumstances were they prepared? Mr. BROWN said he was introduced to the defendant by a man who is no longer living and was asked to aid him in finding a company to take over defendant's business. It was proposed to build flats on the ground in Wright's Lane, the lower part of the building being arranged as an extension of defendant's shop. But when it was found that the profits were less than was anticipated, the project fell through. The defendant said he had no thought of selling his business until he met plaintiff, and that he informed plaintiff he was not to be held responsible for any expenses. The Judge accepted defendant's version and held that Mr. BROWN did his work in expectation of payment from the promoters. Judgment was accordingly given for defendant. There might be doubt about the liability for plaintiff's services as a negotiator, but as it is not usual for men in that capacity to prepare architectural designs, it would perhaps have been more equitable if plaintiff were paid his claim for plans.

THE cost of the Technical School and Free Library at Widnes has exceeded the estimate by 2,700*l.* The amount which will have to be paid from rates is over 14,000*l.* It was to be anticipated that much grumbling would follow, but happily there will be no occasion. A letter was read at the meeting of the Town Council on Wednesday from the manager of one of the banks, announcing that he was instructed to pay the difference between the estimate and the outlay. It is hardly necessary to say that the Council agreed. There are not many towns where anonymous liberality takes the form of delivering a building committee from a scrape.

PUBLIC WORKS IN IRELAND.

IF the Irish Commissioners of Public Works were to advertise for pupils who should have "the run" of all the works which are directed from Beresford Place, Dublin, they would find many applicants and receive liberal fees. The outlay is not remarkable. In the year 1896-97 it was only 349,617*l.*, and there are contractors' offices in Westminster where a year's work is represented by at least three times that amount. But a course of public works in Ireland would possess a variety which is unattainable in England. Here we are mainly specialists, and a contractor likes to confine himself to railways or harbours, water supply or big bridges. But in construction, as in other things, Irishmen aim at versatility, and it is difficult to say what class of construction does not come under the control of the Commissioners. In their report we find mention not only of railways, harbours, waterworks, but of inland navigation, arterial drainage, post roads, parks, public buildings, fisheries, working-men's houses, schools, colleges, land improvement, tramways, ancient monuments, libraries, lunatic asylums and what not. The Commissioners do not carry out all the classes of works we have mentioned. They have workmen who find employment throughout the year, but in many cases contracts are let, and it is not certain they give less trouble to the authorities than those which are conducted under the immediate direction of the Commissioners' officers.

Apparently we ought to be grateful to the Irish people for expending the money which Parliament has voted, and to be able to circulate 349,617*l.* in the course of a year is, therefore, creditable to the Commissioners' diplomacy. In Ireland leisure is a force and must be respected. Great trouble has had to be taken, according to the report, "for the purpose of securing that when grants for the erection of schools have been sanctioned and works authorised, expenditure should not be unduly postponed by delay on the part of managers to commence building." The Commissioners congratulate themselves and the public because this year the educationalists did condescend to accept money as if it could be useful, for they announce:—"We have been able to issue to managers the entire amount, 40,000*l.*, voted by Parliament for the year 1896-97." Another example is afforded by the Queenstown Custom House. The Commissioners record their fears and hopes as follows:—"The vote for this building was not expended during the year because of the difficulty of obtaining a reasonable tender, owing to a strike amongst the carpenters in Cork, which lasted for about six months. Tenders were first called for in the early part of the financial year without producing any response from the locality. A second was almost equally unsuccessful. Ultimately, but not before the close of March, it became possible to effect a satisfactory contract, a tender was obtained, and under existing arrangements, which we have no doubt will be carried out, the works will be completed and the buildings occupied before winter." A pupil of the Commissioners would therefore have, among other advantages, opportunities in acquiring skill in diplomacy if he were allowed to negotiate with school managers and workmen.

But while we sympathise with the Commissioners in their endeavours to have work executed, it is impossible not to feel dissatisfaction when we find they have the hardihood to undertake decoration. The report announces, for instance, that "for the first time since its completion by GANDON in 1796 the great hall of the Four Courts has been redecorated, the original tints being reproduced as far as possible." What must have been the state of the hall with a century's dust adhering to the walls and dome we can imagine, but we doubt if its appearance suffered more from the official neglect than from the official adornment. The throne-room in Dublin Castle has also been "decorated" by the Commissioners, and in the old Royal Hospital, Kilmainham, which is the Dublin Horse Guards, "the coved plaster ceiling of the chapel, an elaborate work in high relief, has been repaired and decorated." In all such cases it should be incumbent on the Commissioners to obtain a certificate from a Dublin architect that the money expended on decoration was not wasted.

Although a large sum has been expended on building works, it cannot be said that any one of them is of archi-

tectural importance. A parcels post-office was commenced about a year ago in Belfast, which is supported on 240 piles, having an average depth of 33 feet 9 inches. But the most interesting building is one which is out of place in the Commissioners' report, for not a penny of public money was spent in its erection. We refer to the building of the Students' Union, attached to Queen's College, Belfast. It cost 8,000*l.*, which was obtained from past and present students and their friends.

Two thousand years have rolled over the cabin of the Irish peasant without bringing any change, said TOM MOORE, the poet. But since he lived it has been recognised that it is not an advantage for a country when human beings are treated like swine. The Commissioners can lend money at 3½ per cent. to boards of guardians and 3¼ to landowners and tenant-farmers who wish to erect labourers' cottages. It is also possible to obtain money for housing the working-classes in towns at a nearly similar rate of interest. The loans sanctioned on the security of the undertakings in thirty years amount to 790,949*l.*, those on the security of the land amount to 357,079*l.*, while the loans secured on rates amount to 1,636,222*l.*, or, according to another statement, 1,855,299*l.* We give the figures with some hesitation, for the abstracts of accounts are not as well adapted for reference as those relating to English offices. It is evident, however, that enough money was expended to make a sensible difference in the character of the labourers' cottages.

The number of "castles" in Ireland would appear to be countless. The majority of them would not, however, give much trouble to besiegers. In order to enable owners to put those habitations into decent repair Acts were passed in the years 1870, 1871, 1882 and 1890. But it was contemplated that the loans should be obtained from private sources. But as the charge under those Acts does not take priority over mortgages or other encumbrances affecting the land and already existing, there is not apparently much work for builders created by the Limited Owners' Residences Acts.

One of the reasons advanced in support of a separate legislature for Ireland is the heavy expenditure which is necessary to obtain an Act in London authorising a railway to be constructed. By the Railways (Ireland) Act of last year a more economical procedure is authorised in the case of poor districts. All that is henceforth necessary is a certificate from the Lord-Lieutenant stating that the proposed line is necessary for the development of the district through which it passes. The Treasury is, moreover, empowered to give aid towards the cost of construction provided some existing railway company agrees to construct, work and maintain the proposed line, or to work and maintain it after construction. It is expected that the land required has been given without cost. The Commissioners of Public Works are to examine the plans, and in "congested districts" can undertake the construction of the line if a railway company is not available. An extension of the Act, in order to make it applicable to various classes of works, would be advantageous to Ireland, although there might be an interference with the privileges of the Parliamentary Bar.

The Commissioners have had several ancient monuments under their protection and several others are being acquired. Sir THOMAS DEANE, R.H.A., who has charge as superintendent of the ruins, supplies the following report of the year's work:—

Castledermott, co. Kildare.—This abbey was founded by St. Diermitt within the first century after the introduction of Christianity into Ireland. Nothing remains of the ancient structure. The building of which the remains exist was erected about 1260 A.D. The style is Early Decorated and includes a long nave transept with three side chapels. The tracery of the transept window has fallen and the remains have disappeared. There are traces of an aisle between the transept and the western end. Repairs which substantially secure the ruin from decay were executed during the year, and some further work will probably be considered desirable at a future time.

Askeaton Castle, co. Limerick.—This monument, which was the great seat of the Desmonds, is situated on the river Deel. There are considerable remains of the banqueting hall, including traceried windows at either side. The keep is of great height, but much dilapidated. The embattled wall of the castle is almost perfect. Works of a preservative character have been carried out and the ruin is now in a safe condition.

Askeaton Abbey, co. Limerick.—This ruin is situated also on the banks of the Deel. Perhaps it is one of the most

interesting abbeys in Ireland, having still complete cloisters, conventual buildings, refectory, &c. There is a fine eastern window, with remains of sedilia, and the arcading of the eastern wall is preserved. This arcading is of the same character as that in Ennis Abbey, and its features would lead to the conclusion that the same hands worked at it. James, the seventh Earl of Desmond, founded the abbey, A.D. 1420, for Conventual Franciscans. It was reformed for Observantine Friars in 1490. The works necessary for preservation were carried out during the year.

Ruins on Devenish Island, co. Fermanagh.—These monuments were vested in the Board in 1880 and works of preservation executed. In the course of the year the abbey and round tower were struck by lightning, which led to the necessity of considerable outlay on repairs. The superintendent of national monuments availed himself of a scaffolding to the tower which was erected in connection with the repairs, to have casts taken of some curious carved bands which surround the top. The casts have been deposited in the Science and Art Museum.

Dunbrody, co. Wexford.—Some work, in addition to that carried out in 1895-96, was carried out during the year under report. There still remain some few items to be dealt with, and it is proposed that these shall be attended to during the present year.

Slane Abbey, co. Meath.—The works here, which were commenced in 1895-96, have been completed satisfactorily.

Clare Island, co. Mayo.—Certain minor works of maintenance have been executed.

New Grange, co. Meath.—It has been found necessary to expend a small sum on the maintenance of this monument during the year.

Roscommon Castle, co. Roscommon.—Considerable repairs have been carried out on this important monument.

There is much else in the report which deserves attention, for in variety it surpasses any document issued by that monopolising body, the London County Council. But enough has been said to suggest that Ireland is receiving attention and aid from the Imperial Government, and if improvements are not realised the cause must not be ascribed to official neglect.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of this Association was held on Friday evening last, Mr. Hampden W. Pratt, president, in the chair.

The following gentlemen were elected members:—Messrs. C. E. Abercrombie, S. J. Tatchell, H. W. Fitchett, H. M. Nisbett, J. H. Cammack, G. Trotman, C. H. B. Pinchard, W. H. Collin, P. B. Dannatt, A. G. Dorrell, L. de Senna Fernandes, E. M. Thomas, H. C. Fread, S. H. Goodwin, O. O. Harrison, H. J. Ingram, C. M. Inman, B. J. McAdam, C. E. Okely, A. W. Papworth, F. E. Ravenscroft, A. H. Rowe, H. Y. Smallwood, W. F. Wilkie, E. L. Wratten, M. D. Barton, A. R. Conder, R. G. Ell, A. Foxley, G. J. F. Hookway, Max Judge, A. R. Keighley, A. V. Kislingbury, W. M. Settle, W. A. Jeckells, P. J. Westwood, L. I. Wood, E. M. Joseph, R. Hosking, H. Macintosh, C. H. Reilly, G. Church, H. E. Rider, D. J. Fyfe, J. A. Swan and H. S. de B. Lopez.

The Chairman announced that the first stonework demonstration would be held on November 2 in the Regent Street Polytechnic. These demonstrations had been arranged by the Technical Education Board, and were free to all members of the class of design.

Mr. Edwin O. Sachs then read his paper on

Lessons from the Paris Charity Bazaar Fire.

The author began with a description of the terrible fire in the Rue Jean Goujon on May 4. Although there were about 124 deaths in forty-eight hours, say three days at the utmost, the fire was forgotten, exactly as was the case with the Vienna "Ring" Theatre fire of 1881, with its 450 fatalities; with the Opéra-Comique fire in 1887, with a death-roll of 115, and other great catastrophes. Even when the Exeter theatre was burnt down in 1887, and 160 lives were lost not many miles from this Metropolis, the country forgot all about it within a week. The paper was prepared because it was believed that the architect, the surveyor, often assisted by the civil engineer, can do far more in minimising the loss of life than any law or regulation. But the theatre architect, when fighting against some long list of requisitions, is proud when he can point out to the lessee, "I have saved you that exit; I have saved you that reduction of seats," and maybe he also thinks of the extra fee, but certainly he never—any more than the architect with the factory case—gives a thought to the lives of those who enter the building on which he has advised. The client very seldom wishes to oppose the legitimate requirements of the authorities, or at least not until the architect has told him of all the savings

he will try to effect by avoiding the regulations and requirements. Every factory owner knows what a fire would mean for his business, no matter how well insured he may be; every theatre owner and manager knows his responsibility well and knows that the audience of to-day wishes to feel safe when taking their amusement. The opposition of 1897 mainly emanates from the architect. Mr. Sachs next considered the arrangements of the Charity Bazaar.

The plan of the building shows a long gallery constructed of a series of framed trusses, the whole of the work being in timber. All the walls were match-lined on both sides. The roof was partly covered with tarred felt and partly with glass. The total cost of the structure was about 12,000 francs, or about 480*l.*, of which sum nearly half was spent on the materials employed. The contractor carried out the work with particular regard to economy; and hence, perhaps, the lightness of the materials. So far as the contractor was concerned, the building appears to have been considered of a private character, little or no supervision apparently being exercised

by any of the local authorities. The principal entry was through two doors placed centrally, No. 1 and No. 2, and the visitors passed through a small vestibule and inner lobby in each case. There were four additional exits at the back, Nos. 3, 4, 5 and 6, of which No. 3 alone seems to have been well known, owing to its forming the approach to the cinematographe annexe. There was another exit, No. 7, used for service purposes, with which only the management and the stall-holders were acquainted, and there was also a small door from the refreshment annexe, No. 8, into the open. In the front of the building there were several windows to the office, the ladies' room, &c.

On both sides of the gallery there were rows of stalls, and the construction of these, together with the section of the building, is shown in the diagram I have had specially prepared from the working drawings in the hands of the contractor. The frontages of these stalls were faced with scenery, whilst the top of the hall was closed in by a velum of canvas. The decorations were elaborate, and, I must again add, particularly inflammable, whilst the articles for sale on the stalls were, of course, of a similarly dangerous character. Perhaps I should also mention that the decorations to the stalls were old, worn and very dry. The floor was of wood, resting on timber sleepers. On the exteriors the only attempt at decoration had been in the central feature.

There is no doubt that the fire originated in the cinematographe annexe, and the actual cause was due to carelessness in using the special lamp employed, but I will not go into detail

on the point of the actual cause of the outbreak, as this would not teach us much and only afford another instance of the criminal recklessness with which mineral oils and explosives are handled. It appears that the flames at once broke through to the gallery, and were drawn immediately across the hall to entrance No. 1. It will be seen from the drawings that the glass at the top of the building must have been broken

almost immediately through the enormous velum becoming a sheet of fire. Further, it is evident that the velum must have broken away from the points at which it was hung, falling on those beneath it. The tar on the roof also dropped in a molten or burning state. The plan will explain how those farthest away from the centre on the cinematographe side of the building must have been cut off directly the flames took a hold of the doors No. 3 and No. 1. It was further natural that there should then be a general stampede towards entrance No. 2, and to that part of the hall farthest from the cinematographe. The extra doors, No. 5 and No. 6, were apparently so little known that they were not used, and it appears that many of the visitors were caught at the entrance to the store annexe, which I have already stated was then serving as a cloak-room, and hence well known to many of the ladies, who, in the excitement of the moment must have associated it with an exit.

It is not my purpose to discuss the plan in detail, but there is one thing certain, and that is that at first sight the number of exits, eight in all, would appear sufficient for a substantially built structure which has its floor on ground level. I would even go so far as to say that there are not many galleries of the same dimensions, standing under the control of a public authority in this country, that have a larger number of exits; but here it should not be forgotten that in the planning of places of public entertainment precautions are not based on the assumption that flames will spread with such rapidity as was the case among the decorations, fittings and general appliances of this fatal structure. In a well-planned theatre of the most modern type there is always the supposition that some four or five minutes' time will be given to the audience to leave their seats in the auditorium proper. There is one unfortunate

feature of the planning of the Paris Bazaar I cannot, however, help noticing, and that is the manner in which the lobbies to entrances Nos. 1 and 2 were set out with the view of excluding draughts. I am unable to get reliable information if the wings to these doors swung outwards. As to the doors Nos. 3, 4, 5, 6, however, I know that they opened inwards and that one of them was blocked or bolted at the time of the catastrophe. The author then treated the subject of

Fire Prevention of To-day.

He said:—Now, gentlemen, if I may be allowed to classify, the Paris Charity Bazaar was a semi-public entertainment held in a provisional building. As you know, our entertainments are either of a private character, of a semi-public or of a public character, whilst the buildings utilised are either permanent structures specially erected for a specific purpose, permanent structures temporarily adapted for some such purpose, or they are provisional buildings.

Safety at Public Entertainments.

As far as public entertainments in buildings specially erected for the purpose are concerned, nearly every country has already inaugurated some policy for preventing catastrophes. I here speak of the theatre, the music-hall, the assembly-room, &c. Europe has, in fact, every kind of legislation conceivable for the protection of the public in this class of structure. There have been hysterical panic legislation, ponderous regulations in which every detail is defined by law, also codes which leave practically everything at the discretion of an executive of experts, and regulations which are merely so by name and are a farce because they cannot be put into force. There is no uniformity in the preventative legislation of the world, even in its elementary principles. If we study the regulations of different countries consecutively with an idea of discovering what is really necessary, the result is most confusing. Now, I am not going into detail. Don't be afraid; I shall not quote clauses. But for all that, I will say broadly that some countries seem to consider that good construction is the essence of safety, whilst clear planning, watching and inspection are forgotten. Other countries give all attention to endless regular inspection and omit the watching; others, again, require inspection only; whilst others, perhaps, insist on good planning, construction and ample inspection, but disregard the watching. It is time for some representative body of experts to decide what they consider necessary in the interests of the public. I am not going to raise the many questions as to the proper executive for locally determining or enforcing the requirements, nor shall I enter into the merits of individual regulations. I will simply call your attention to the want of uniformity in the main and elementary principles for obtaining safety where we have to deal with buildings erected for specific purposes and where specific forms of entertainment are given.

Personally, I hold that for a theatre or music-hall clear planning is of greater importance to the audience than clever forms of construction, or the employment of materials having considerable power of fire resistance; and further, I contend that in such buildings the regular attendance of fire watches day and night, and more especially during performances, is more essential than any amount of regular or even surprise inspection. But remember this is only a personal opinion. There are no definite conclusions as yet arrived at by any body of experts representing the conflicting interests which play such a prominent rôle where our public entertainments are concerned.

In expressing my opinion on the matter, I should, perhaps, say at once that I consider it the duty of the authorities to attend to the protection of life in the first place, and to the protection of property in the second. As we all know how easily a panic occurs without any fire, and how dangerous the rush of a frightened audience can be, the clear exit of ample dimensions and most direct route will be the greatest safeguard against loss of life, and perfect symmetry of plan of very great value. The prevention of a cause for panic is best guarded against by the constant presence of experienced and responsible firemen, who will on the one side recognise the possibilities of danger in time to prevent a fire, and on the other be able to act smartly in case of an outbreak. I do not wish to disparage good construction, or regular and surprise inspections; but I consider the most careful regulations as to construction and materials are of little practical value, so far as the safety of the audience is concerned, if at the same time the planning is not straightforward; and responsible firemen are not regularly in attendance. To take an extreme case, wood stairs will take the audience quite as quickly into the open as stone ones, and stone stairs with many winders and a complicated plan will be far more dangerous than wooden ones of straight flights of, say, fourteen steps each. Don't let me be misunderstood; of course good construction and fire-resisting materials lessen the risk of an outbreak of fire, and I shall always advocate such construction and materials. But I have inspected many theatres, built of slow combustion materials, and yet have found them dangerous in the extreme through bad planning, and I wish to

point out that a building erected entirely of fire-resisting materials is not necessarily the safest. It is also on account of my acquaintance with the fact that many important cities, though equipped with modern regulations for the erection of theatres, have no powers to enforce the presence of an official fire-watch during the performances, that I am anxious to lay stress on the necessity of watching, and not only inspecting, the theatre and music-hall of to-day.

Preventative Means at Semi-public and Private Functions.

All that I have said so far refers to the permanent building erected for a specific public entertainment, and even here, with given facts, I have to tender personal opinion because we have not yet arrived at definite conclusions on the subject. What, may I ask, is the state of affairs as to semi-public and private entertainments in buildings, halls or rooms temporarily utilised for gatherings of this description? Why, so far nothing whatever scarcely has been essayed, let alone decided. Legislation on the subject in this country is as non-existent as it is on the Continent. Why, we have not even as yet any practical definition as to what a private or a semi-private entertainment is. The whole subject is so delicate that even such despotic police administrations as those of Prussia and Russia have not yet felt their way. Where do the privileges of private entertainment cease, and when does an entertainment assume a public character, not only as such, but more especially in respect to public safety? Cannot every man do exactly what he pleases on his own property so far as entertainment is concerned, and as long as the general public is not admitted by payment? But is not a Foreign Office reception on Her Majesty's birthday in reality, to all intents and purposes, a public entertainment, and similarly the ladies' political drawing-room meeting in Park Lane? Is not a bazaar held in a tent, say, at the Botanical Gardens, and to which only members of the society with their friends are admitted, a public entertainment? How many bazaars, let me ask, are held without payment for admission on private property which are essentially of a public character? Think of the many meetings, so-called private theatricals, subscription balls and other fêtes. How is classification to be attempted? How are we to define our entertainments? But is it necessary to classify at all? Is it essential to make limitations as to the different classes of our entertainments? I think not. Whilst most of our legislators at home and abroad are trying to define our entertainments and then to frame certain requirements for the safety of the public, why not let the character of the entertainment take care of itself? Let us look on every room over a given size as a place in which we may or may not congregate, with or without payment, to dance, to sing, to let others sing and dance, just as the case may be. Let the superficial area of any given room and its position alone govern our requirements for safety; not the fact that it is a private dwelling house, a saloon at an inn, a schoolroom or a board-room.

If the Building Act of to-day defines the thickness of a party wall and its height above the roof, quite independent of the fact of a man giving a party, or lending his house for a drawing-room meeting, having a chemical laboratory in the place, dancing classes, or a school, why should there not be such planning compulsory as to prevent any room over a given size, be it a ball-room or a studio, being used without risk to life? Why should not every large drawing-room on the first floor have sufficient exit and staircase accommodation to deal with the maximum number of people who press into that drawing-room? And let the same hold good for every class of structure, if a public house, a schoolroom, or a chapel. Do we not all know the bazaars held in houses kindly lent by charitable owners? I have a house in mind in Carlton Terrace where the first floor drawing-rooms are at times simply packed, and the staircases so crowded that it takes a full half-hour to get from one floor to another. The function was essentially a semi-public character, and as dangerous a one as I can remember. You all know the entertainment in the parish schoolroom, given ostensibly by the schoolmaster to the friends of the pupils. Well, again, don't let us bother too much as to the exact purpose of any gathering, but let us build our larger rooms so as to allow for assemblies of any description, with safe and speedy exit in case of need.

But how are we to assure ourselves that even if any one room or hall fulfils the ordinary requirements of safety as far as plan and construction are concerned, that the variations in the interior arrangement, in the decoration, &c., do not more than annul what the architect has done? Of course a building, a room, or a temporary structure should be used for what it is designed and for no other purpose. But in reality we must consider the possible purposes to which a room may be put, in fact, the dangers of any decorations or paraphernalia necessary for the fulfilment of various objects must be considered at the time of construction. A hall which is used as a ball-room and which is perfectly safe as such, may be a veritable mouse-trap when used for theatrical entertainments. A hall designed only for banquets, public dinners, &c., may become dangerous

when utilised for bazaars, with all the temporary stalls and side shows. The building must be designed to fulfil conditions of the greatest possible danger. Of course many hold that we cannot limit ourselves to controlling the erection of buildings, but we must seek to obtain control over the employment and the manner in which they are equipped for its different purposes. No doubt it is just the ordinary drawing-room, the ordinary assembly-room, the schoolroom, &c., which is used for so many purposes for which it is never intended, and that there are many dangers incurred on that account. Such control has been attempted in some continental countries. But I think such control would be very hateful in these freer isles. We would, I am sure, rather build our houses and halls at once in such a manner as to be prepared for all risks rather than be constantly worried by inspections and the like. What may be good for a continental country is not suitable for us. We all abominate anything like perpetual grandmotherly interference. Hence, I say, rather let us at once build suitably for all emergencies. If we do that we need not be constantly worried. Perhaps even improvement of plan and construction at the outset in a new building appears a very serious matter to you, but think, what does it really mean in nine cases out of ten? A few extra doors, and these so hung as to swing outwards; staircases perhaps somewhat broader and not of a dangerous hanging type; handrails perhaps on both sides; a few safety bolts or latches. Surely this would not even interfere with a great art-architect's design, his colour scheme or details, and would this not save us endless worries of control over all private and semi-public entertainments?

Unsuitable Provisional Buildings.

And now comes the question of provisional buildings erected for some specific purpose, such as a bazaar, and often allowed to remain in position for some indefinite period. Again we find nothing has so far been done or decided so as to minimise danger in these structures—in fact, the meaning of a temporary structure has scarcely been defined. Is the large tent built in the garden of a private residence or on some verandah a temporary structure or not in the meaning of the Act, and if so, why are such tents erected with impunity for all manner of social functions throughout the London "season"? To my mind the less temporary structures are encouraged the better, and this no matter what their character or purpose. But when erected, let the same importance as to planning and watching be accorded to the provisional building as is essential for a permanent structure. Let us also remember the Charity Bazaar fire, and let us consistently avoid the flimsy and dangerous materials used for its construction. Why, we can even have temporary iron buildings at a very reasonable expense. But above all, planning and watching should be kept strictly in mind. I am not going into details this evening, but if you wish to have some valuable information as to what can be done and what the architect should bear in mind when associated with a temporary building, I cannot do better than refer you to an article by an old friend of the Association, Mr. H. Heathcote Statham, and published in the *Engineering Magazine* of July last.

Dangerous Decorations.

It is not my object, as I have said, here to deal with details, neither in regard to the construction of our permanent theatres or public halls, our private drawing-rooms and our temporary buildings. The diagrams of the temporary structure at Paris, to repeat what I have said, serve as sufficient warning as to what must be avoided in this direction. It is likewise not my wish to enter into details on the question of equipment, for here again the diagrams will show everything that is to be condemned. There is so far, I am aware, little or no regulation as regards such equipment of to-day. The matter has, in fact, scarcely ever been discussed, though an all-important one as far as safety of life is concerned. I do not wish to air personal opinions on the subject of equipment, for it would take a long time to explain the possibilities, probabilities, &c., of the question. If I may be allowed to call attention to any one thing, it is, however, to the fact that whatever the architect may do in any class of building used for entertainment, his efforts can so easily be annulled by flimsy decorations, appointments, equipment, &c.; it is just this so-called decoration combined with carelessness on the part of the individual that is the actual cause of most fires. Apart from facilitating the escape of the individual, the architect's efforts are to a great extent limited, as far as the actual fire is concerned, first, to avoiding the possibility of an outbreak occurring in connection with the structure proper, and, secondly, seeing that should an outbreak occur his structure does not facilitate its spread. The architect cannot prevent a drawing-room or a schoolroom, being decorated with bunting, Liberty silk or paper rosettes, and, as I have said, control in these matters would probably not be advisable in England. He cannot prevent the smoker "lighting up" at his smoking concert or prevent the use of open lights, and official interference in such matters would be unacceptable to the average English-

man. We can no doubt prevent many dangers in the usage of buildings erected for public entertainments. We could and should prohibit the wood stage of the theatre, we can prevent muslin hangings being used in the auditorium, and allow smoking only in specified rooms. But such restrictions would be intolerable and extreme if applied to rooms used for private and semi-public gatherings. It would not be practicable. Thus again, remember, we have to deal with certain well-known possibilities of fire with certain given facts, and for these facts you have to provide. The actual disuse of those Liberty silks, open lights, muslin, paper roses in our private and semi-public entertainments rests entirely with the good sense of the general public. Until the general public boycott them, you will have to take them into account when you are at your drawing-board or superintending your jobs.

Conclusion.

And now what is to be the remedy for the present state of affairs regarding safety of life at entertainments and gatherings of different descriptions?

The first and principal remedy to my mind, as I have already indicated, lies in your hands, as representatives of the architectural profession. It will be the architect mainly to whom we shall have to look for safety—we have to rely on the spirit with which he designs his structure, no matter what the regulations may be. At present, I am afraid safety of life is about the last thing that the designer thinks of. Safe planning and fire-resisting construction will have to become subjects in the student's curriculum, and the practitioner of to-day must have his attention called to these matters.

Secondly, we must depend largely for improved protection on the general public, who will to a great extent sooner or later have to take upon themselves the rôle of being their own guardians. At present there is not the slightest interest in this country in the question of protection from fire, whether it be in connection with our entertainments, or with the fire losses generally. That interest will have to be awakened. The public will have to call for protection, and will have to give protection from fire the same amount of attention which is accorded to safety in travelling, safety of health through sanitation, and safety from social disturbance through police supervision. Whilst the architects on the one hand will be acting as experts and giving the British public safer buildings, that British public will in time see that these buildings are employed for what they were originally intended, and that no unsuitable decoration or equipment is permitted. Such gross mistakes as are now being constantly made will, if I may say so, some day be instinctively avoided.

Thirdly, architects and public opinion will have to be supported, their hands strengthened or governed as the case may be by further legislation, giving the necessary powers to those in authority to intervene where necessary, and laying down the principles that have to be followed; and with new legislation, we should also remember that we shall require more officials who will in every way be capable of carrying out its administration, and the execution of any specific code with tact, knowledge and sound common sense. Legislation on building matters always requires a certain power of discretion for the officials. We do not want the red-tape automaton so conspicuous in some of the continental countries.

But how are these remedies to be brought about? Of course there is always a considerable literature forthcoming on a subject of this description after every catastrophe. We have had literature enough after former fires, but unfortunately, except for the steps already taken as to theatres and licensed premises both at home and abroad, it has been literature alone. There has been much writing, but very little action. It is now time to take action. We do not wish London to be the scene of a calamity similar to that by which Paris has been recently visited.

How are we to get the architect in practice to take a little interest in fire protection, not only in its general aspect, but specially in connection with our entertainments? How is the student to be encouraged to take the matter up? How, again, is the general public not only to be interested but educated? How are our authorities to be assisted in arriving at practical conclusions and regulations, and our officials kept in touch with what is going on in these matters?

It is a big question, gentlemen, for I go so far as to say that in regard to the general public we should even let the Board school "standard reader" have pretty fables dealing with the dangers of fire rather than some of the useless stories that appear to-day. Don't think I am proposing anything new. Sweden has long utilised its "standard reader" for impressing matters of importance on the rising generation. We all remember our fables. Surely they would impress on our minds such things as the danger of throwing matches about? I go further still and say that the public press, that great educational factor of to-day, might be induced to give us something more instructive about fires than mere reports of conflagrations, the

efforts of our gallant firemen and the exact number of feet of hose that are taken to a large fire. We might hear more of the origin of fires and the possibilities of prevention.

How are we to attain these improvements? Well, gentlemen, to my mind the right note has been struck at Paris. It has said:—"Call together your leading architects and surveyors, your civil and mechanical engineers, your experts in chemical and other sciences. Call together your leading officials, the leading Government and municipal workers and others seriously and scientifically interested in the technical and economical problems of to-day. Don't forget the leading fire-brigade officers nor the owners of warehouses, theatres and other dangerous property. Combine the many conflicting interests. Don't be afraid of compromise. Avoid one-sidedness. Examine what has so far been done at home and elsewhere. Find out what proposals are stowed away in men's minds. Confer. Then act, and act soon. But mind, no one-sidedness or petty prejudices." That is the advice from Paris, where it is being acted upon. Other countries will act on it, too, and I hope Great Britain will be foremost among them. A small start has, in fact, already been made. At the initiative from Paris a small committee has been formed which is taking up this matter of fire-prevention. This is scarcely the place to mention names, but perhaps I may say there are among the members men whom you know and admire. That committee, made up of representatives of the different interests will soon find a way to help the architect, to see that the general public does not forget the lessons of the Paris fire, and that our legislators have sound independent assistance when required. Well, gentlemen, I hope some of the prominent members of the Association will be among the first to join and help this committee, and thus show that the opposition I first spoke of is not favoured by the leaders of our profession. It is fire-prevention, mind you—preventing fires—that we have most to-day to think of—not putting the fire out when it is there. Let our gallant firemen look after the fire-fighting when the fire fiend is actually among us, but let us see that our firemen have as little work to do as possible, and that they are not handicapped to the extent they are at present.

A discussion followed, the speakers being Mr. Richard Roberts, vice-chairman of the theatres committee of the London County Council; Mr. S. G. Gamble, of the Metropolitan Fire Brigade; Major Fox, of the London Salvage Corps; Mr. T. Blashill; Captain Dyson, of the Windsor Fire Brigade; Mr. H. Lovegrove and Mr. Max. Clarke, and Mr. William Archer.

Plans and photographs were exhibited on screens.

THE OLD LIBRARY, BIRMINGHAM.

THE Birmingham Library, known better as the Old Library, seems to be in a fair way of losing its time-honoured habitation. The dingy but cosy building in Union Street, the beloved haunt of four generations and more of students and literary loungers, is threatened with destruction by the scheme for a new arcade. In these circumstances a paper on the history of the institution, read by the librarian (Mr. C. E. Scarse) at the meeting of the Library Association in London on October 22, is especially interesting. The small beginning of the library is recalled in the statement of Hutton, that "the whole stock (of books) might have been laid in a handkerchief." The institution, however, as Mr. Scarse says, has become almost part and parcel of the town, and, although it has passed through many trials and troubles, it is now at the ripe age of 118 years hale and hearty, and likely to survive the great uprooting which it is expected will take place in the spring of 1899. It was feared that when the Free Library was established in Birmingham this library would eventually become extinguished. At that date there were about nine hundred subscribers, to-day the number is considerably over two thousand. The last quarter of the eighteenth century was a period of great intellectual activity in Birmingham, and the ambition of the townsmen was for the establishment of a permanent library, in which the books that were purchased should remain, and by continued accretions ultimately grow into an important public library worthy of the town. The Birmingham Library was founded and opened in November, 1779, by nineteen subscribers. The first printed catalogue was issued in 1781 in thirty-two pages, of which fifteen were filled by the laws, twelve by the titles of books, and the rest by the names of subscribers, who had increased from nineteen to twenty-four within two years. The laws provided that every subscriber should pay a guinea entrance fee, should receive a printed ticket, numbered and signed by the president; should also pay 6s. in advance towards the expenses of the current year. Every subscriber was to have the power of transferring his share, but not of lending his ticket, or any of the books, to any person out of his own house under the

penalty of half a crown. The committee was to consist of twenty members, "each member giving the president a list, unseen by the rest, of those persons of whom he would have it (the committee) consist." . . . "Whatever expenses they shall choose to be at shall be defrayed by themselves, and not by the society." The locality of the library in 1781 is shown by the following note:—"The books are to be had of Mr. John Lee, jun., Snow Hill, the present steward and treasurer, every Monday, Wednesday and Friday morning in each week, from nine till ten o'clock, until the room which is engaged shall be ready for them, of which notice will be given in the newspapers." Mr. John Lee, jun., was a merchant and button-maker. The library two years afterwards was removed to the premises of Messrs. Pearson & Rollason, in the Swan Yard, High Street. Dr. Priestley, on his arrival in Birmingham at the end of 1780, took a great interest in the prosperity and progress of the library, and the early advertisements were written by him. For instance, *Aris's Gazette* of June 11, 1781, has the following:—

"Birmingham Library.—A general meeting of subscribers to this institution is appointed to be held on Wednesday, June 13, 1781, at the Castle Inn, in High Street, at three o'clock in the afternoon, when every subscriber is desired to attend, to consider some of the laws relative to the government of the society. This library is formed upon the plan of one that was first established at Liverpool, and which has been adopted at Manchester, Leeds and many other considerable towns in this kingdom. The books are never to be sold or distributed; and, from the nature of the institution, the library must increase till it contains all the most valuable publications in the English language; and from the easy terms of admission—viz. one guinea for entrance and six shillings annually—it will be a treasure of knowledge both to the present and succeeding ages. As all books are bought by a committee of persons annually chosen by a majority of the subscribers, and every vote is by ballot, this institution can never answer the purpose of any party, civil or religious, but on the contrary may be expected to promote a spirit of liberality and friendship among all classes of men without distinction. The library in this town is at present in its very infancy, but it already contains a valuable collection of books, catalogues of which may be always seen at Messrs. Pearson & Rollason's; and when the library room (which is already engaged in the most central part of the town) shall be opened for the reception of it, and the constant accommodation of all the subscribers, the advantages arising from the institution will be greatly increased."

The management of the library did not always exhibit that spirit of liberality and friendship which the learned doctor had anticipated, for a bitter controversy sprang up between the representatives of the Evangelical Church party and Dr. Priestley, and it is not improbable that the first of the seeds which germinated into the Birmingham riots were sown within the library walls. The librarian (Mr. William Horne), it was announced, would attend "to deliver the books every day (Sunday excepted) from two o'clock in the afternoon to five." For this duty he was paid 10*l.* a year. It was further announced that "within those hours any subscriber may see the books, read and make extracts, &c., at his pleasure. A fire will be kept in the room, and the last reviews will always lie on the table." In 1784 the reported number of volumes in the library was 900. This increased to 1,200 in 1785, and to 1,600 in 1786, when it was announced that the library was too small for its requirements. At the close of 1789 the books had increased to 3,400 volumes, and in the following year the library was removed to larger premises in the Upper Priory. The tontine system was then highly popular, and it was proposed to lease a plot of land and to erect a building on the tontine plan, a sort of lottery in which the latest survivors came into possession as the rest of those named in the deed died off. The following preliminary advertisement was issued in 1789:—

"Birmingham Library.—A subscription is opened in the library for 200 names to raise 1,000 guineas for the purpose of building a new and complete library, to be let to the society at 25*l.* per annum, on the tontine plan. Those gentlemen who wish to subscribe for one or more shares, not exceeding ten, are desired to send their names to the librarian immediately. Any person having a freehold spot of land in a central situation to dispose of is requested to send his terms in writing to Mr. Horne at the library, and any builders wishing to undertake the building may send their plan and estimate to the same. The land must be at least 200 and from that to 300 square yards."

The tontine deed was subsequently printed. It gives the names of 138 "parties" to the deed, and a list of persons nominated under each of the 181 shares. An indenture, made March 25, 1798, recites an indenture of lease made on or about June 15, 1797, between William Withering (the famous doctor and botanist) of the one part, and Thomas Cooper, Charles Twigg, James Timmins, Joseph Gibbs and John Petty Dearman of the other part; whereby "all that piece or parcel of ground of the said William Withering, situate and lying in

Birmingham aforesaid, near to a street there called Cherry Street, and then lately used as a bowling green, formerly called Corbett's Bowling Green. . . . And also that building then erecting upon the said piece or parcel of ground, and which was designed by the said parties to be used for the purpose of a public library," is leased to the said Thomas Cooper and others "for and during and unto the full end and term of 120 years, to be computed from the 24th day of June, 1793, at and under the yearly rent of 11*l.* 15*s.*, payable as is therein mentioned." The recital also mentions that the building (designed by William Hollins) cost 905*l.*, and that it shall be let to the subscribers "at the clear yearly rental of 22*l.* 12*s.* 6*d.* only, but subject, nevertheless, to the payment of the ground rent," and all other rents, taxes, repairs, &c. In 1840 the building was enlarged, the original plan being preserved and continued in the front elevation. In this year the London Library applied for information as to the constitution, laws, rules, stock and general arrangement in the Birmingham Library. In 1860 the committee's report contained the announcement that in the October previous the arrangements for the amalgamation of the new library with the Birmingham Library had been completed with most satisfactory results. The proposal to amalgamate the two institutions arose from a sudden loss of forty members, in consequence, it was believed, of the proposed adoption of the Free Libraries Act in Birmingham. The affairs of the library continued fairly satisfactory for the next sixteen years, and on March 24, 1876, the present librarian entered upon his duties. In 1877 the laws of the library were, at the suggestion of the librarian, altered so as to more clearly define the privileges of the proprietors and subscribers, and readers' tickets were issued to other members of subscribers' families at five shillings each. The overcrowding of the library by persons who had no right to enter had rendered the issue of tickets necessary, and by this method the difficulty was removed. The following year the committee reported that "the librarian had rendered a valuable service to the members by rearranging the books on a classified system, which offered great facilities for consulting the various departments of the library."

The alteration of the laws was the means of placing a value on proprietors' shares, which before then it was difficult to get accepted as gifts, and from 1878 until the present time upwards of 1,200*l.* have been received on the sale of shares which have lapsed to the library. In 1888 the laws were again altered, and additional premises were taken for an extension of the library buildings. Two large reading-rooms were added for the exclusive use of proprietors. The one for gentlemen was made a smoke-room, and for the ladies a comfortably furnished parlour was provided. The additional rent was in a very short time more than met by the additional subscriptions. At the close of 1893 the subscription list amounted to upwards of 2,000*l.* In August 1894 the electric light was installed. The possibility of an economical disposition of the lights has brought the cost down to a little below that of gas, while the saving in the matter of cleaning and painting and in the bindings of the books is very considerable. An extract from the minute book, dated December 22, 1797, will be interesting. A new "lamp iron and lamp were to be put in a convenient part to light the front of the library." Until the introduction of gas in 1832 the interior of the library was lighted by candles, and for several years after this date wax candles were used in some of the rooms.

GLASGOW ARCHITECTURAL ASSOCIATION.

THE usual monthly meeting was held in the rooms, 187 Pitt Street, on Tuesday evening, the 19th inst., at eight o'clock, when Mr. Richard Ferris read a paper entitled "Modelling in relation to Sculpture and Decoration." The lecturer began by characterising modelling as the beginning of all things, for by it the ideas were gradually developed in a tangible form, changeable at will. The model in clay or other plastic material was a necessity for anything of importance to be executed in relief, representing work as it would appear when finished, and had been employed for such different subjects as statuary, silversmith-work, and even a cake of chocolate. The essayist then touched on the many points of connection between the model and the replica in the different materials, finishing up with a selection of lantern views of models and the works executed therefrom.

The Next Ordinary Meeting of the Institution of Civil Engineers will be held on Tuesday, November 2, when a short address will be given by Sir John Wolfe Barry, K.C.B., LL.D., F.R.S., the president, and the presentation of medals and prizes awarded by the council will take place. A reception will be held by the President in the library after the meeting.

NOTES AND COMMENTS.

It has been generally supposed in this country that American architects were martyrs to their love of art, for, according to all accounts, they were not appreciated by the authorities, and private clients were not over-confident in them. Probably the condition of affairs as described owed something to American imaginativeness; but, in any case, those evil days have vanished. According to Mr. Post, who presided at the convention of American architects just held in Detroit:—"The States containing the great business centres have been so thoroughly imbued by artistic influence that in them architecture has received its proper recognition as the most exact, exacting and comprehensive of the arts, and the architect has become the accepted arbiter in all questions relating to building or decorative work. Elsewhere throughout the land, hand in hand with its material improvement, the architect advances in consideration, until it is safe to predict that the period is not far distant when north, south, east and west alike will recognise the fact that without the intervention of the skilled and thoroughly educated architect no building can be artistically successful or economic in construction; that truly artistic construction is always economic; that the payment of the ordinary fees of the accomplished architect is the most true economy." The Board of Directors in their report also congratulate architects not only because the probable increased demand for their professional services is near at hand, but also because the year now closing has brought with it many things to encourage the profession in the belief that it has obtained a firmer hold upon the confidence and respect of the national, state and municipal governments, and also of the people of the country. The intelligence will be received with satisfaction in this country, and it may have the effect of attracting some emigrants from the ranks of English architects.

A REPORT was presented to the convention on the subject of licensing architects. It appears that in five of the States Bills have been introduced in the Legislatures proposing tests for all those who were desirous to practise as architects. In Illinois alone a Bill has become law, and is now in operation, so far at least as organising the board of examiners. The general consensus of opinion as expressed by the replies of all the architectural chapters is in favour of some legislative enactment restricting the practice of architecture to those who have the ability to design strong and safe buildings. As regards the relation which the examination for license should bear to examination for membership in the American Institute of Architects, there is not such a strongly pronounced majority. The opinion generally prevails that the standard of professional skill and ability should be higher for fellowship in the Institute than is necessary for a State examination and the granting of a diploma, certificate or license. An analogous question, whether membership of the Institute should be more dependent upon professional skill and practice than at present, has received an almost unanimous answer in the affirmative. From the nature of the correspondence, the committee feel justified in recommending to the convention the adoption of a standard of examination that, while not inconsistent with the by-laws, would demand higher professional standards than have hitherto obtained.

VESTA as the goddess of fire and the domestic fireside was worshipped by Greeks and Romans. The latter also as part of her worship introduced the vestal virgins who were to keep the sacred fire alight. Any neglect of the duty was severely punished. She was generally represented as veiled, with a lamp in one hand, but according to Ovid there were statuettes of the goddess in which she appeared as covering her face with both hands. It is possible that the type was familiar to the Romans before they experienced Greek influence, and the old wooden statue in the Forum was probably of that class. It is remarkable that at the present time there is in a park at Savigny-sous-Beaune an old Roman altar on which appears the twelve gods, which seem to be reproductions of the statues in the Forum. Upon it VESTA is shown with her hands over her

face. So singular a gesture for a goddess was novel to the Romans, for the majority of figures represented the goddess as covered with a veil. At the last meeting of the Académie des Inscriptions M. SALOMON REINACH explained so peculiar an attitude by saying that it suggested the functions of VESTA and her endeavour to preserve her face and eyes from the effect of smoke. If he should be right, the French altar becomes of great importance in archaeology, for it is assumed to be the only example of the Roman VESTA which exists.

WE are glad to see that in Scotland there is what we hope is the beginning of opposition to the iniquitous system of picking architect's brains without paying for the operation. The work involved is not important, but the principle could be exemplified in a more trivial case. It appears that the trustees of Carnoustie *quoad sacra* parish church resolved to alter that building at a cost not exceeding 1,700*l.* The Trustees accordingly invited three or four architects to express their opinions as to the best way in which the work could be carried out. The architects, however, did not fall in with the arrangement, and nothing came of it. The Session then decided to ask competitive plans from architects in the neighbourhood and also from Edinburgh, Glasgow and Aberdeen, and in order that those who wished to compete might have an idea of what was wanted, they were invited to meet at the church when all necessary explanations would be given. Several of the Trustees attended at the hour fixed, but no architects responded to the invitation. Until there is a definite proposal with respect to finance, we hope the northern architects will hold aloof from the Trustees of Carnoustie.

AFTER several years' earnest efforts in sanitation the name of Dr. G. V. POORE is too closely associated with it to need any recommendation for his new book "The Dwelling House" (LONGMANS, GREEN & Co.). It is only a small book, and the advice may not be novel, but the authority of the writer gives importance to the contents. Dr. POORE advocates independent ventilation for all the channels of communication in a house, for he believes that in many large London houses they facilitate the exchange of foul air instead of serving for the supply of fresh air. For living rooms he considers a height of 10 feet is adequate, and 9 feet for bedrooms. The average hotel bedroom he believes to be unsurpassed for unwholesomeness and discomfort, while on board ship there is economy and comfort. "The besetting sin of modern hospital architects is," he says, "the giving of an extravagant excess of space in places where it is not needed," and Dr. POORE finds examples of a similar weakness in other buildings. A part of the book treats of the sanitation of the isolated dwelling, and therefore the sewage problem cannot be evaded. Dr. POORE has tried an experiment on a tolerably extensive scale at Andover, where he has a pleasure with luxurious herbage and flowers, apples, pears, peaches and nectarines manured with human ordure alone. There is much else in the book which is derived from the author's experiments, and "The Dwelling House" should be considered as one of the few modern books on sanitation which is not a compilation. Architects are not spared, but they can appreciate plain speaking in so important a cause.

(Continued from last week.)

Notes on some Westphalian Steeple Groups.

SEVERAL of the larger Westphalian churches have two, sometimes three, steeples; but they are not so elegantly contoured, nor do they group themselves with the grace which characterises Cologne, Andernach, Limburg, Worms, Gelnhausen and others of the Rhineland.

The Late Gothic façade of Münster Cathedral, which has, I am convinced, usurped the place of the old apsidal "western choir," is flanked by a pair of well-proportioned steeples of Transitional character—a rather misleading name by the way for that style in Germany, as it did not, like our Transition of Canterbury and the Temple Church, lead to the perfected Pointed of Salisbury and Worcester. These steeples of

a light *fleche* at the junction of the eastern pair of transepts with the nave and choir, which helps to carry off much of the building's square heaviness.

Besides the cathedral, two other of Münster's churches display a triplet of steeples. One is St. Lüdger's, where a tall Flamboyant octagon,* raised upon a Romanesque one of the same shape, lifts its graceful head from the centre of the church, while the western façade is flanked by a pair of modern Romanesque towers which, showing two depressed gables on each face, and crowned by low pyramidal cappings, are presumably modelled on the steeples occupying a similar position at St. Gereon's, Cologne. The other tower group is at St. Mauritius', a large church situated in a suburb some little distance to the east of the city boundaries—a suburb which, in grim ghastliness, may vie with some of our English ones, where paved walks, gas-lamps and policemen have not yet penetrated. Here we have three Romanesque steeples, one at the west end—a huge uncouth-looking mass, capped with a fantastic slate dome—and a pair of slim ones with quadrilateral spires of the

Southwell type, flanking the commencement of a lantern-like aisleless apsidal choir, which an architect of the Late Pointed epoch has grafted upon the nave. This last is a peculiar, and not wholly pleasing specimen of Romanesque, exhibiting, as it does, several very disagreeable localisms, as, for instance, an ugly roll-moulding to the arches of the clerestory windows, the aisle windows and the nave arcade, in which, at the head of the arch, a species of keystone is introduced. St. Mauritius' was sumptuously restored forty years ago, and its interior lavishly adorned with stained-glass and frescoes. In lieu of a triforium arcade there is a series of pictures *en fresco* in the naturalistic style, setting forth scenes from the Life of Christ and His Apostles. With one of these, representing the aged Evangelist, St. John, being led to his chair, I was especially struck. Below it was the legend, "Kindlein, lebet euch einander" ("Little children, love one another"), too obvious a one to need elucidation here. Another Westphalian church similarly "steepled," if I may use such an expression, is the Marien Kirche at Lipstadt. Fortunately this edifice, although in the heart of the town, is surrounded with fine trees—fortunately, I say, as it is one of the ugliest, clumsiest German churches of my acquaintance. Indeed, were it not for these embowerments, which serve to mitigate some of its uncouth outline, the structure would simply appear a gigantic deformity. It consists of a Transitional nave and aisles, covered by one enormous expanse of roofing, transepts of the same epoch, and an apsidal choir of the Flamboyant age. Like the western tower of St. Mauritius at Münster, this of the Marien Kirche at Lipstadt is of great bulk. Each side is divided into three compartments by vertical strips of plain masonry, the intervening rough portions being pierced with small Romanesque windows in two tiers, surmounted by that wavy species of corbel-table peculiar to German Romanesque work. A somewhat similar example of this type of tower is presented by

CHURCH OF ST. MARTIN AT HALBERSTADT, SHOWING THE WESTERN SCREEN FAÇADE BETWEEN THE STEEPLES.

Münster Cathedral are capped with low pyramids of metal, and immediately in their rear is that pair of western transepts which lend such invaluable aid not only in procuring elegance of external outline for a building which, without them, would appear heavy and clumsy in a degree, but in imparting an air of great spaciousness to the interior. Here they form a huge unbenched narthex, the utility of which is recognisable by those who have attended such crowded Sunday offices in this cathedral as the "Sing Amt" (People's Sung Mass) at midday, and equally popular "Zeigt" (Benediction) at five o'clock. Peeping over the roof of the south-western transept, which is lighted by a huge plate-traceried rose window on its south and east faces, these western towers of Münster Cathedral assist in composing a very pleasing group. In addition to them there is

the neighbouring church at Erwitte, another ponderous mass, but it has each of its sides gabled, and is thus relieved of some of its heaviness. The roofs of these four gables, meeting in a picturesque pseudo-Classical spire, this steeple of Erwitte would, I suppose, be called a cruciform saddleback. It certainly bears some similarity in its outline to those in the neighbourhood of Paderborn, though less prepossessing.

But to return to the Marien Kirche at Lipstadt, wherein the angle formed by each transept and the choir a slim tower of Romanesque work with a square spire is located. The clumsy Late Pointed choir, with its ponderous roofing—a

* An illustration of this elegant lantern tower appeared in *The Architect* of October 2, 1896.

choir of such hideous proportions that no one but a German could have conceived—well nigh stifles these towers. The fact is, this choir of the Marien Kirche at Lipstadt is one of that class to which allusion was made in the second series of our papers, viz. the "hall" class equipped with aisles and a procession path. The apse in this instance is a three-sided one, and each absurdly long side, as well as those of the choir, which it terminates, is pierced with a couple of tall windows of three lights apiece, and flamboyantly traceried. The ungainly mass of roofing that such an arrangement has entailed may be more easily imagined than described. A double-storeyed, and prettily fenestrated sacristy abuts on the north side, somewhat mitigating the general air of clumsiness which pervades the church, besides helping, with the angle tower and the transept, to compose a not unpleasing group.

Osnabrück Cathedral is another instance of a Westphalian trio of steeples. In this instance we have a severely simple western front, in which a lean, hungry-looking Flamboyant doorway and rose window have been rudely inserted, flanked on the north by an equally simple Romanesque tower devoid of buttresses or string-courses and rather slim in aspect, and on the other by a much broader tower, Romanesque in its lower stage, but decorated in its two upper ones. The first stage is quite devoid of doorway, or relief in the shape of arcading, of any kind; the latter are subdivided into two compartments by those strips of smooth masonry—in this instance horizontal as well as vertical—which form such a conspicuous feature in the Lipstadt, Erwitte and Münster examples; indeed, were it not for the presence of the small two-light Middle Pointed windows with which those portions of the tower comprised within these strips are pierced, the whole might, at a little distance, be mistaken for much earlier work. The Middle Pointed towers of St. Mary's, St. Catherine's, and St. John's churches here* group pleasingly with those of the cathedral, whose central steeple, I should have said, is an octagon gabled like Sinzig on each side, and capped with a stunted metal spire.

It is singular that not one of these Osnabrück towers is buttressed nor crowned by a stone spire; that feature to which Englishmen of the Nene Valley and the Holland of Lincolnshire can point with such pride being almost entirely absent from the architecture of Germany and the Low Countries. Instead of it, we have the fantastical leaden spire, the low, pyramidal slate capping, or the incongruous cupola; in no instance can the steeple be described as adequately terminated. In fact, German steeples are on the whole disappointingly monotonous.

I must confess that I decidedly liked Osnabrück, about whose cheerful streets on a bright summer's morning, after a night of steady rain, it was very pleasant to find oneself wandering. St. John's was particularly delightful. Here the lover of picturesque entourage, and such Mediæval furniture as richly carved choir stalls, tryptichal reredoses and *Sakraments Häuslein* will have his tastes gratified. Nor will the admirer of that solemn mingling of Romanesque and Pointed work peculiar to Teutoland think an hour amid the aisles of Osnabrück's Cathedral misspent—aisles which have of late emerged gorgeous from the palette of the fresco-painter, who, to judge from the portentous scaffolding now concealing the square-ended choir, is extending his operations to that most sacred portion of the building. Personally, I prefer to see the church in its simple, unadorned state, particularly as the polychromatic decoration now disclosed to view in the nave aisles lacks that delicacy and refinement which, it is pleasing to observe, is the leading characteristic of such work undertaken in our own churches. As an example, I may draw the attention of my readers to the work of Mr. Daniel Bell in Butterfield's church of St. Matthias, Stoke Newington. Without interfering with the characteristic features of that noblest of London church interiors, the work, as far as it has gone, has mitigated some of that dignified severity† which those who know St. Matthias will recollect constitutes its most striking feature. The church steeples passed on the line of railway between Osnabrück and Hildesheim do not present any very strikingly-marked localisms. The general type, however, seemed to be that in which a short spire of lead or slate, tapering at its summit, spreads itself out at the base to meet a broad tower, somewhat after the fashion of such Surrey and Sussex examples as Tangmere, Pevensey, Merstham and Shiere. Steeples of this kind surmount Hildesheim's two noble basilicas of St. Godehard and St. Michael, structures whose internal beauty resides chiefly in the arcades of their naves, where the rich carving of the pier-caps and the elevation generally recalls

the rich Byzantine Romanesque of the south. The illustration given of St. Godehard's in the first series of these papers renders any further description of that church unnecessary. I have therefore borrowed a slight notice of St. Michael's from the pages of Fergusson's "Ancient and Mediæval Architecture"—one of those fascinating volumes which, like Petit's "Architectural Studies in France," and the same writer's "Illustrations of Church Architecture," can only be laid aside with reluctance when once in hand.

"The church of St. Michael at Hildesheim," observes the critic above alluded to, "is among the earliest and most interesting of those remaining in sufficient purity to enable us to judge correctly of their original appearance. The plan consists of nave and aisles, an eastern and western transept both projecting beyond the aisles and flanked by octagonal towers with staircases in them. The west choir of one bay and apse is flanked by two vestries with a low aisle round the apse and entered only from it. At the east end there were originally a central and two side apses, but in the twelfth century the central apse was replaced by one of equal length to that at the west end. The entrances are, as usual, on each side of the nave and none at the west end. Though the proportions appear short with reference to the breadth, considerable additional effect is given by the screens which shut off both arms of the eastern transept, so as not to allow the perspective effect to be broken. Hence the continuous view of the central aisle, being six times as long as it is broad, gives the appearance of far greater length to the church than could be supposed possible from its lineal dimensions."

The Rectangular Screen Façades of Goslar and its Neighbourhood.

Although I had seen those unaccountable doorless, turret-flanked and rectangular screen-like western façades in such churches of the Low Countries as Notre Dame at Maastricht and its locality, as well as in the great abbey of Corvey about a mile from Höxter on the eastern confines of Westphalia, I was none the less interested in the examples which sundry towns in the Harz district, notably Goslar, Gernrode and Halberstadt, presented to the notice. St. Blasius at Brunswick,* a long, low, cruciform, triapsal Romanesque structure, has such a façade, flanked by turrets, pierced with a Middle Pointed window and rising high above the nave roof. Several other churches in the same city, notably St. Catherine and St. Martin, are dignified by this same anomalous feature, which does not seem to have been confined to the Romanesque style alone, but to have become popular through all the epochs of Pointed. Strasburg Cathedral offers a splendid example of this treatment, and the Dom at Meissen a humbler but very elegant one. But perhaps the finest and most imposing early examples of this peculiar type of western façade, to which such great rectangular belfries as one sees in the neighbourhood of Toulouse, at Montgiscard and Ville Franche bear a curious affinity, are those attached to the Neuwerks and Jacobi Kirchen at Goslar, which, from their contiguity to the railway station, I was enabled to inspect with tolerable leisure. Paucity of time and the unfavourable weather precluded me from prosecuting my ecclesiological studies any further in this most fascinating old town—the remains of its cathedral and the curious double-storeyed chapel of St. Ulrich, attached to the Kaiserhaus, remaining perforce unvisited.

The Neuwerks Kirche, now in the hands of the Protestants, is a very splendid specimen of the Romanesque prevalent in this district of Germany, its apse, with the arches spanning its windows, being carried on twisted shafts detached from the wall, almost rivalling the celebrated eastern terminations of the Rhine churches in richness. Unlike Gernrode, Hecklingen, Wechselburg, and other churches of the Harz, this one at Goslar is vaulted throughout, but it has several provincial localisms, such as the nave arcades, of which there are two to each vaulting bay, carried on square piers with a slender shaft niched in each angle, canted off, as at Hecklingen and Wechselburg, to receive it. One of the vaulting shafts was twisted in the most curious serpentine fashion. The church being, as I have said, in Protestant hands, has a cold, lifeless appearance, but the walls and conch of the apse have been most gorgeously frescoed, the latter, I was surprised to see, with a representation of the Coronation of the Virgin. Presumably all these are restorations. The western screen façade of this church, with its flanking octagonal turrets, is very imposing.

(To be continued.)

The Next Ordinary Meeting of the Society of Engineers will be held at the Royal United Service Institution, Whitehall, on Monday, November 1, when a paper will be read, entitled "Sea Defences," by Mr. Richard F. Grantham.

* Erroneously styled a cathedral in some handbooks to North Germany, a distinction to which it never at any time could lay claim.

* All these churches are typical Westphalian ones of the Decorated period. St. Mary's, it will be remembered, was alluded to in our list of churches having a clerestoried choir whose apse is provided with a processional aisle and radiating chapels—a rarity in this part of Europe.

† In this church there is a large wall space left above each arch of the tower which forms the chancel on the ground plan. The Crucifixion has been portrayed above the western, and the Adoration of the Elders above the eastern arch, with fine effect.

THE PURCHASE OF "MERLIN AND NIMUE."

THE following evidence was given by Sir John Gorst before the select committee on Museums of the Science and Art Department:—

The Chairman: You are Vice-president of the Committee of Council on Education?—Yes, and I attend by the direction of the Lord President of the Council to give the committee an account of the circumstances under which the Burne-Jones water-colour, *Merlin and Nimue*, was purchased.

You will be good enough to make a statement?—I will make a statement about it. This picture was part of a collection of the late Mr. Liebhart, of Newcastle; it had been seen by the officers of the Science and Art Department and by Lord Carlisle, who is one of the referees, as long ago as 1884, and in April of last year it came into the market. The Museum had long been anxious to obtain a specimen of Burne-Jones's water-colours for the historical water-colour collection, and Mr. Armstrong, the art director, recommended that the opportunity should be taken of acquiring this particular picture. The purchase was officially recommended by Mr. Armstrong in a memorandum of April 6, 1896. The amount of the note out of which the purchase had to be made was 700*l*. The price asked for the picture was 800*l*., and it was therefore necessary to transfer 100*l*. from one of the other sub-heads in order to have a sufficient amount to make the purchase. Dr. Middleton was consulted upon this transfer, as it was practically transferring money from the sub-heads over which he had control to a sub-head immediately under the art director. It was no part of Dr. Middleton's official duty to approve of the purchase, but he did so far approve of the purchase that he recommended and acquiesced in the transfer of 100*l*. from the Museum vote to this vote.

This was a transaction which took place before Dr. Middleton's death, when the purchase was being considered?—Yes, when the purchase was being considered. There was also brought to my notice in the matter a letter dated April 28, 1896, from Mr. Edward Clifford. This is the letter. It was addressed, I think, to Mr. Armstrong. "Dear Sir,—I have heard that there is a possibility of your buying for the nation Burne-Jones's water-colour of *Merlin and Nimue*, belonging to the late Mr. Liebhart. I should much like to know if this is true, for I had been rather thinking of buying it jointly with some friends of mine; but I would far rather that it belonged to the nation, and should be delighted to hear that it is true. I have for many years considered it the most beautiful and the most characteristic of all Burne-Jones's water-colours, and almost the finest piece of colour in the world. I know nearly all his work, and possess a good many of his water-colours, one of which I may probably leave to the nation. If you would send me a few lines respecting the matter I should be much obliged, as if the nation should not buy it I should like to be moving in the matter.—Sincerely yours, Edward Clifford." There was also a letter from Lord Carlisle, dated May 6, 1896. "Dear Armstrong,—I understand that the pictures of the late Mr. Liebhart, of Gateshead, are shortly to be sold. I had always hoped that the Museum might be able to acquire the picture of *The Merciful Knight*, by Burne-Jones, which seems to me to be the finest work of that painter. But as I am told that 200*l*. is being asked for that picture, I fear that with the reduced grant this purchase may be impossible. In that case I hope that you may be able to get another picture by Burne-Jones of *Merlin*. This picture is perhaps the finest specimen of Burne-Jones's earlier manner, which is so entirely distinct from the work that he does at present that the acquisition of a picture of this date, about fifty years old, is really equivalent to the purchase of a work of a deceased master. As the Government has considered that Sir Edward Burne-Jones's reputation was worthy of especial honour, I think that the acquisition of a picture of his for a public gallery can only be considered natural and suitable. I am certain that admirers of Burne-Jones's work would consider that the *Merlin* was a proper example of his earlier style." Well, this matter being brought officially before me by Mr. Armstrong, and supported by these two letters which I have read, I thought that as the transaction was a little out of the common, because special arrangements had to be made in order to provide the money necessary for its purpose, I thought it ought to be referred specially to the Lord President; and I accordingly referred it especially to the Lord President, with the observation that he might perhaps have opportunities of obtaining an outside judgment on the value of the picture and the expediency of purchasing it which I did not possess. The matter then passed into the Lord President's hands; that was on May 11 that I referred the matter to him, and on May 22 he officially stated that, having made such inquiries as he had been able, he thought that the purchase ought to be approved, and it was accordingly approved, and the picture was bought for the sum of 800*l*.. I am able to state to the committee, by permission of the Lord President, the particular views which he held upon the matter, and also the person whom

he consulted. He thought that sooner or later it would be necessary for the Museum to acquire a picture by Burne-Jones to make the historical collection of water-colours complete; that the works of this particular artist were not very numerous; that they were mostly in private collections or in permanent galleries; that he was not a very young man, and therefore the prospect of acquiring one of his pictures was one that ought not to be lost. The Lord President, knowing that the particular merit of this particular artist was a subject of very heated controversy in the artistic world, thought it desirable to obtain the advice, not of persons of whom it could be predicted beforehand that they would take one side or the other in the artistic controversy, but to get some entirely independent authority on whom he could rely; and he consulted Mr. Varley, believing that Mr. Varley would carefully consider the expert advice that was open to him, and believing that the expert advice of Mr. Varley was as good as could be obtained. Mr. Varley took some time to consider the matter. He gave it as his opinion, after consideration, that it was desirable to acquire a picture of this kind for the national collection; that the price asked for the picture was as low a price as you could expect to obtain it for; that the picture, in fact, could not be bought for less than the 800*l*. which was asked, and that there was not any reasonable prospect of obtaining an example of Sir Edward Burne-Jones's work at a less price. Having received this advice from Mr. Varley, the Lord President thought it his duty to sanction the purchase, and the purchase was accordingly sanctioned.

Sir Henry Howorth: The only question I should like to ask is this. I understand that a portion of the purchase money in this case was obtained from the ordinary Museum vote by the sanction of Dr. Middleton, and was transferred to the fund for the purchase of water-colours; is that so?—Yes; not exactly by the sanction of Dr. Middleton, because it could have been done without his sanction. The President or the Vice-president of the Council has the power, under the Treasury regulations, of transferring from this sub-head F; he can transfer at his pleasure from one item of sub-head F to another, so long as the whole item, however, is not exceeded; and therefore the thing could have been done even if Dr. Middleton had objected, but it was thought courteous to discuss it with Dr. Middleton, and to obtain his assent to the proposed transfer before it was actually made.

Then the two votes are not actually substantive votes, but you can make drafts from the one for the assistance of the other?—There is a vote F, and F has several sub-heads; and it is from one sub-head of F to another that you can make transfers.

Can the Vice-president at any moment transfer the whole vote?—Yes; the sub-head F is treated as a whole, and although, for the information of Parliament, it is divided into a number of sub-heads—F 1, F 2, F 3, and so on—yet the Treasury allow the Department to treat this vote as a whole, and as long as they do not exceed the whole vote they may spend it on whichever item they like. I find that now the vote is actually taken as one, and there is no division; but in the year when this purchase was made it was, as I have explained, F 1, science collections, including science library; F 2, art collections; F 3, reproductions of works of art; F 4, hire of specimens, &c.; F 5, photographs of particular art objects, preparation and circulation of chromo-lithographs and etchings; F 6 (this was the particular head), historical collection of oil and water-colour paintings; F 7, exchange of works for specimens of corresponding value received from abroad; F 8, art library books, printing, drawings, &c., and deposit loan of books to schools of art; F 9, preparation, illustration and painting of catalogues, inventories, handbooks and guides, &c.; F 10, carriage, materials for packing, mounting and repairs. The amount of the whole of the F vote was 14,360*l*., and of this particular item F 6 was 700*l*.. In the present estimates it is put into four divisions, F 1, F 2, F 3 and F 4; and F 2 is art collections, including art library, &c., grant in aid of purchases, 11,260*l*.

The point I was rather driving at was this: that that vote is a vote nine-tenths of which is really for the South Kensington Museum proper as an art teaching institution, and the other tenth is an entirely distinct vote for the purpose of creating an historical collection of water-colour paintings?—No, the historical collection of water-colour paintings is now amalgamated in the bulk of the vote; it is not separated, the only things separated are the science collections, the preparation of catalogues and the carriage and materials for packing.

How long has that been the case, because I understood that the vote for the pictures was kept an entirely different matter from the vote for the South Kensington Museum?—I do not think the vote was kept as a distinct matter; but the officer who had the responsibility for the recommendation of pictures for purchase was a different officer from the one who recommended the purchases made out of the other part of the vote.

Would it be possible, if the Vice-president thought right and good, virtually to absorb the whole of the vote granted by

Parliament for the purpose of this Museum, in addition to the water-colour collection?—It would be possible now under the present form of the vote, certainly. I suppose it would be possible. I do not know that it would be reasonable or consistent with the duty of any official, but as a matter of actual financial possibility the whole 11,260*l.* which is going to be voted this year could all be spent on one picture.

And if, as a matter of fact, under the present conditions of the vote being very greatly reduced for the Museum you should have a very desirable, a most desirable water-colour picture offered for purchase, it would be possible in the purchase of such a picture to further starve and dwarf the resources of the Museum proper?—Yes, quite possible, if you had a very foolish man for Vice-president; I mean he could do it, but I do not think it would be possible as long as any reasonable and rational person was at the head of the business.

Lord Balcarras: Would you please tell us from whom the picture was bought?—It was bought from Messieurs Boussod, Valadon & Co., of the Goupil Gallery.

From a dealer?—I do not know what he is. I have no doubt he is, but it is the Goupil Gallery, 5 Regent Street. I have no doubt it is a dealer, but I do not know it of my own knowledge.

Can you tell the committee how the price was determined?—It was offered at 800*l.*

How was the value determined?—It was determined, I suppose, ultimately by the advice of Mr. Varley. That was the price that was named; it was offered for that sum, and the question was whether it should be bought for that sum. It was not a question of putting a value at large on a picture. An offer was made, I believe, of 700*l.*, but it was refused.

The dealer refused 700*l.* for it?—I believe so.

Was not other outside expert advice taken besides that of Mr. Varley?—No, I think not.

You said, I think, in part of your evidence that it was no part of Dr. Middleton's province to be consulted on the purchase of pictures?—That is so; the purchase of pictures was not in his department. I think that has been explained several times in the evidence.

You told us that 100*l.* was transferred from some other sub-head to sub-head F 6; will you tell the committee from what sub-head it came?—It was not transferred from any other item, but it was spent out of the general savings of the sub-head; the savings out of other items of the sub-head.

I do not understand.—Sub-head F consists, as I explained to the committee just now, of ten different sub-heads, and on some of those there were savings, and it was out of these savings that the picture was bought.

This picture was bought in the month of May, was it not?—Yes.

Quite at the beginning of the financial year; how can you say that the sum was taken from savings?—Because you can very early in the financial year estimate that there will be savings; that is nearly six months after the estimates are really made. The estimates are made about November or December practically, and in May you can see that you are going to make savings.

This purchase was not foreseen; is it not quite possible that corresponding purchases for the art library, or ceramics, or the Museum generally, which are not foreseen, might arise?—It is quite possible. What I mean is, there was no actual transfer from any other sub-head to this particular sub-head to provide the funds; the sub-head F 6 was overspent to the extent of 100*l.*, and the Department ventured to overspend to the extent of 100*l.* because they saw that on other sub-heads there would be savings.

The point I wish to raise is, How did the Department know that there would be savings after three months or two months of the year had gone by?—It is two months of the year, but a very long time since the estimates are made. The estimates for the year are made, as I said, about December, and May is five months after. Although the estimates are produced to Parliament in February or March, they are actually made in the Department itself in December, and five months after the time when the estimate is made you are able from your expenditure to see, or to estimate, that you will be able to make savings.

That is to say, the expert officials of the Department are able to anticipate a couple of months after the beginning of the financial year that no objects of a great and important character may be brought to them unexpectedly?—No, they are able to estimate two months after the beginning of the financial year that upon the total vote of about 14,000*l.* there would be 100*l.* of saving.

Was the President of the Royal Academy consulted; I understood from question 110 that when there is an important purchase of pictures he is almost always consulted?—He was not consulted on this occasion.

And the director of the Art Museum was not consulted either as to the desirability of the purchase?—Do you mean Dr. Middleton?

Yes.—I understand he was.

I understood he was not.—Not officially; he would not be officially consulted, but I understand Dr. Middleton approved of the purchase. It was no part of his official duty to give advice.

And it was considered by the Department that there was no chance of getting a water-colour by Burne-Jones of importance under 800*l.*?—Yes, suitable to the historical collection.

Can you tell us when this picture was painted?—It says in the advice that it was painted fifty years ago; that is all I can tell you.

I think Sir Edward is in his sixty-third year, is he not?—Well, then, I suppose he would hardly paint it at thirteen. I am afraid I cannot tell you the exact details about the private history of artists. It certainly says it was painted about fifty years ago.

Does it say "about," or fifty years ago?—I read it to you; I think it is Lord Carlisle who said, "The acquisition of a picture of this date about fifty years old." I must say that the writing is so bad that it might be either fifty or thirty. I probably have misread Lord Carlisle's letter; it is probably meant for thirty there.

It was merely because I was surprised—no doubt owing to the mistake that the expert consulted should have said the picture was fifty years old, whereas it is about thirty-six years old?—That is not an expert; it is Lord Carlisle.

Is he not one of the expert advisers of the Department?—He is not one of the expert advisers, but he is one of the referees.

You said something just now about a picture being suitable; if it was suitable you could make those transfers from one vote to another. The suitability of such a picture, I suppose, depends upon its being representative of the artist, does it not?—I think so.

Can you tell the committee how many other water-colour paintings you have got by Sir Edward Burne-Jones?—I do not think we have got one; I think this is the only one. I understand we have no others.

And you consider this representative of the master?—I do not presume to consider it myself; I am told by experts that it is. I would not venture to express an opinion of my own on the subject.

We understood that you chose to give evidence upon this particular point because the Parliamentary, rather than the artistic, advisers of the Department were responsible?—Certainly.

Is there anything in the evidence you have given to the committee which would be at variance with the evidence which you would have given as to the purchase of any picture for the Department during the last fifteen years?—Well, only that in this particular case special care seems to have been taken, very special care in the purchase. It seems to have been a purchase made after a good deal of deliberation and consideration. If you are purchasing a small thing from Christie's, or something of that kind, you do not perhaps have so much discussion about it and so many people asked.

What I really want to know is this: I want to know what differentiated this to such an extent that the Parliamentary heads of the Department should think it necessary to give evidence?—I understood the propriety of this purchase was questioned.

This was bought on the ordinary system of purchase and is in no way different from the general practice pursued in buying for the historical collection?—This is a very fair example of the mode in which purchases are made.

Did the money, the 800*l.* spent upon this picture, preclude your being able to buy any other picture during the year?—I think so; I do not think any other picture was bought.

Dr. Farquharson: Do you consider it an advantage when a special object turns up that you want to buy, to be able to deflect funds from some other source?—Certainly; and it is in consequence of that advantage that the Treasury has now altered the form of the vote, so that there is no question about it; it is a vote in aid for the purchase of these objects, and we can apply it as we like.

And you found on this occasion the practical advantage of being able to transfer it?—Yes.

Have you given evidence about this picture because it is a typical instance of the methods by which purchases are made?—Yes; I consider it a typical instance.

Has there been any controversy outside as to the merits of this particular picture?—I suppose there must have been; I suppose there must have been a great deal of controversy.

I am rather in ignorance of why this particular picture has been picked out for special examination before this committee. You are not prepared to give any individual opinion as to the merits of this picture?—No.

You use the words "National" Collection of Water-Colours; that means, I suppose, that you wish to have at least one example of every prominent British water-colour painter?—Yes, I think so; there is an historical series of water-colours

which contains examples of every celebrated British water-colour artist.

And I think I also understood you to say that at that time there was no specimen of Burne-Jones?—None.

Do you consider, from your knowledge of the position Burne-Jones holds in the art world, that 800*l.* was an excessive price for the water-colour?—That is a question I could not answer.

What was the size of it?—I do not know that.

I suppose you do not wish to give an opinion as to whether Burne-Jones has a separate reputation as an oil-painter?—No, I should get myself into very hot water if I were to express my opinion on such a subject.

At all events, in the opinion of Mr. Varley—who, I suppose, is a man of knowledge—this was a representative work of the master?—It was.

And therefore it was considered worth the money paid for it?—Yes.

Mr. Bartley: I suppose there is a great difference of opinion as to all these works of art, is there not?—I suppose so, I believe so.

Do I understand that in this particular purchase there was, first of all, the recommendation of the art director, and also the director of the Museum?—No; there was no official recommendation by the director of the Museum.

No; but still he was aware of the fact, and made no objection?—Yes.

Sir, Henry Howorth: But he was not responsible?—No; he was not responsible. There was no official recommendation by Dr. Middleton, but there was this statement by Mr. Armstrong:—"I have consulted Dr. Middleton, who agrees to the transfer of 100*l.*, if necessary, from the Museum Purchase Vote, and he knows the drawing and values it as highly as I do."

Mr. Bartley: You had this recommendation from these two authorities in the Museum; but when it came before you as Vice-president you thought it sufficiently important to go before the Lord President?—I did; chiefly because of the manipulation of the vote, I mean the way the money was taken. It exceeded the vote, and I did not think I was authorised in exceeding the vote without the Lord President's sanction.

And the Lord President, in order to get the best opinion he can, calls in Mr. Varley; is that so?—Yes.

And therefore all this was taken in order to be quite sure that the purchase was a wise one?—Yes.

Because you and the Lord President, I suppose, do not make any opinion yourselves, you entirely rely on expert opinion from outside?—Entirely.

And everything was done in this particular purchase to secure the best advice that could be obtained?—Yes.

Whether you agreed with it or not, as an individual?—That is so.

And you consider that is the right way in which such a purchase as this should be made?—Yes, I think so.

Could you suggest any plan by which greater care could be taken to secure proper purchases?—No; what I think the Lord President or the Vice-president are responsible for is securing really good expert advice. I think if they were to make an important purchase of a picture of an artist about whom there was any controversy without that sort of advice they might be very much to blame.

If they can cover themselves by the best expert advice, you think that is all they should do?—Yes.

And that was done in this case?—Yes.

THE ARCHÆOLOGY OF NORWICH.

A JOINT meeting of the Norwich and Great Yarmouth branches of the local Archæological Society was held last week in the city, and considering that the objects of antiquarian interest included in the day's sight-seeing must already have been familiar to very many of the party, the attendance, says the *Norwich Mercury*, must be regarded as very satisfactory. The perambulation was made under the guidance of the genial secretary, Mr. L. G. Bolingbroke. A start was made at eleven o'clock from Thorpe Station yard, and the party proceeded down the riverside in the direction of the Devil's Tower. Here and there along the way a halt was made while objects of interest on the further side of the river were pointed out and commented upon by Mr. Bolingbroke from notes sent him by the Rev. W. Hudson. Messrs. Ransom's timber yard was stated by Mr. Hudson to be on the site of the old pleasure gardens, known as the Spring Gardens. The riverside of those days must have been truly a pleasant resort if, as it appears was the case, its river bank for nearly the whole of the stretch from the present bridge to the city walls was lined with leafy trees and flowering gardens, with glimpses in the distance of fine old mansions fronting what now is King Street. In this respect, times have changed for the worse indeed. In the wall of a timber build-

ing, of decidedly utilitarian aspect, now bearing on it the name of Mr. George Base, oil merchant, the outline of an old water-gate was pointed out, constructed, it was stated, by the Austin Friars. Through this, it was thought, one of the "cockies" of the city discharged its waters. Near by once stood the chapel known as St. Ann's Chapel; St. Ann's Lane and St. Ann's Wharf in the vicinity still testify, in name, to its existence. Mr. Hotblack observed that a famous and original picture of the water-gate, by Crome, was included in the Norwich Society's collection of pictures in the Museum. Arrived at the Devil's Tower, a further halt was made while Mr. Bolingbroke read notes as to the raising of the city walls in general, and of the four towers which, at this spot, stand within a stone's throw of each other. This particular tower, whose remains are yet a pretty solid piece of flint masonry, was, the party learnt, the gift to the city of one Richard Spinks, who also furnished a massive chain-boom to keep out intruders by the water, and the necessary apparatus, affixed to the western tower, to draw it up when needful. Crossing Carrow Bridge, the ancient Conisford, rich with its memories of bygone days, was entered. The site of the old gateway was observed, and further on the ruins of the church of St. Peter Southgate, which was demolished in 1882. On the site of the Albion Mills, opposite, stood a chapel, called St. Olave's Chapel, which was demolished somewhere about 1345, and the parish united to St. Peter's Southgate. Close by, the Hildebrand Hospital exercised its charitable functions as a habitation for certain poor parishioners. A stone in the wall still recalls the name by which it was sometimes called, Ivy Hall. At the Dissolution, the site of the hospital was granted to the Mayor and Commonalty of the city. At the present time a number of quaint tumble-down cottages, built evidently out of the ruined structure of the hospital, occupy the site. Continuing the tour citywards, Dr. Bensly, at a halt close by St. Julian's Church, called attention, by an interesting paper, to two historical houses, Sir Robert de Salle's house, at the bottom of what is now Mariner's Lane, and, a little further on, the famous Music House, or Jew's House. Sir Robert observes Froissart, in his *Chronicles*, in a passage narrating his death at the hands of a mob, was "the handsomest and strongest man in England," and the lamentation at his death was widespread. At the Music House, once the residence of the wealthy and much-persecuted Isaac of Norwich, the visitors examined with interest the crypt, now about on a level with the street outside, and used for the storage of casks, and the lofty dining-hall above it. The latter has been divided into two apartments by a flooring, once substantial enough, but now decidedly shaky. The timber-work of the roof is still in excellent condition. Papers were also contributed dealing with the histories of St. Etheldred (St. Audrey) Church and St. Peter Permounter-gate Church. At the former some of the fine old communion plate was on view.

After a brief interval for luncheon, the tour was resumed with a visit to St. Andrew's Hall, Blackfriars' Hall and the Middle School, where Mr. Jas. Mottram discoursed upon the objects of interest. Recent excavations in front of the Guildhall having brought to light an interesting archæological find, the members listened with some interest to a communication on the subject from Mr. Arthur Collins, the city engineer:—"Whilst making excavations for the purpose of laying electric light cables an extensive settlement was discovered at the east end of the Guildhall. On opening out the ground for the purpose of seeing the cause of this settlement, an arched opening was discovered in a flint wall standing immediately in front of the Guildhall wall proper. The top of the arched opening in question is about 8 feet under the level of the roadway. The wall through which it is pierced is about 2 feet 6 inches thick. Within this arched opening there is a cavity in the wall of the Guildhall proper, this cavity having a length from north to south of about 4 feet 6 inches and a width from east to west of about 1 foot 6 inches. The bottom of the arched opening and cavity is 3 feet 6 inches below the level of floor of crypt. On examining the east wall of crypt beneath Guildhall from within the lines of two quoins are distinctly visible. The survey which has been made does not show these quoins to correspond with the ends of cavity in wall. It may be noted that the ends of cavity in wall are rough and irregular. The cavity is not arched over, but the wall of Guildhall proper appears to have been corbelled over approximately flat to cover it. The arch over opening is built in flints and bricks. Originally it was bricked about 4½ inches thick, but all but one of these bricks have disappeared, leaving the rough flint arch above. The excavations also disclosed a disused well having an internal diameter of about 6 feet, which was sunk to a depth of 50 feet from the surface of the road. There was no water in the well, and a lamp which was lowered to the bottom showed that portions of the sides had fallen to the bottom so that the original depth could not be ascertained. This well is arched in brick, the springing level of the arch being 6 feet below the surface of the road. The well is bricked to a depth of 16 feet

beneath the surface of the road, below which the chalk through which the well is sunk is not supported. The natural level of the chalk appears to be about 6 feet below the surface of the road." A visit to St. Andrew's Church, where Mr. F. R. Beecheno read an interesting paper, describing the brasses and monuments in the church, ended the day's journeyings.

In the evening Dr. Bensly presided at a dinner given by the Society in honour of the Yarmouth members at the Maid's Head Hotel. An opportune paper was contributed by Mr. Hudson, based upon extracts from the registers of St. Peter Permouthergate parish. They are entertaining specimens of the local echoes of national feeling:—"October 19, 1798, form of prayer on the victory obtained by Admiral Sir Horatio Nelson over the French Fleet off the Nile, August 1, 6d.;" "November 12, form of prayer for general thanksgiving on November 29, 1s.;" "November 29, paid the ringers, thanksgiving day, evening illuminated, 10s. 6d." The peace of Amiens was welcomed with a delight which shows how heavily the burden of a prolonged war had been weighing on the people. Even in October 1801, the ringers were paid "for two days on account of signing preliminaries of peace 17. 1s." On March 31, 1802, they were paid 10s. 6d. "for peace being proclaimed," and a copy of the proclamation, a form of prayer, and a notice cost 1s. 6d. The war, however, broke out again. In 1804 England was trembling with the fears of invasion, and all the hopes of the nation seemed to rest on the fleet, and especially the popular hero, Nelson. On May 25, 1804, a "form of prayer and proclamation for a general fast" were paid for, and the same again on February 20, 1805. Then later in the same year the relief came. We read:—"December 5: Paid for a form of prayer and proclamation on account of the late glorious victory obtained over the combined fleets of France and Spain, by Lord Viscount Nelson, off Cape Trafalgar, on October 21, 1s." No bells were rung in the great admiral's own county, for the glory of the victory was overshadowed by his death; and then we read:—"1806, January 9: Paid Church (the sexton) for tolling the bell two hours, being the day of Lord Viscount Nelson's funeral, 4s." Still the war went on, but no notice is taken of the Peninsular victories. When, however, in 1814 Buonaparte was driven to abdicate, the churchwardens of St. Peter Permouthergate seem to have quite lost their heads. They enter, April 12, 1814, "Putting flag upon the steeple on Buonaparte's overthrow, beer, ditto, 7s. 6d." There is a delightful vagueness about the comparative cost of the flag and the beer. Then again, "Ringers and beer, illumination day, 7s." If we may suggest that in the former entry the flag cost 6d. and the beer 7s., then it would seem that on this occasion, under the influence of 7s. worth of beer, the ringers forgot to ask for their usual 10s. 6d. Everybody was evidently very happy at "Buonaparte's overthrow," for that same year was paid "Parr & Co., cloth for sexton's coat, 3l. 4s., and making sexton's coat, gold lace, &c., 3l. 14s. 6d." They meant to keep up their dignity when they had overthrown Buonaparte. But alas! for their satisfaction, Buonaparte was only half overthrown; he escaped from Elba, and was soon again a terror to Europe. Now churchwardens were only human, and victories and beer were all very well now and then, but you might have too much of them. A "general fast" only cost 6d., but here was a fearful prospect of endless repetitions of "ringers and beer." So they apparently determined to have no more to do with such things. If England expected every man to do his duty their duty was to see after the parish, and they couldn't be upset with these disturbing elements. So even when they were officially enjoined to be thankful for the crowning victory of Waterloo they only grumpily put down "Prayer and letter for Waterloo business, (!) 2s."

THE PREHISTORIC LAKE VILLAGE AT GLASTONBURY.

A CORRESPONDENT of the *Times* says that the site of the prehistoric Celtic lake village, near Glastonbury, has been further excavated since July last under the superintendence of the discoverer, Mr. Arthur Bulleid. The sites of the dwellings are marked by mounds. One of these contained the greatest depth of clay yet found, no less than 9 feet; the accumulation of successive hearths which were found necessary as the weight of the clay gradually compressed the peat beneath. This mound contained 600 tons of clay, all of which must have been brought in their boats by the inhabitants from the neighbouring hills. Under the mound was found the framework of a loom with brushwood and wattlework to form the foundation. That the inhabitants were much engaged in spinning is clear from the fact that, in addition to other things connected with the craft, no fewer than forty horn and bone carding combs have been unearthed. Strangely enough, no two of these are exactly of the same pattern. As in previous seasons a large number of bone articles have been discovered. The number of broken bone needles and splinters of bone found in one mound seem to indicate that

it was utilised as a needle factory. Another mound was very rich in fragments of pottery and other evidences of the manufacture of hardware. No fewer than ten bronze *fibulae* were found, these being fashioned almost exactly like the modern safety pin. Two bronze studs, probably a part of harness or for fastening clothing, were also found, together with other small bronze articles. A neatly cut iron file about 8 inches long was found. As usual, very few human remains were discovered, part of the skeleton of a very young child being all that was brought to light this summer. With the exception of the cracked skulls of a few unfortunate warriors, the remains of very young children have chiefly been found in past years, Mr. Bulleid being of the opinion that these primitive people conveyed their dead to the neighbouring hills for interment. Parts of three broken millstones were unearthed, and in one mound a clay oven, measuring 2 feet by 9 inches. One glass article only was brought to light this year, a blue glass bead with a wavy line of dark blue running round it. Altogether the season's work has proved very interesting, and the British Association is so well satisfied with the discoveries made from time to time that at their Toronto meetings they renewed their grant towards the excavation fund.

SCULPTURE OF GLASGOW ART GALLERIES.

THE following report has been presented to the New Art Gallery committee by Mr. George Frampton, A.R.A., master sculptor, and Messrs. Simpson and Milner Allan, joint architects:—

We beg to submit, for the approval and consideration of the committee, the following outline of the scheme proposed for the sculpture and carved work of the structure:—

1. North porch.—The important group of three figures under the central arch of entrance will represent "St. Mungo as the Patron of Art and Music," the keystone of the great arch bearing the arms of the city of Glasgow. The spandrels of this arch and its two fellow arches to the east and west will be filled with groups of figures in low relief representing instrumental and vocal music. The three pedimental compositions on the east, north and west faces of the first upper stage will be formed of cartouches supported by amorini, and containing heads in full relief representing the great trio of Greek art—Ictinus, the "Architect;" Phidias, the "Sculptor;" and Apelles, the "Painter." The dome of the porch will be crowned by a winged bronze figure of "Victory," with attributes of "Success," palms and wreaths.

2. The tympana of the thirty arches over the windows of ground floor will each contain decorative carving, of which the centre piece will be a cartouche and scroll bearing the names of the great artists of the Renaissance period, surmounted by the arms of their native city or country, *e.g.*:—England—Joshua Reynolds, Christopher Wren, Inigo Jones, &c. Scotland—Robert Adam, James Gibbs, &c. Germany—Albrecht Dürer, &c. France—Claude Lorraine, Antonio Watteau, Perrault, Jean Goujon, &c. Holland and Belgium—Rembrandt, Holbein, Rubens, Vandyke, &c. Italy—Raphael d'Urbino, Vignola, Palladio, Michel Angelo, Donatella, Benvenuto Cellini, Bramante, Sansovino, &c. Spain—Velasquez, Murillo, &c.

3. The thirty-six piers dividing these windows are terminated by festooned cartouches. These will each bear a "clan" name, the north, south, east and west fronts being apportioned according to the relative geographical position of the clan countries, *e.g.* Campbell to the west front, Sutherland to the north, &c.

4. The centre of each of the pavilions is terminated by a seated figure—composition—eight in all. Their subjects will be symbolical of "Music," "Architecture," "Painting," "Sculpture," "Science," "Literature," "Religion" and "Commerce."

5. The two north towers each have terminal winged figures in bronze, the one of "Fame" and the other of "Immortality."

6. On each of the internal main piers of the central hall will be groups of figures with attributes of the various arts, crafts and trades of Glasgow, each surmounted by a mural crown. Thus one will form a trophy of engineering implements; others of wrights, masons and so forth. In the spandrels of the first-floor arches will be decorated tablets bearing the names of the great musicians—Mozart, Beethoven, Handel, &c.

7. The similar spandrels in the east and west courts will bear the names of historically famous men of Scotland—"Scott," "Wallace," "Bruce," "Burns," "Duncan," and the like—with the dates of their birth and death.

8. The four tower entrances on the east and west fronts will be surrounded with decorative carving in relief emblematical of "Naval and Mercantile Shipping," the centre pieces being formed by the prows of ships and galleons.

In suggesting the foregoing subjects we have desired to indicate a wide recognition of the art work of all countries, and at the same time to keep, so to speak, a thread of national

feeling constantly in view, so that it may be distinctly a Scottish monument. We think the committee will agree with us that, while it should not be stamped as local (in the narrow sense of the word) by the selection of subjects, it is yet right and fitting that Glasgow should be the city commemorated thereby, and it is accordingly in her industries and interests that we have sought our emblems.

Before leaving the descriptive section of this report, we desire to draw attention to the essentially structural nature of the sculpture and carved work in this building. It is no mere filling of panels with ornament which may be left blank or unfinished without interfering with its form or design, but is in every case an integral part of the design, marking points deliberately selected as necessary for enrichment, in order to complete an outline or enforce the simplicity and mass of the adjoining parts. The method of procedure in execution will be as follows:—The master sculptor will undertake the preparation of the clay and plaster models for all parts of the work, and will supervise their execution in stone. He will personally execute the principal group in the arch of the north porch, and (with the assistance of such of the carvers as he may select) the eight chief figures on the pavilions. Six chief carvers will be appointed, who will each, with their own craftsmen, undertake a section of the building, being supplied with models as aforesaid.

Since the appointment of the master sculptor he has personally visited and examined the executed work of the principal carvers of the Glasgow and Edinburgh districts. We think it right to express our gratification at the alacrity with which the principal firms have come forward to work under your master sculptor without jealousy or difficulty. Their desire is evidently not so much to profit pecuniarily as to have some share in the completion of a great municipal undertaking. With such a spirit manifested, the Corporation may be confident that their efforts will result in really fine work. After careful consideration we have chosen for recommendation the following chief carvers. They were selected solely on their merits, and chance to be all of Glasgow:—

1. North façade—William Shireffs, 287 West Campbell Street.
2. South façade—J. C. Young, 187 Dumbarton Road.
3. East and west façades—William Vickers, 221 West Regent Street.
4. The bronze figures on towers and north porch—A. M'F. Shannon, 7 Scott Street, Garnet Hill.
5. Central hall—B. A. M'Gilvray & Ferris, 129 West Regent Street.
6. East and west courts—James M. Sherriff, 20 Canning Place.

We suggest that the chief carvers should each enter into a contract, to be drawn by the town clerk, binding themselves to perform the allotted work at the estimated price, and to complete it within a stipulated time, to the satisfaction of the architects and master sculptor. The latter will, of course, have his own agreement with the Corporation.

The following estimates have been obtained for the work. A competitive system was adopted in tendering, and the rates allowed are, in each case, those of the lowest offerer, the remainder having been adjusted thereto:—

1. Clay and plaster models, and drawings and superintendence (Frampton)	£1,600	0	0
2. Eight figure compositions on pavilions, each 450/. (Frampton)	3,600	0	0
3. Group under central arch of north porch (Frampton)	2,000	0	0
4. Six low-relief spandrels in north porch arches, each 300/. (Frampton)	1,800	0	0
5. North façade (Shireffs)	1,808	1	0
6. South façade (Young)	950	0	0
7. East and west façades (Vickers)	1,090	8	0
8. The bronze figures on towers and porch (Shannon)	850	0	0
9. Central hall (M'Gilvray & Ferris)	825	15	0
10. East and west courts (Sherriff)	370	2	0
To the foregoing amounts should be added a provisional sum for temporary scaffoldings, shelters and sheds for the craftsmen and their models, say 250/., and it would be prudent to allocate a moderate sum for contingencies, say 500/.			
750 0 0			
Total	£15,644	6	0

There is a provisional sum of 5,000/. included in existing contracts, which is, of course, available towards the expenditure proposed.

It should be borne in mind in considering these estimates that cost is entirely a matter of quality in such work. It can undoubtedly be done far more cheaply, and if the committee does not see fit to sanction the proposed expenditure there are two courses open—first, to have the work executed by inferior craftsmen; second, to carry out a portion only, and leave the building unfinished. The first alternative will not, we believe, recommend itself to the committee. The building will be visited and criticised by the artists and cognoscenti of all nations, and

the work must be such as we can show them without fearing its comparison with their own productions. The second raises a purely financial question, which we are not competent to discuss. We can, however, affirm that full value will be obtained for the money spent, and that the work proposed is required for the completion of the buildings. In any case, it is necessary that a commencement should be made without delay, so that the galleries may be completed by the appointed date.

The above report was submitted to the New Art Gallery committee at a meeting on Friday. Before coming to a decision the committee remitted the report to Mr. Waterhouse for consideration.

ARCHITECTURAL ASSOCIATION OF IRELAND.

THE opening meeting for the winter term of this Association was held in the Grosvenor Hotel, Westland Row, on the 26th inst. Mr. R. Caulfield Orpen occupied the chair.

Amongst those present were Messrs. Thomas Drew, president Royal Institute of Architects; W. M. Mitchell, George Ross, M.A., J. H. Pentland (lecturer), J. J. O'Callaghan, C. J. M'Carthy (city architect), T. Slevin, G. M. Ross, M. J. Buckley, T. R. Scott, George Sheridan, G. Sheridan, R. Butler (hon. sec.) and A. E. Murray.

The Chairman announced that the Maguire prize of 10/. for a drawing of a building of style prior to the eighteenth century was awarded by the judges, Messrs. G. C. Ashlin and T. M. Deane, M.A., to Mr. J. Delany. Three sets of designs for a suburban villa were sent in competition for the Ashlin prize of 10/., but the prize was not awarded, on the ground that the plans sent in could not be carried into effect for the sum indicated in the terms of the competition, 2,000/. The prize for the essay on "The Influence of Climate and Material on National Domestic Architecture" was awarded to Mr. R. Butler, 12 Dawson Street.

Mr. J. Howard Pentland, R.H.A., then proceeded to deliver the inaugural lecture on the subject of "Open Roofs." He dealt in great detail with the various forms of roof construction from the earliest ages, illustrating his remarks by sketches drawn, for the greater part, as the lecture proceeded. The term "open roof" he defined as a roof the structure of which was not concealed by a ceiling or other covering. It was used generally in respect to timber and stone materials, but was equally applicable to stone.

On the motion of Mr. J. J. O'Callaghan, seconded by Mr. Geoghegan and supported by Mr. Drew, a hearty vote of thanks was passed to Mr. Pentland.

The building construction class in connection with the Association will recommence on Thursday, November 4, at 22 Clare Street. The architecture and design classes will recommence on November 1. Members who intend to join the classes are recommended to meet on these dates for the purpose of discussing the work for the session.

The Saturday afternoon visits to buildings in course of construction recommenced on Saturday last, when a large number of members visited, on invitation, the Empire Palace Theatre, which has been rebuilt on the site of the Star Theatre of Varieties, Dame Street. They were received by their professional colleague, Mr. Brunton, the architect of the building, and also of many other places of amusement in the three kingdoms. The building is now closely approaching completion under the direction of the well-known and experienced contractor and builder, Mr. Dalton.

TESSERÆ.

A Legend of Cologne.

THE legend concerning the plan of Cologne Cathedral may not be known to every one. It is related of the designer (Heinrich Sunere or Gerhard von Riel) that in despair of finding any plan sufficiently great, he was walking one day by the river, sketching with his stick upon the sand, when he finally hit on one which pleased him so much that he exclaimed, "This shall be the plan." "I will show you a better one than that," said a voice suddenly behind him, and a certain black gentleman, who figures in many German legends, stood by him and pulled from his pocket a roll containing the present plan of the cathedral. The architect, amazed at its grandeur, asked an explanation of every part. As he knew his soul was to be the price of it, he occupied himself, while the devil was explaining, in committing its proportions carefully to memory. Having done this, he remarked that it did not please him and he would not take it. The devil, seeing through the cheat, exclaimed in his rage, "You may build your cathedral according to this plan, but you shall never finish it." This prediction long seemed likely to be verified, for though the building was commenced in 1248, and continued for 250 years, only the choir and the nave and one tower to half its proposed height were finished. The towers were not completed until 1883.

Buildings in Chile.

The cities and towns of Chile, with the exception of Valparaiso, are generally built upon the same plan. The most striking peculiarity is that they are divided into squares of equal size, the sides of which are about 137 English yards in length, and enclose an area of about four acres. Within each of these quadras there are parallel rows of broad and well-paved streets, intersecting each other at right angles. The houses are also built in the form of a square, enclosing one or more courts, into which the various apartments look, and in consequence of the continued dread of earthquakes, they are massive and spacious. Few are erected with a second storey. They are generally built of timber and large bricks formed of mud mixed with chopped straw and dried in the sun. The unoccupied spaces are in most cases laid out in gardens, and adorned with fruit-trees and flowers. In the larger cities considerable taste and elegance are displayed in the internal decoration of the houses of the wealthy, especially of the apartments destined for the reception of visitors. The most splendid public edifice in Chile is the mint, which was built of hewn stone, at a cost of L.165,000, and contains the apartments of the President of the Republic. In ecclesiastical architecture Chile is greatly inferior to most Roman Catholic countries. The majority of the churches are very plain, and the internal decorations, paintings and images are for the most part of a very paltry description. The cathedral of Serena is small, but much admired for the style of its architecture, which, with the light magnesian limestone used in its erection, is well calculated to resist the dangers arising from the frequency of earthquakes.

Unity of Art.

Art, considered under the just recognition of its origin and end, and viewed in its various phases of progress and decay—at one period passing in its strength over one portion of civilised society, it may be in connection with mythic doctrine, as in the poetry of India and the architecture of Egypt, or in elevating the heroic to the divine, as in the sculpture of Greece—presents one great whole, dependent in its several parts upon one bond of connection. But in the face of this, its ubiquity, in one form or another, in defiance of the constantly recurring and ever-living repetition of its effects in different times and modes, in opposition to its indestructibility and the continual exemplification of its reanimated influence; a singular solecism has frequently taken the place of an imperative judgment regarding it; which, although too mistaken to be generally entertained on particular occasions in various degrees and under different modifications, has served to impede the full admission of its influence, and that not merely in connection with notions promulgated under speculative systems of economy, political or moral, which are alone fitted to meet certain data, to run, like fused brass, into their destined mould, and there stiffen into rigid immobility. It has been deemed contingent and unnecessary; its various branches have been separately denied, or even held to be detrimental; one muse after another has been banished from the codes of fanciful moralists and legislators. But life does not acknowledge rules of mental monasticism, and the sisters are often seen whispering in the ears of their repudiators. Happily, man's self-denial of his own faculties and powers does not negative their existence, otherwise his extinction, intellectually, morally and physically, would have been a short process.

Paris Houses.

Practically, at Paris, where from the nature of the subsoil it is expensive to form cellars, and where the bulk of the houses are built upon the ground without deep foundations, where the land is all freehold, building leases are unknown, and consequently where the interest of the proprietors is evidently to obtain the greatest number of dwellings upon the least possible surface, and the houses, therefore, are generally from six to seven storeys high, the lower parts of the houses are built of the roche stone towards the street and up to the first floor, from thence two storeys are carried up in *la pierre franche*, and the remainder is executed in lambourde. The party walls are mostly executed of moellon or small coursed stones, of similar natures to the corresponding parts of the façade. The back walls and partitions are of wood, filled in with light rubble and plastered. Such construction is about as bad as can be; the front wall, built of carefully squared ashlar, sinks very little; the party walls, of rubble and plaster, not only sink more than the front, but from the fact that the plaster in setting expands, it becomes necessary to build these walls totally independent of one another. The back walls, of wood framework, shrink still more. It is therefore almost impossible, in the new quarters of Paris where this style prevails, to find a house which is not disfigured in all directions with cracks and settlements of every kind and size imaginable. The mode of using the stone is, however, logical, and merits imitation. The harder and less hygrometric stones are placed at the bottom as being the most fit to resist the crushing weight and the capillary action of the stone upon the humidity of the soil. The finer grained stones

are employed at the heights destined usually to be ornamented; the lighter and more perishable stones are used above, where they load the foundations less than the others would do, and where they meet with the atmospheric conditions the most adapted to their own preservation.

Aspect of Buildings.

SIR,—May I ask your various readers whether they can give me any advice in the following matter? It is desired to build new workshops for a firm of carvers, and, secondly, joiners and carpenters. What is the correct "aspect" for (1) a carver's workshop, and (2) a carpenter's and joiner's workshop, and can your readers tell me of any modern premises as an example, or of any book published on the subject?—Yours truly,
October 25, 1897. PROVINCIAL ARCHITECT.

GENERAL.

The Rev. William Finch-Hatton has given a fine stained window to the church of Weldon in Northamptonshire. The window belonged to Lord Nelson, and was given by him to Sir William Hamilton, then ambassador at Naples, through whom it descended to Mr. Finch-Hatton. The subject of the window is the Adoration of the Magi.

The Sum of 28,000*l.* has been paid or promised towards the Church Building and Debt Extinction Fund of the Presbyterian Church of England. It is proposed to raise 50,000*l.* in the course of five years.

An Exhibition of lithographs has been opened in the Rue Grange-Bateliere, Paris, by the Minister of Fine Arts. It will be closed on November 6.

M. Alfred Sisley, the French Impressionist, has returned to Paris, bringing with him several views which he has painted in Wales.

The Exterior of the Château of Malmaison has been restored under the direction of M. Humbert, architect, and at the expense of M. Osiris. The more difficult work of restoring the interior is about to be undertaken.

Mr. Thomas Blashill has consented to act as superintending architect to the London County Council for another year, as his retirement would cause inconvenience.

Mr. W. Alexander, of Dundee, has prepared plans for a new theatre which is to be erected in High Street, Aberdeen.

A New Military Hospital, in place of the building for so many years occupied in Portsea, is, it is stated, to be erected on Portsdown Hill, on a site hereafter to be selected.

The Contract for the new water supply of Paris will be let in the course of the coming month. The first section is estimated at about 450,000*l.*

Long Lane, Southwark, is to be widened and Tabard Street continued into Borough High Street, at a cost of 207,400*l.*

An Excursion Meeting of the Northern Architectural Association will be held on Saturday next, October 30, when the new Y.M.C.A. buildings in course of construction will be inspected. The opening meeting of the winter session will take place on November 17.

The Second Ordinary Meeting of the Liverpool Architectural Society will be held at the Law Library, Union Court, on Monday, November 1, at 6 P.M., when a paper will be read by Mr. Huon A. Matear, F.R.I.B.A., on "The Birth and Development of Architecture," illustrated by limelight views.

A Conversazione of the Dundee Institute of Architecture, Science and Art will be held in University College, Dundee, to-morrow (Saturday).

The First Evening Meeting of the Auctioneers' Institute of the United Kingdom for the session will be held in the lecture hall of the Institute, 57 and 58 Chancery Lane, on Tuesday, November 2, at 7.45 P.M., when the president, Mr. James F. Field, will deliver his inaugural address.

The Metropolitan Asylums Board have decided that Mr. Edwin T. Hall, the architect for the new chief office, be paid a commission of 5 per cent. upon the total cost of the works, it being understood that in no case shall this commission exceed the sum of 2,500*l.*

A New Reredos which has been erected in St. Mark's parish church, Shelton, was last week unveiled in the presence of a large gathering.

The Architect.

THE WEEK.

ON Tuesday the question to which we referred last week, whether a summons under section 107 of the London Building Act was legally served when it was merely affixed to the premises to which it related, was considered in the Queen's Bench Division. Mr. MEAD, the magistrate who had declined to recognise such a summons in his court, had made an affidavit in which he said that on September 22 the London County Council applied for a summons under section 107 of the London Building Act 1894. The summons was returnable before him on October 1. It was addressed "To the Owner" (of the premises) merely. The owner was called upon to appear, but there was no response. The complainant (the London County Council) proposed to proceed in his absence on proof that a copy of the summons had been affixed to the premises. It was stated by the complainant that the owner was unknown, but no evidence was given that any steps had been taken to discover him. There was no evidence that the valuation list or rate had been examined, or the rate collector interrogated, or other obvious means taken to discover who the owner was. The complainant contended that the service was sufficient under section 188 (1) of the Act of 1894. The magistrate, however, thought that the service of any summons, even if anonymously addressed—*i.e.* "To the Owner"—was a "notice" the service of which is provided for by the Summary Jurisdiction Acts, and must therefore be served, under section 1 of the 11 & 12 Vict. c. 43, personally or at the last known place of abode. He also thought that even if a summons addressed "To the Owner" in a case where the owner could not be found was not "provided for by the Summary Jurisdiction Acts," there should be evidence before him that reasonable diligence had been exercised by the complainant to discover the owner of the property. He therefore refused to hold that there had been valid service of the summons. Counsel for the magistrate argued that the Council should have endeavoured to discover the owner before Section 188 was applied. Mr. Justice WRIGHT considered there was not a sufficient inquiry after the owner to entitle the Council to act under Section 188. It was necessary to prove the inquiry, then failure to ascertain who was the owner and, thirdly, that the premises were empty before Section 188 was applicable. Mr. Justice KENNEDY concurred. The application for a mandamus accordingly failed.

A SPECIAL sitting of the Eastbourne County Court was held on Tuesday for the trial of an action brought by a local surgeon against Messrs. B. COOKE & Co., contractors, Westminster, for the recovery of 50*l.* as damages for loss sustained by plaintiff. It was alleged that while constructing an extension of the parade the defendants' agents negligently placed certain machinery (a steam crane) adjoining or near to the public road without properly or sufficiently fencing in the same, or taking other and sufficient precautions against accident, by reason whereof the plaintiff's horse took fright and became unmanageable, and thereby occasioned injury to the horse and trap of the plaintiff. For the plaintiff it was stated that the horse was scared by the noise of the crane, but defendants' foreman said that the crane was not working until after the time when the accident occurred, and his evidence was corroborated. The jury found for defendants. It appeared that the contractors had suggested the closing of the road, as it was very narrow, and the borough surveyor admitted they had carried out all that he had asked them. There was also a doubt expressed whether the crane when not in motion was not an object that would frighten a horse unless it was led, especially if travelling quickly, but the responsibility in that case would probably rest on the Corporation of Eastbourne.

A MOST interesting collection of historical documents, autograph letters and manuscripts is now on view in one of the rooms of the Fine Art Society in New Bond Street. It covers over three centuries, and includes specimens of holographs and signatures from the pens of all the

influential royalties, statesmen, warriors, authors, actors, painters, ecclesiastics and musicians of that time. Some of the letters are of vast political importance—a few of them revolutionised the world and changed the complexion of society for ever; others give rare glimpses of the hidden home life, while many reveal the writers in a way that narrowly escapes a breach of confidence. To whom the exhibits belong is not generally known. It only concerns the public to bear in mind that they are for sale, and that particulars of the prices of one, many, or all are to be had for the asking. Order being "Heaven's first law," it seems somewhat of a pity that a more definite system of classification was not adhered to in the arrangement of this unique collection.

AN elaborate paper upon "Sea Defences" was read by Mr. R. F. GRANTHAM before the Society of Engineers on Monday. It did not relate to the preparation of ships or other aids to warfare, but to embankments, upright stone or concrete walls and groynes of timber, stone or concrete. Mr. GRANTHAM was rather pessimistic or rather concluded that England is not wealthy enough to resist wave power. According to him, "The great hindrance to the adoption of any kind of effectual protection against the encroachment of the sea, except for residential property, is the cost. No frontage of agricultural land, except where a considerable area is below the level of high water, can bear the cost of any substantial form of defence hitherto devised. It is cheaper to sacrifice the land." But, as it is a national belief that Britannia rules the waves, something ought to be done by Government to obviate the necessity of so often removing coastguards' stations owing to the encroachment of the sea. Mr. GRANTHAM desired special attention should be given to the following considerations:—1. The protection of the coast line is in most cases dependent on the sand and shingle that can be arrested and retained in front of it. 2. Groynes, unless there is a foundation of rock, are in most exposed places indispensable, whether there is a sea wall or not. 3. Where there is a sufficient supply of drift along any part of the coast, groynes alone, if properly planned, will prevent further encroachment without a sea wall or breastwork. As sand and shingle are the most important elements in the protection of the coast, their removal in large quantities weakens the natural defence of the coast line, and ought in all cases to be stopped. West of Selsea Bill Mr. GRANTHAM found that shingle was being taken for repairing the parish roads, and that barges were removing 100 tons of shingle per week from the Spit at the mouth of Chichester Harbour. On his advice the lords of the manor prohibited the practice. A similar custom prevailed on the Yorkshire coast, and the trade in shingle was largely developed by the opening of the Hull and Holderness Railway. The Board of Trade put a stop to it, the late Sir JOHN COODE's evidence being that "if the shingle continued to be removed the port of Hull would be endangered, and that materially so."

THERE is hope for Mexico, for it has not only given a chance to all the world to compete for the legislative building, but it has decided to preserve the archaeological remains which are a puzzle to foreigners as to natives. By a recent decree of the Mexican Government all antiquities, manuscripts, idols, amulets and other objects or chattels which may be found of interest for the study of the civilisation and history of the aborigines and ancient settlers of America, and especially of Mexico, cannot be exported without legal authority. Under the head of archaeological monuments will be comprised ruins of cities, casas grandes, troglodyte habitations, fortifications, palaces, temples, pyramids, sculptured rocks or those with inscriptions, and, in general, all edifices which under any circumstances may be of interest in the study of the civilisation and history of the ancient inhabitants of Mexico. The destruction or injury of a monument is also constituted an offence against the law. Hitherto Mexican antiquities could hardly be considered as subjects for serious study by archaeologists in general, for those who attempted to trace the origin of the remains only increased the mystery. Now that prehistoric archaeology is placed on a more firm basis, it is possible that a systematic investigation of the Mexican monuments would lead to more satisfactory results.

ARCHITECTURAL ASSESSORSHIP IN AMERICA.

AS our readers already know, no more than a few weeks have elapsed since the competition for the Philadelphia Capitol, which so many American architects believed was to inaugurate a new era for the profession, ended in a fiasco. But in the States all things move quickly; law itself can have no delays, and short as has been the time since the competitors were disappointed it has sufficed to enable all the circumstances to be investigated in the law courts, for a judge to consider them at his leisure, and for an elaborate judgment to be prepared and delivered. The affair has interest of its own to all architects who take part in competitions, but especially for English architects, since the manner of arriving at judicial conclusions in the United States is derived from English practice, and it would not be considered irregular in the Queen's Bench Division if one of the judges were to refer to an American decision in support of his own views.

It may be as well, in order to make the judgment clearer, to state the case briefly. The Commissioners for the Capitol, having special powers under an Act passed in April, 1897, invited architects to send in designs for the building. They announced that six experts were to be appointed as assessors to examine the designs. The experts were to select eight designs which appeared most suitable, and to distinguish them in the order of their merit. After a consideration of the report and recommendations of the experts, the Commissioners were to select that one design among the eight which they considered most satisfactory, and to award to the author "the prize of the competition by designating and appointing him as the architect of the legislative building." To the authors of the designs placed second and third in the competition medals were to be given. Designs came in, were submitted to the experts, and the report and recommendations were duly prepared. But, as we announced, the Commissioners could not screw up their courage to the selecting point. However, they performed a more hazardous act, for they cancelled and annulled their own programme, and in that way fixed a stigma on American government.

In all countries honest men are supposed to hold to the obligations on which they enter. If judged by ethical principles, there can be no question that the Commissioners are guilty of discreditable conduct, for they have inflicted serious loss upon a number of their countrymen. There is rothing in the American constitution, so far as we know, which allows architects to be chosen as the victims of men in office who are weak or callous. But when architects happen to be victimised, is there any power in the Courts to redress their wrongs? Two firms of competitors, viz. Messrs. COPE & STEWARDSON, of Philadelphia, and Messrs. ALDEN & HARLOW, of Pittsburg, resolved to test that question. Accordingly, they appealed to the Court of Common Pleas. They submitted statements explaining the great and irreparable injury they sustained, and their losses in preparing designs. They asked the Court to compel the Commissioners to carry out obligations which were solemnly incurred.

There were originally five Commissioners, but one of them—his name should be recorded, it is DANIEL H. HASTINGS, and he is the Governor of the State—could not stoop to trickery and withdrew. It was, therefore, a dauntless four who had the hardihood to plead in demurrer that the Court of Common Pleas had no jurisdiction in the case, that the plaintiffs had no grounds to entitle them to relief, that they, the four Commissioners, formed a deliberative body invested with the power of selecting an architect, and that their discretion could not be reviewed or controlled as a consequence of any application on the part of the plaintiffs. In other words, every puny authority in America is so constituted as to be incapable of doing wrong, although much suffering may be caused by its acts.

The case came before Judge SIMONTON on October 2, and it was agreed by the parties that he should be able to consider the report of the experts and other documents relating to the Commission. After a consideration of arguments of counsel and the documents, the Judge has issued a very elaborate decision.

It is pointed out, in the first place, that the Act of April 1897, which gave rise to the proceedings, is to some extent mandatory. The site of the building is designated,

the style of architecture is prescribed, and a limit is fixed to the expenditure. Among the matters left to the discretion and judgment of the Commissioners are the size and form of the Capitol, the employment of an architect or architects and the adoption of plans for the construction of the building. That discretion, said the Judge, must be exercised by them alone, and cannot be committed to any other board or person, for as was declared in *LYON v. JEROME*, which is the ruling American case:—"From an early period of our law this rule has been laid down as to powers given by will or deed to executors, trustees and attorneys to sell land, make leases, &c.; and modern decisions have extended the principle to the less formal appointments of factors, brokers and other lawful agents. How much more strongly, therefore, must the rule apply to the delegation of authority by the State to its high public officers made with the solemnity of a legislative act?"

In spite of the solemnity of their constitution, there can be no doubt, if words are to be trusted, that the Commissioners had decided on a delegation of their authority. When, in the conditions of the competition, it was stated that some one of the eight designs selected by the experts was to be adopted and that the commission to design and supervise the erection of the building was to be given to the author, that was a delegation of authority. The Judge, in fact, has to admit that the provisions in the programme "certainly tend to give weight to the argument that the primary purpose of the competition was to procure plans for the Capitol buildings, coupled with the provision that the author of the plans accepted should be employed as the architect to carry them into execution."

At the same time, Judge SIMONTON considers that the principle involved in competitions is not sound. "We do not believe," he says, "that any business man of ordinary discretion about to expend the sum of 550,000 dols. immediately, and perhaps twice that amount prospectively, would select and employ an architect to prepare plans and supervise the erection of buildings to cost that amount without ever having seen him, without any knowledge whatever of his character, his habits, his executive ability, or his pecuniary responsibility, or any other knowledge of his fitness, except that to be acquired from inspecting a plan for the buildings drawn by him." But the contingency of the successful designer being ineligible was foreseen, for in the conditions it was provided that in such a case the prize-winner was to 'associate with himself in the performance of his duties an architect who shall be acceptable to the Commissioners. And such associated architect shall be paid a portion of the fee provided herein to be paid to such appointed architect, such portion to be as agreed upon by both architects, or in the event of their failure to agree, then as fixed by the Board of Experts."

The Judge may be right in holding that it was unfortunate that such a scheme was adopted, but an agreement is an agreement, and should be invincible.

The argument of the Attorney-General was that the Commissioners did not abdicate nor delegate the powers vested in them. But Judge SIMONTON could not close his eyes to the fact that "if it be their duty to select one of eight nominated by the Board of Experts, they have certainly precluded themselves from exercising an independent judgment and from giving only the weight to the opinion of the experts to which, in the exercise of their sound judgment and discretion, they may think it entitled." The Commissioners also were lax in their action when they confined themselves to the nomination of one out of the six members of the Board of Experts. Here again the Judge acknowledges that he is unable to see how it can be even plausibly argued that a delegation or surrender of discretion was not implied.

It is evident that Judge SIMONTON considers that whatever may be done in the way of delegation by the individual members, the Commissioners as a body could not delegate their discretion. Various precedents were cited in proof. In one case where canal commissioners were authorised to take possession of lands required, it was held that the engineer could not enter on the land of an individual except by express direction, although the construction of the canal was confided to him. How American works can be executed with despatch with such obstacles is against an Englishman cannot understand. Fancy railway directors

having to formally enter on every field through which their line is to pass before a sod could be turned. In another case where a common council by resolution directed a superintendent of streets to have certain sidewalks formed, one of the inhabitants refused to allow the work to be done in front of his premises, and brought an action to assert his right. The Court upheld him on the ground that the power conferred must be exercised by the council alone, and could not be delegated. If municipal authorities have to superintend every detail of the works in towns, it is no wonder they try to make illicit profits to compensate them for their labours. The Commissioners of the Philadelphia Capitol through the agency of a Board of Experts inflicted wrong on architects; but as the Act had no clause relating to experts, and, moreover, according to the common law, discretionary power cannot be delegated, therefore the Commissioners are completely innocent. If we say they were not impartial, and were seeking their own ends, the words do not apply to them even in a Pickwickian sense. They are not absolved, for as Commissioners they could not offend.

There was no other course open to Judge SIMONTON than to play the familiar game of see saw. As individuals the Commissioners did not fulfil the duties entrusted to them, but being infallible as a Commission they were above all lapses. A judge was therefore bound to approve of all the license and irregularities which the law confers on public bodies. "We are concerned with the legal questions only," says the Judge in coming to an end, "and have nothing to do with, and express no opinion upon, the propriety of the action, professional or other, of either or any of the parties to this controversy." The Judge could not declare the demurrer to be sustained and mulct the complainants in costs, without suggesting there was little difference between plaintiffs and defendants. We suppose Judge SIMONTON had been studying some of the remarks of English judges about the professional practice of architects. On both sides of the Atlantic justice, in dealing with architects, is not entirely exempt from prejudice. But nothing which a judge can do is so much of "a delusion, a mockery and a snare" as assessorship in the United States.

THE SENAMS OF TRIPOLI.*

A REPRESENTATIVE of Tripoli or the Barbary States who visited London in the last century described a sort of Pompeii in his country, in which all the former inhabitants and the animals were to be seen standing as petrifications, just as they appeared at the moment of the visitation. There was nobody in England, not even any of the men who were once in the hands of the pirates, who was competent to cast doubt on the story. Travellers in those days did not venture beyond the coast of Tripoli, and in our time so few care to run the risks of a journey in the interior, it was hardly necessary to prohibit explorations by Europeans. It is therefore still possible to talk about the wondrous petrified city of Rassem with as much confidence as was shown by the Tripoline. He might be imposed on by a fiction, for probably he was as little acquainted with the whole of his country as any Londoner, but it is as likely he was only giving a misinterpretation of a spectacle which, if seen from a distance and under certain atmospheric conditions, would appear to be intended to deceive the senses. The petrifications may have been no more than a group of limestone senams resembling those which Mr. COWPER has the credit of describing correctly for the first time.

What is a senam? The word is supposed to signify an idol, but it may be only a modern Arabic term. The object generally consists of two standing stones, from 6 to 15 feet high, with a lintel on top. If monoliths were not obtainable, then the uprights were formed of a few large stones. In most places there is evidence that the trilithic unit or element was part of a series which formed the boundary or enclosure of a space that was commonly rectangular. If the stones on Salisbury Plain were not subjected to the

wear and tear of our insular climate, and preserved their arrises as they left the quarry or the hands of the primitive workmen, there would be some analogy between them and the senams. As they appear in the reproduction of Mr. COWPER's photographs, the senams can hardly be considered as "rude stone monuments," for they suggest that

SENAM TERRIGURT.

Roman masons, who were undoubtedly employed in the interior of Tripoli in days when it was not all a desert, must have aided and abetted in giving more regularity to the Tripoline enclosures than is found in the stone circles of Western Europe. Yet it is not unlikely that the senams existed for many a century before Roman power was exercised in the region. The first impression, however, which a view of one them gives is that the system is the creation of a carpenter rather than of a mason. The post and lintel arrangement has much to do with such a conclusion, but what appears to add to the certainty are the square-cut holes which so often appear in the upright stones, and suggest mortising. If the senams formed a fence, there were horizontal as well as vertical obstacles to escape from the area enclosed.

If we assume we have a fence, for what purpose was the part used which it surrounded? It would be absurd to believe that so much stone and labour could be employed to form a pen for cattle. Almost instinctively, archaeologists of all countries and dispositions conclude that enclosures like those of Sardinia, Brittany and Wiltshire were constructed to aid in carrying out religious rites. Tripoli was not beyond an influence which is inherent in the human race. If it did not form a part of the possessions of Carthage, it could hardly escape from the propagandism of the city. But it was always easy to find a creed to excite terror of the unknown. People of the Semitic race, who wished to have enduring memorials or symbols of their belief, and were incompetent to carve figures of men or inferior animals, found it was necessary to make the best of plain stone. A single monolith set up sometimes served, but there is no reason why two or three should not also be as effectual and more impressive. A series of senams could, therefore, become a series of idols, and at the same time guard or girdle some sacred spot of earth. But let us hear what Mr. COWPER says:—

When I first suggested, before the Anthropological Section of the British Association, that in the trilithonic senams of Tripoli we see symbolic structures, if not identical, at any rate nearly akin to the mysterious *Asherim* of the Baal worshippers, I did so with much diffidence. But subsequent consideration, and a second visit to the country and to numerous other sites, have not shown any reason to withdraw the suggestion. That the "Asherah" symbol, which was an idolatrous emblem of Ashtoreth, the nature goddess, "the abomination of the Sidonians," by whom all sensual desire was kindled, shou

* *The Hill of the Graces: a Record of Investigation among the Trilithons and Megalithic Sites of Tripoli.* By H. S. Cowper, F.S.A. With ninety-eight illustrations and a map. London: Methuen & Co.

take such a form as we see in the senams and in the Babylonian seals, is surely probable enough; and its position upon the latter in juxtaposition with the cone-topped column, which is unquestionably phallic, is alone suggestive as to its significance. That the "Asherah" was of wood, and not of stone, only renders more significant the fact that the senams themselves seem copied from wooden types.

If yet a little more theorising may be excused, it may be pointed out that the angle-cut holes on the altar side of the senams are well adapted for erecting a wooden structure, such as appears to be indicated on the Babylonian seals, and joining it to an enclosure in which might be enacted some of the terrible rites of the faith of Molech. If the passage between the senam jambs was that by which the victims were passed by the priests, and the lateral holes contained bars which could then be shot, signifying that the world was left behind, we may imagine a terrible explanation of the mystery. The passage through the jambs would thus signify regeneration or new birth, which was to be followed by either sacrifice or by the purifying rite of passage through the fire; for although the passages are so narrow that they could not be used as ordinary gates, they were wide enough for this purpose, for the sacrificial victims were always youthful.

SENAM EL-KHAB (M'SALATA).

In connection with this, the world-wide custom of squeezing between clefts in rocks, between the columns of mosques, or through holed stones for the cure of ailments, should be noticed. All these were originally symbolical of regeneration, and such was probably a part of the "Asherah" ritual, and, if there be anything in the above suggestions, of the senams as well. In the case of a purificatory rite by fire, there would probably be room between the senam and the altar for two fires side by side. . . . Glancing at all the evidence before us, it is impossible to resist the conclusion that whether appropriated to any form of Baal cult or not, such a strange combination of rude megalithic forms, advanced knowledge of masonry, and evidence of an organised ritual must have been the outcome of contact between some barbarous or semi-barbarous tribal population and some highly cultured race. That it was the Libyan races, who we know occupied this territory which constituted the first element, there is every reason to believe; and that the other influence was the result of the Sidonian and Phœnician colonies which at an early date were formed for mercantile purposes upon this coast, there seems from the above mass of evidence, at any rate, a strong presumption. It may have come from Egypt by some earlier and unrecorded migration, but at present the evidence at hand does not point to this; but at any rate we have in these monuments a most remarkable link between the great stone building age and ancient Eastern civilisation.

It is a pity GUSTAVE FLAUBERT was not acquainted with Mr. COWPER's discoveries, for then we should have incidents introduced in "Salammbô" that were suggested by

the senams, or it may be some of the details would be modified. For example, if MATHÔ had to run the gauntlet along a screen of senams prior to receiving the *coup de grâce* from the sacrificial knife, the openings would allow of spear thrusts from the excited crowd, but in such a way as to lengthen the spectacle afforded by the torture of the victim.

Mr. COWPER was enabled to visit seventy-six sites and, as he says, "a very large proportion contained features of the senam type." In the Tarhuna plateau they were most numerous, but the most remarkable were found in the Wadis Doga and Terr'gurt. There is variety among them, but likewise general characteristics. According to Mr. COWPER they show some or all of the following features:—(1) Rectangular enclosures of good ashlar masonry, often of large size and subdivided; (2) a subdivision of this enclosure by square columns; (3) megalithic gate-like erections, always placed in or close to the walls of the enclosure; (4) altars; (5) stones of obscure use; (6) Roman work; (7) sculptures; (8) graffiti; (9) castle-like buildings; (10) detached enclosures.

The appearance of the senams amidst the desolation of the desert must have a startling effect, but they are not the only remains of antiquity. Mr. COWPER also gives illustrations and descriptions of Roman work over which time cannot prevail. It is in such cases the greatness of architecture is manifest, for the buildings seem to have conquered fate. At Lebda (Leptis Magna) a ruin is seen which in the doorways at least suggests Greek influence. Occasionally examples of sculpture are found which are treated ignominiously. A copy of the *Venus of PRAXITELES* was among the victims. At Tarhuna a marble relief was discovered which Mr. COWPER was able to secure. The treatment is not common, although not unique, and suggests some of the playfulness which inspired the Tanagra statuettes. The relief measures 28 inches by 36 inches, but

MARBLE RELIEF FOUND IN TARHUNA.

it may be only part of a frieze. The subject is supposed to be the Graces.

There is much else in the book which will have novel interest for the architect and the archaeologist. Tripoli is at present beyond the tourist's world, and apparently has not the least importance to an English politician, although it may one day become the battle-field of rival European States. Mr. COWPER has excited interest in the country, and it is not likely until the Sultan is evicted that another traveller will be able to add much to the information he has imparted in a most agreeable form.

The Congregation of the Wharton Presbyterian church, Little Hulton, one of the oldest Nonconformist churches in Lancashire, have decided to erect another place of worship, in consequence of the undermining of the present structure by the coal mines in the vicinity. The church at Wharton was established in 1662, and the present building was erected in 1723, since which time it has frequently been repaired and altered.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE first general meeting of the Institute of Architects for the session 1897-98 took place on Monday evening last, Professor Aitchison, A.R.A., president, in the chair.

The President congratulated Sir John Taylor on having received the honour of K.C.B., and then delivered the following opening address:—

The President's Address.

When I had the honour of addressing you last year, I chose a subject with which I felt sure you would all agree, as it was the recounting of some of the architectural triumphs of the past and the pointing out of some of the services architecture has done for those nations where it flourished. These services include the usefulness of the monuments at the time they were built, the adorning of the country and the keeping of a record of that nation's greatness, of its peculiar characteristics and of its position in civilisation. I thought that the first utterances of a new president should be as free as possible from controversial matter; but, after a year of office, the president becomes conversant with the wants and possibilities of the society. I now propose that we should consider how the Institute can, with a reasonable hope of success, improve the art it was specially created to cherish and advance.

The unravelling of the great problems of humanity and the extraction of the lessons they teach are beset with difficulties, and some of these difficulties are apparently insuperable on account of our ignorance of the factors. Sometimes the glimmerings of light that the most perspicacious can see turn out to be not those of the dawn, but of mere will-o'-the-wisps, as in the case of Macchiavelli's works. Macchiavelli saw exactly what men did, and was not led astray by what they ought to do, and in the problems he set he saw the solution wanted, but misled by the ruthlessness of nature, he overlooked the supreme importance of how the end was attained; so that the old adage, "Let justice be done though everything perish" is a more useful maxim for mankind to follow than to attain its object by wickedness.

We cannot suppose that among the two parties who alternately govern us, and help to mould our minds, to direct our aims, and to modify our desires, there are not on both sides upright and devoted men, whose views are as the poles asunder; and it is only by long experience that the value of the measures carried can be judged of.

At the time of the discussion of such measures the partisans of the scheme are as sure of its excellent results as their opponents are of its pernicious effects, and as the clashing of the opposing views causes heated, angry and acrimonious debates, so I fear that suggestions of improvement may have the same effect amongst us.

In considering architecture, as in considering every other transcendental pursuit, we must take the existence of two things into account, namely, the set of the public mind and the occurrence of genius; and though we most urgently want genius in every branch of skill and knowledge, we have not the faintest notion of the causes of its production. The utmost we can do is to offer it ample opportunities of learning what it wants to learn, and to bestow our thanks and admiration upon its possessor and his works.

The other cause of excellence is the set of the public mind in a certain direction; but why it sets in that direction is at present unfathomable, though we may roughly indicate that its set is always towards those pursuits that promise power, wealth and delight. We may, however, say with certainty that in this age it does not set in the direction of architecture. If the genius of all the great architects that ever lived were combined in one, and that one had the chance of showing it, the architecture that he would produce would have little or no effect on the public, for the public now gets more, in that direction, than it either desires or deserves almost for nothing, and is perfectly ungrateful. The set of the public mind is so important a factor that we can hardly overestimate its importance. Men whose turn of mind is in the line of that of the public generally decry all attempts at systematic teaching, and proclaim that all schools and universities are mere shoddy-making factories that turn out a colourable imitation from waste.

When in the past there has been a sudden demand by a city or a nation for some kind of knowledge or skill of which there was a deficient supply, the head of that nation or city had no better remedy to offer than the creation of schools, academies and universities, where the requisite knowledge and skill should be taught or tested, and where it was hoped they might be learned. This was the method adopted by Constantine the Great when he chose Byzantium for the capital of the Roman Empire, and caused to be built there copies of the senators' houses in Rome, and of their villas in other parts of Italy. We know that in his time the art of sculpture had so declined that the statues and bas-reliefs had to be taken from Trajan's Forum to form the adornments of his own triumphal arch, and that the sense of propriety had so decayed that there

was no outcry against such folly; and though there was then a large influx of architects and skilled workmen into Byzantium, the work was so hastily and so unskillfully done that eighty domes are said to have fallen during his lifetime, and many buildings had to be pulled down in the time of his successors. So apparent was the want of competent architects and skilled workmen, that he offered a premium to those who would have their sons brought up as architects, and to skilled workmen who would bring up their sons to their own trades. With this object he started schools in Italy and North Africa. May we not say that Santa Sophia, one of the masterpieces of the world, was the outcome of this teaching?

After the irruption of the barbarians in the West there was a great want of both architects and skilled workmen, and the ecclesiastical authorities endeavoured to supply that want by founding schools in their abbeys and monasteries. Again, at the time of the Saracen irruption there was a dearth of architects and skilled workmen, for these energetic savages came at once from poverty into fabulous wealth, and wanted mosques for their new religion and palaces for their kalifs, sultans and great men; and this want was tried to be met by schools and universities connected with the mosques; and there was again the same want in the days of Charlemagne, and to meet these wants the same methods were adopted. I fancy that all the systems but one offered teaching to all who came, and, I presume, who showed some aptitude; but Constantine, who was certainly an able man, only offered his premiums for learning architecture to young men of eighteen years of age who had received a liberal education—whatever that meant then or may mean now.

Looking at the enormous extent of the knowledge required by an architect, and the almost antagonistic powers of mind required, would it not be better to confine architectural teaching to architecture?

As architecture is pre-eminently a constructive art, construction should certainly be its foundation, the very last thing that would be thought of now, for the æsthetic architect would leave that to the builder and the engineer. It seems ludicrous not to insist on an architect who is to build having such knowledge of statics as to know the proper method of resisting the force of wind, of water and of earth, and the thrusts of arches, vaults and domes. Statics would give us too important lessons in æsthetics, for it gives us the proper proportions of each part of a building when we know the height, the weight to be carried and the strength of the material to be used. When these particulars are known and provided for, we may roughly say that we have only to accentuate the important part by mouldings, or have them adorned by the sculptor to make it into architecture.

The architectural student wants also to know how to plan conveniently and beautifully, to make his building wholesome, and finally to give it the shapes and ornaments that proclaim its destination, and are appropriate to that destination, and—"all the rest is leather and prunello." The literary, goldsmithing, painting and modelling architects of the Renaissance left us one pernicious legacy, for their aim was to imitate Roman architecture, and from their teaching the Gothic revivalists have wanted to imitate Gothic, and the Greek revivalists have wanted to imitate Greek, though the Italian Renaissance architects gave grace and artistic perfection to their Roman models.

This procedure of imitating the construction and æsthetic expression of a Pagan people who flourished 1,200 years before the Renaissance seems to me to be a mistaken one, for architecture is a progressive art, not only in the scientific part of construction, in the increase of material wants and the introduction of new materials, but also in the æsthetic part; for no two successive generations like exactly the same forms, nor are the emotions that should be raised exactly alike. You certainly should not ignore the advances made in the architecture of the immediate past. Between the Pagans of ancient Rome and the Renaissance there had been Christian Roman architecture, the Byzantine, when the dome took so prominent a part; there had been Romanesque and Saracen architecture; there had been Gothic which abandoned the opposing of inert mass to thrusts and used counterpoise, and showed a constructive skill never equalled till this age of iron; Gothic, too, had tried to express in its churches its ideals of knighthood and of Roman Catholic Christianity. It was certainly not wise to ignore former advances in construction, and it was hardly possible to go back to pure Roman Paganism, however hard the Renaissance men tried. If we want to advance we must follow the example of the Mediævals; we must study deeply, observe accurately, reason logically, and be never deterred by failure, and endeavour to express the leading character of our time, which, I fancy, is the getting an insight into nature's laws and applying them to our own wants. We must, too, endeavour to discover what in the heavens above, the earth beneath, or the waters under the earth we and our employers love to see embodied in our works, and how this embodiment should be expressed.

In England we have artificially divided the constant

increase of skill and knowledge, and the fluctuation in taste of the Gothic architects, into styles which we call Early English, Geometric, Decorated and Perpendicular. I want you to observe that these so-called styles were gradual developments. The first Gothic architects developed the mouldings of the Romanesque; the grouping of two or more lancet windows under an arch suggested a hole in the spandrel afterwards cusped with the new Saracen feature, and so on; and as skill increased and taste decayed the tracery of the enormous perpendicular window grew mechanical and ugly. It is only by increase of æsthetical and constructive knowledge and the development of necessary features that any characteristic features of our own can be stamped on our architecture.

When a race has had enough wit to invent mouldings on which the sunshine of its own country played the harmonies that it loved, how can these mouldings be transplanted into another country with a different atmosphere and a different sunshine, and produce the same effect? And if they could, are these the precise effects we want to produce now?

Any one who can appreciate the beauty of mouldings, and has seen Greek architecture at Athens, cannot fail to observe how absolutely ineffective these mouldings are in the misty atmosphere of London, particularly when there is no sunshine. The only other architects who understood the art of moulding were those of the Middle Ages, after what we call Gothic was developed; their mouldings are perfectly effective in misty weather, but are too coarse and hard when there is full sunshine, while they are at all times wanting in grace. Yet I may say that the art of moulding is as much neglected now as the science of statics.

No one can give genius, nor does it seem in one man's power to turn the desires of mankind in the direction he desires. You can, however, try to drive away from the profession, by a thorough examination, all those who do not love architecture better than anything else, and though this love does not always insure the possession of genius, it mostly does. Having got the proper sort of men, you can see that they have that necessary knowledge and skill that would enable them to use the divine spark properly if they have it.

Ben Jonson repeats Horace's adage that "the poet is born and not made," but he adds, for all that, a poet wants a good deal of making, and it is the same in all the fine arts. In painting and in sculpture the student with a passion for either does not come fully armed, like Athené from Zeus' brain; anatomy has to be laboriously acquired, as well as the power of drawing or modelling the perfect human form; the art of composition has to be learned, as well as what sculpture and painting can properly represent. Architects are not born with a knowledge of statics, nor of the strength of materials, nor of the art of planning, nor of how to express the emotions that each particular structure should evoke; though we now see ornaments from the palaces of the Cæsars, or from the boudoirs of Renaissance beauties, lavished on tailors' or oyster shops and on banks and insurance offices. I have seen the ghastly ornaments of Roman temples, bullocks' skulls, on a bank, but I looked on these as the monograph of the architect.

This Institute is a university—*i.e.* it does not teach, but it examines and informs students what they should know and where some of this information can be got. Amongst some the idea of teaching is almost a mania, and I admit that some things must be taught; the pronunciation of foreign tongues, the use of a foil or an oar; but as far as I know the art of teaching is mainly non-existent. My experience of school teaching is this. I was put under a man who had mastered the subject I had to learn and who was armed with a stick. He told me to learn a piece out of a book and he allowed me what he thought was enough time to learn it in. If I did not know it, I was soundly beaten, and without doubt this is a great stimulus to exertion. Lucian, of the Dialogues, was supposed to have a taste for sculpture, but his master thought he had not striven enough and as he had broken a piece of marble too gave him so severe a beating that he abandoned the art.

Unfortunately, no real text-book has been written on architecture, though all but how to produce the emotions proper to any structure may be picked up from various books. Those architects who can produce the proper emotions have something else to do than to explain the means they employ, even if they could explain them. And the knowledge, too, of the means used to produce emotions will not give the power to produce them, or else all the real critics of æsthetics would be poets, painters, sculptors, architects or musical composers as well. You cannot suppose that those artists who have excited emotions have not tried to learn all they could from their predecessors. In the case of the poets, at least, we know that they have studied the works of their predecessors, and translated them when in foreign tongues, and paraphrased them when in their own; and though Horace's maxim is excellent, that "If you want to make your hearers cry, you must cry yourself," yet even when he did cry he had to learn the precise mechanism for causing his hearers to weep. Architects must study and paraphrase those buildings and those members of buildings

that have produced the proper emotions in them. An architect must also recollect that those who are to be moved by his building are not Greeks, Romans, Mediævals, nor Italians of bygone ages, but the people of his own country and of his own time. Still if you can touch the master chords of humanity, they are not so very differently attuned now from what they were in the earliest times, or else we should not laugh at the wit of Aristophanes, of Rabelais, of Swift or of Molière, nor cry over the pathos of Homer, Æschylus, Sophocles, Dante or Shakespeare.

We can at least see that an architectural student has the knowledge that he cannot properly do without, and we shall find that this alone will have a very good effect on the profession; but it is almost impossible to divest men's mind of cant. The student is asked to know all sorts of things, some of which are interesting, some pleasant and some dull, that have no bearing on architecture. It is interesting enough to know that hazel nuts were shipped at Barcelona and currants at Patras, but we use neither dry nuts nor currants in architecture; it is pleasant enough to understand Greek, Latin, Hebrew and Sanscrit, French, Italian, German, Spanish, Portuguese, Russian and Arabic, but they are no more architectural arts than the broad-sword exercise or being able to shoot flying. It is interesting to know who built the Parthenon, or the Pantheon, or King's Cross, but it is no more architecture than playing on the fiddle or dancing the polka.

We believe that nature perfectly adapts all her living works to the actions they have to perform without waste of material, and while some are exquisitely beautiful, some majestic and some comic, others are commonplace, and some are repulsive, hideous or frightful; but they all have character. It is only by studying nature's works and former buildings, and deducing laws from them, that we can hope to cultivate that sense which makes us like one form and detest another, so I think that such a study is necessary for those who wish to become architects; for though a knowledge of statics will make our buildings safe and prevent a want of due ratio between the parts, we must trust to a cultivated eye, till the laws are discovered, to make them beautiful, majestic, or sublime. We should, I think, make our students first design in old-world materials—wood, brick, stone and marble—so that their designs can be compared with the existing successful monuments; but we have new materials, which have to be brought within the pale of architecture.

In my opinion we cannot do better than make students design in cast-iron when they have succeeded in designing in old world materials. It is too expensive a material to disregard its statical conditions. It is difficult to arrange a column or a stanchion so that its capital may securely carry a heavy superstructure with a large base. It is difficult to make the base of this column or stanchion wide enough to transmit safely the weight it bears on to a foundation of much softer material; there are difficulties in the design of mouldings and floral ornament that can be cast; and there are absolutely no examples to imitate, so that the knowledge, care, skill and invention of the student are called into play. We cannot believe that the ingenious Mediæval architects would have foregone the use of such valuable materials as wrought-iron, cast-iron and steel, on account of Mr. Ruskin's objection that they were not mentioned as building materials in the Bible.

It may be truly said that nothing can be effected in a structural art like architecture by talking; but when a man is lost in a wood, and you can direct him to the road out of it, you have done him most effectual service. Architecture has been in a wood since the fifteenth century, and it can never progress until it gets out of this wood. The intelligent architectural student wants to know the mark he is to aim at and how he may hit it, and I am afraid the general opinion would be that he is to learn to sketch in perspective, and when he asks what he should sketch, he would be told everything that appears to him interesting, striking or beautiful, because when he gets into practice he will find that the public may ask him to build in any style the world has known. This is a good instance of the ignorant instructing the wise. He should be told that he has first to learn how to construct, and that the aim of architecture is to make of each building an organism like nature's, fitted to fulfil its duties as perfectly as possible without waste of material, and to make it properly tell the tale of its purpose or purposes, and if sculpture and painting can be afforded, he is to use them to tell its tale more completely.

When the Associate's curriculum is amended I would reduce the examinations to two, a matriculation examination and a final one, for two reasons—first, because time would be saved, and, secondly, so that each student might keep up the knowledge and skill he had acquired. Professor De Morgan used to say that when an examination was passed, the students thought all the knowledge required for passing it might be forgotten, and looked on his asking again for subjects they had once passed as a fraud, as if they were asked to pay a second time when they had the receipt for the first payment. The final examination should include a certificate that the candidate has acted as clerk of the works on some building for at least

six months, to familiarise him with real work, and to impress on his mind that it is building and not drawing that is wanted. These amendments would greatly improve the condition of architecture; but architecture would be more improved if there were an examination of Fellows as well. The complaint is that there is a dearth of Fellows, and a proposition is made like that adopted by the giver of the Scripture feast, that we should send into the highways and byways and compel them to come in. There would surely be no need of compulsion if it were felt to be an advantage and an honour to be a Fellow. It has been said that eventually every Fellow must have been an Associate, but the present conditions of the Fellowship offer a way to escape examination. No one, I imagine, objects to see really distinguished architects being admitted by acclamation; but at present there are only three real qualifications for the Fellowship—that the candidate is thirty years of age, is honest, and has been seven years in practice; though it is true that the Council look at the drawings turned out of his office. Some one said of a Prime Minister in Cobbett's day that he was honest; to which Cobbett replied that no one would take a footman if honesty were his only qualification, and put this question, "Shall that be the only qualification for a Prime Minister?" No one can say that physicians or surgeons do not desire and do not strive to be Fellows of their respective colleges, or that both are not better for having learned the necessary elements of their profession. The only objection to a proper examination of Fellows is that it is absurd to expect it from men of thirty years of age who have been seven years in practice. The physicians and surgeons saw the force of this, and though the examination may take place at twenty-one years of age, the title cannot be assumed until they are twenty-five. The Fellow's examination should only be more complete than that of the Associate's; and the candidate should have a certificate of having acted as a clerk of the works for a year, and made out the necessary full-sized diagrams for the work on the floor.

I have only one remark to make before I give my peroration. I am rather surprised that architects do not see that degrees of excellence are possible in architecture; or, if they do see it, that they do not act on their convictions. The greatest living architects are contented with the same remuneration for their work as the apprentice just out of his time, and merely seek to get into a wholesale business. This greatly helps to degrade the profession in the eyes of the public, and gives a very wrong impression of the facts, as every architect well knows. Thousands of public monuments have been erected in Europe since the Golden Age of Greece, not to speak of important private buildings; yet the Parthenon and the Caryatid Temple on the Erechtheion have never been equalled since, nor the interior of the Pantheon, nor the west front of Notre Dame at Paris, nor the Cornaro-Spinelli Palace, nor the Scuola di San Marco, nor the town hall of Brescia.

In all the other fine arts the first successful effort brings its author next to nothing, but those produced in the height of his skill and knowledge mostly bring him wealth, if that be his desire. The great Diogenes was a beggar, and Jean François Millet, the one artist in Europe according to the Japanese, was in poverty; and so was Alfred Stevens. Every architect knows that in the case of architectural works of moderate size it is a question if he is to gain or lose a five-pound note; and the more care he takes, the more certainly is the balance on the wrong side. The fashionable architect with 100 buildings has a difficulty in persuading the profession or the public that he bestows the same loving care on each of his 100 buildings that he would do if he had only two, and is apt to provoke the retort of the lioness to the beasts in *Æsop's Fables*. "There was a great stir made among all the beasts which could boast of the largest family. So they came to the lioness. 'And how many,' said they, 'do you have at a birth?' 'One,' said she grimly; 'but that one is a lion.'"

I cannot help desiring to see the pursuit of architecture followed on sound principles, nor can I forget the absence of any system in my youth; for then after you had drawn out examples of the Greek and Roman orders, genius was supposed to do the rest. I am delighted at the admiration of our smaller Domestic architecture by our great morning newspaper, the *Times*, and by M. Paul Sédille in his "*L'Architecture Moderne en Angleterre*"; but I wish to see that admiration extended to our great public buildings as well.

One sees to what lengths a proper architectural education may lead from mere savagery in the architectural triumphs of the Middle Ages. If the true architectural high road could be again found all might hasten to the goal, and not be like the dragon's teeth when the stones were thrown into the middle of them. Who knows but that in the case of the right road being found the public might not again take a passionate interest in the excellence of our art, as it must have done at the great epochs? Modesty is a charming virtue in all, and especially in those of great intellectual endowments, but if this modesty is only to make us idle and worthless, let us throw it off. Let us no longer say we are so inferior to the ancient Greek, Roman,

Byzantine, Saracen, Mediæval and Renaissance architects that it is no use trying to equal them. Have we relinquished the courage, daring and self-reliance that once distinguished our race? If we have we must be contented to lag behind the rest of the world. If we are not equal to former races, and particularly to the Romans whom we so much resemble, I believe it is because we have got into a wrong road, and I would rather see architects take up the position of our ambassador at the Court of the father of Frederick the Great, than be ready to confess that the English are hopelessly inferior to the great architectural races. You may remember that Frederick William had a regiment of giants and paraded them in front of our ambassador, and asked him if he thought an equal number of Englishmen could beat them? The ambassador said he could not say that, but he would undertake that half the number would try. I hope we are not worse than the men of Milton's days, and hear what he says of them:—"Lords and commons of England! consider what nation it is whereof ye are, and whereof ye are the governors: a nation not slow and dull, but of a quick, ingenious and piercing spirit; acute to invent, subtle and sinewy to discourse, not beneath the reach of any point the highest that human capacity can soar to. Therefore the studies of learning in her deepest sciences have been so ancient and so eminent among us that writers of good antiquity and able judgment have been persuaded that even the school of Pythagoras and the Persian wisdom took beginning from the old philosophy of this island. And that wise and civil Roman, Julius Agricola, who governed once here for Cæsar, preferred the natural wits of Britain before the laboured studies of the French."

I firmly believe that the race has not degraded, and that if we will only again take up the right way of learning we shall astonish ourselves and the world. May I not say:—

Men, my brothers, men the workers, ever reaping something new;
That which they have done but earnest of the things that they
shall do?

To those who are not architects I may say that if you will devote yourselves solely to money making and feasting, architecture which mirrors the condition of nations at the time it is executed will certainly languish, for the admiration it should excite and the gratitude it should call forth is the very breath of its nostrils. It cannot, however, be said of the nation now that it is without aspirations, for there never was a time when so many were striving to penetrate the secrets of nature and the past acts and thoughts of man, and trying to yoke the power of nature for man's use, and to teach and elevate their fellow-man and his helpmeet. To women more liberty has been granted than Mary Wollstonecraft asked for, and they have achieved even more than she hoped for. But all these studies and pursuits rather throw our contemporaries off those primary delights that nature gave to raise, to solace, and to purify mankind—I mean the beauties of form and colour and the impressiveness of light and shade. But if these lessons be neglected, we shall leave behind us but a poor account of ourselves in those arts which strike the eye and impress the imagination. We have too unfortunately abandoned the symbolic, the emblematic, and the allegorical, so that we can tell no story to the eye by which the multitude may be impressed. It is foolishly believed that a paragraph in a newspaper or in an Act of Parliament will tell the same story and make the same impression on the multitude that can be made by a fine building adorned with storied and allegorical sculpture and painting such as we see in the Arch of Titus or Severus. The Jubilee procession, poor as it was compared with Mantegna's "*Triumph of Julius Cæsar*," told more of our power and extent of empire to the populace than all the history that has been written in this century. Recollect what an obtrusive art architecture is, and how strongly it forces itself on the attention; how long it lasts, and how it forces people to come to see it in its own country. If you would only think that it is the history of the present power and cultivation of the people, you would at least learn enough about architecture to be able to judge of its excellence as you do about the other fine arts you love, and be as proud of its excellence and as delighted with it as you are with the pictures, statues, poetry, romances, and musical compositions of the day, and when you do take the same interest in it you will certainly have your reward.

A vote of thanks to the President, proposed by Mr. H. H. Statham, was seconded by Dr. A. S. Murray.

Mr. A. S. Flower will read a paper at the next meeting on November 15 entitled, "*Notes on Renaissance Architecture in Malta, with special reference to the Buildings of the Order of St. John.*"

The New General Hospital which has been erected at Kettering at a cost of 10,000*l.*, on a site given by the Duke of Buccleuch, was opened recently by the Right Hon. R. C. Spencer.

NOTES AND COMMENTS.

THERE is at last a chance that the ruins of the Cour des Comptes on the Quai d'Orsay in Paris will no longer remain as a memorial of the Commune. Various schemes for dealing with them were proposed during the past quarter of a century, and at one time it was arranged to convert the ruins into an imitation of the South Kensington Museum. But utilitarianism has finally gained the prize from decorative art. The Chambre has agreed to a proposition for the concession of the block to the Compagnie d'Orleans, in order to erect on the site a terminus which will be more central than the present building on the Boulevard Montparnasse. The interests of the International Exhibition of 1900 must have had an effect on the voting, for some years ago a railway terminus in such a position would not be tolerated. But Paris, like London, must submit to the locomotive.

THERE is sometimes danger in approaching or returning from Mont St. Michel, but our readers will say that enhances the interest of the place, and establishes it in the memory. In the course of a few years the Mount will be less isolated, for it is proposed to construct a line of railway to it from Pontorson. Everyone who has seen the place will at once realise what a transformation will follow. There will be a railway station at the foot of the Mount, and the rampart will serve as a buffer. The dyke will no doubt be filled up, and other changes are sure to follow. A pilgrimage to the Mount will no longer be able to recall Mediæval days to the most imaginative mind, and although Americans, who would like to have an electric railway forming a circumference for the globe, will be satisfied, few architects will approve of an innovation which is vandalism on a big scale.

WE recently mentioned that an attempt to revive monopoly in the architectural work of the Birmingham City Council was defeated. The building which was to be the prize was a lunatic asylum at Holly Moor. The asylums committee have since invited the following local firms to send in competitive plans:—Messrs. MARTIN & CHAMBERLAIN, Messrs. COSSINS, PEACOCK & BEWLAY, Messrs. MANSELL & MANSELL, Mr. FRANK B. OSBORN, Messrs. CROSS, BROOKES & NICHOLS, and Messrs. INGALL & SON. Accompanying the invitation is an intimation that, instead of offering the usual premiums, the committee decided that each selected competitor should be awarded 100 guineas for the trouble of preparing the plans. The plans will be adjudicated upon by the committee, in consultation with the medical officers of the present asylum and the city surveyor. Contrary to the usual practice, the competitors are to sign their full names and addresses on the drawings.

THE principal librarian of the British Museum lately said that the trustees were most eager to obtain firemen from the London County Council, but the price demanded for the service was higher than could be paid. The trustees used to allow a gratuity to the superintendent of the Fire Brigade for occasionally inspecting the firemen belonging to the Museum, but the County Council considered it was not becoming that their officers should obtain pay from outsiders, and the arrangement was stopped. Commander WELLS, however, is allowed to make honorary visits. At the South Kensington Museum the Sappers are drilled as firemen, and if an occasion arose to test their services they would be sure to act efficiently. The Museum arrangement will have to become more general, for the London County Council have decided that they cannot spare London firemen to specially protect Government property, in view of the pressure which is frequently put upon the members of the brigade to deal with fires in the county of London. All their men have been withdrawn from the General Post Office and the India Stores. In accordance with previous arrangement, the duty of watching was at once taken over by a force comprised almost entirely of pensioned members of the Metropolitan Fire Brigade.

AN experiment lately attempted by the London School Board is worth attention elsewhere. It was decided to cleanse periodically the drains of such of the schools as have been brought up to modern requirements. According to the Board's sanitary surveyor the schools were divided into two districts (north and south), and two men in each commenced the work on January 4 last, since which date 289 schools have been visited, at an expenditure to end of July of 174*l.* 15*s.* 2*d.*, at 240 of which the drains, manholes and chambers have been thoroughly cleansed (cost 165*l.* 7*s.* 7½*d.*). A second visit has been paid to forty-nine of this number for the purpose of cleansing the manholes only (cost 9*l.* 7*s.* 7*d.*). There are still some ninety schools which have not yet been visited. The average time taken at the school where the whole of the drains, manholes, &c., are cleansed is two days. But this depends largely on the size of the school, the system of drainage and the means of access. When the manholes only are cleansed the average time has been one day. The sanitary surveyor considers that the present arrangement should be continued, as numerous stoppages have been cleared which would probably have become far more serious, necessitating orders to the local contractors, in some cases costing more than has been incurred in cleansing the drains. In addition to this, many caps to interceptors have been found missing and have had to be replaced, thereby avoiding complaints of smells. These caps are frequently removed by the pressure of sewer-gas, and if not noticed are washed through the interceptor into the sewer. It will be necessary to employ a couple of additional men.

ON Monday last Mr. HUGO MATEAR read a paper before the Liverpool Architectural Society on "The Birth and Development of Architecture." During the session the following papers will be read:—December 6, "The Domestic Architecture of the Renaissance, Elizabeth—James," by Mr. J. A. GOTCH; January 10, "The Architecture of MICHEL ANGELO," by Mr. BERESFORD PITE; January 24, "Brass and Copper Work," by R. LL. B. RATHBONE; February 7, "The Quality of Strength in Architecture," by Mr. W. H. BIDLAKE, M.A.; February 21, "Some Notes on St. George's Hall," by Mr. F. E. PEARCE EDWARDS; March 7, "Sienna and Baldassare Peruzzi," by Mr. FRANCIS W. BEDFORD; April 4, "A Description of the Royal Insurance Buildings," by Mr. JAMES F. DOYLE; May 2, closing address by the president, Mr. W. E. WILLINK, M.A.

PREMIATED DESIGN FOR THE HOTEL METROPOLE, MORECAMBE.

THE design illustrated was submitted by Messrs. H. & E. MARTEN of Bradford and Harrogate, under the motto "Pro bono publico." The stipulated cost was only 30,000*l.*; the authors, therefore, considered it was more prudent to build shops only towards Heysham Road, leaving to a future time the providing of houses over them. To extend the first floor of the hotel over the whole area of the shops as suggested in the instructions would only increase the cost of working and lose a large revenue from the houses over the shops in Sefton Road; there would also have to be corridors of interminable extent. The 150 bedrooms required are provided on the two principal fronts, with servants' rooms in the attic. The building as shown contains 1,430,410 cubic feet, which at 5*d.* per foot gives 29,800*l.* If houses over the shops in Heysham Road were provided the cost would be about 3,000*l.* in addition.

ECCLESIOLOGIA GERMANICA.

By T. FRANCIS BUMPUS.

(Continued from last week.)

THE Catholic Jacobi Kirche (church of St. James) at Goslar, of whose western façade the accompanying illustration will convey a good idea, although more humbly dimensioned and poorer architecturally than the building just touched upon, will delight the admirer of picturesque interiors, containing as it does a considerable amount of eighteenth-century fittings. The nave is Transition between Romanesque and Pointed; the aisles, which are of the same height—thereby constituting the Jacobi Kirche a building of the "hall" class—are very late and inferior. Their windows have been gutted of whatever mullions and tracery they may have possessed, but some tolerable Late Gothic mouldings can be seen outside at the bases of their jambs, as well as some good foliated ornament in the caps of the shafts attached to the piers whence the groining ribs spring. Among the fittings, sundry bench ends and the pulpit are certainly most beautiful; they are typical neo-Gothic German work, and deserve a corner of the sketch-book. On the panels of the overhanging western organ

exceedingly picturesque, but they did not appear to advantage on the occasion of my visit, my ecclesiological researches in Goslar being, as I hinted above, prosecuted under the disadvantages of soaking rain and enervating mist concealing the tops of the Harz Mountains under which the town nestles. The latter disagreeable element did not, however, prevent the façades of its churches from standing out against the hills with a startlingly weird effect, which haunted me all the way to Halberstadt. The spires of this long-looked-forward to city, crowning the gentle eminence up which the town so picturesquely clammers, were—Chartres-like—visible long before the train, bound for Halle, had scoured across the rain-sodden, cheerless-looking plain and had steamed into the railway station, where it deposited me at half-past six to the minute.

In the courtyard of the station I was unfeignedly glad to see two omnibuses drawn up—glad, I say, because occasionally on arrival at a German town this economical vehicle has failed to put in an appearance. One of the buses appertained to the Hotel Goldenes Ross (Golden Horse), the other to the Weisses Ross (White Horse). Availing myself of the services of the vehicle that hailed from the establishment rejoicing in the appellation of the second named quadruped, I was shut in, the thing thundered off like a fire-engine at full gallop, and in less than no time deposited me at the door of a hostel to which, for homely comfort, I should never hesitate to direct any one visiting Halberstadt. It stands in a species of boulevard to the east of the old town, and from the windows lighting that "region of the drowsy god" to which I was ushered, the three great churches—St. Martin's, the Dom and the Liebfrau Kirche—placed as they are in an almost direct line with each other—presented the effect of one enormously long church equipped with eight steeples. The evening being too wet to pursue any ecclesiological researches, I spent it very pleasantly *en famille* with the "good people of the house," whose pride and delight at the installation of an Englishman in the establishment knew no bounds.

Halberstadt.

If the steeples of Halberstadt had worn an imposing aspect as they loomed through the mist of the previous evening, they looked doubly fascinating when, at six o'clock on the ensuing morning, the sun, shining out of a pure blue sky, was bathing their eastern sides in a flood of golden light.

Knowing by experience how treacherous such brilliant early mornings frequently are, I deemed it prudent to be out and among the architectural treasures of Halberstadt without loss of time. None of those *contretemps*, those little annoyances that so frequently occur just when you are anxious to be out sight seeing, such as the sudden dissolution of partnership between the shirt-collar and its button, or the slipping for the twentieth time from your hand of the soap, which, instigated thereto by a demon of more than ordinary impishness, alights (as a fit *combe* to the proceedings) upon the shoe, which the deft *Hausknecht*, Ludwig or Alphonsus or Heinrich—it is sure to be one or the other—has just succeeded in polishing to a mirror-like brilliancy—no such *contretemps*, I say, having occurred to mar the solemnities attendant upon sacrificing to the Graces, I was soon threading the picturesque streets in the lower part of this most delightful of old German cities. The Dominican church—a typical structure of the class that Order were so careful to raise in the midst of all the great towns—

Bernardus Valles, Montes Benedictus amabat;
Oppida Franciscus, celebres Ignatius urbes,

first challenged attention. Although an unclerestoried church, consisting of a nave with aisles and an apsidal choir without those appendages, all contained under one long line of roof broken only at the commencement of the choir by a light *flèche*, the external elevation of this Dominican church at Halberstadt is far more pleasing than that of other buildings of the "hall" class in Westphalia, owing in a great measure to its less exaggerated height and to the choir, which is much more elongated than in the same kind of church when purely parochial. The nave is lighted by five tall Late Decorated windows; the choir is of four bays, and the apse, where the work is decidedly superior to that in the rest of the church, is a three-sided one and very graceful. Some of the windows exhibit a curious fusion of plate and bar tracery, others are round-headed ones of three pointed lights having tracery composed of foliated circles. The central window of the apse is blocked

WEST FRONT OF ST. JAMES'S CHURCH, GOSLAR.

gallery are some eighteenth-century paintings, more curious than beautiful, of the Nativity and angels bearing various instruments of music. The eastern windows of the apse are completely obscured by an immense altar-piece in the "sprawling" style of the last century, which one would sacrifice without the least compunction. The font of 1592 with cover and railing is good, but the gems of the church are the two windows lighting the side walls of the chancel. They are of a type not often met with in Germany, *i.e.* the plate traceried. Each window is of two unfoliated lancet lights, the head being pierced with a quatrefoil.* The surroundings of this church are

* Another German example of plate-traceried fenestration occurs in the Westphalian church of Ober Marsburg. There is a Romanesque one at Dobrilugk in Saxony.

presumably by one of those gigantic Italian altarpieces—presumably, I say, for although this church and the similarly planned one of the Franciscans at the opposite extremity of the town are still retained by the Catholics, I was surprised to find the doors of both edifices hermetically sealed during the day. Indeed, I only gained admittance to the latter by somebody who had chanced to leave the door ajar while ringing the six o'clock "Ave Maria." The day, too, of my visit to Halberstadt was the Vigil of the Assumption, when one would naturally expect to find churches of the Roman obedience thronged with devotees in attendance upon the Ministry of Reconciliation, preparatory to the Masses of the morrow, but apparently Catholicism is not strong here.

A few remarks on the interior of the Franciscan church will apply equally well to that of the Dominicans. As is usual in the churches of this class in Saxony, as at Gortitz and Halle, the nave is separated from the aisles by very tall octagonal pillars without capitals. The roof ribs partly die into them, and are partly carried by a small shaft attached to the nave side of each pier towards the summit.

The apsidal choir is a very graceful one of four bays; it has no aisles, and its tall, three-light windows have their mullions intercepted midway by a very odd feature, viz. an unfoliated circle filled with painted glass, the rest of the window being *en grisaille*. The windows in the apse of the Martini Kirche—a church to be noticed hereafter—present the same peculiarity.* A small *flèche*, marking the commencement of the choir, alone breaks the long line of roof, as at the Dominican church, and the western elevation shows the main gable prolonged over the aisles, the centre portion above the west door being pierced with a tall three-light window, having a slender two-light one on either side.

And now I must take my readers with me to the Dom, perhaps next to that of Cologne the most satisfactory clerestoried cruciform church Germany can show—interesting, too, as having such cathedralic entourages as cloisters and chapter-house in a good state of preservation.

The history of this great church at Halberstadt is so interesting that a brief sketch must be given of it before considering it architecturally. The first care of Charlemagne, after his subjection of the Saxons, was to convert them to Christianity and instruct them in the Christian doctrine. The latter part of the eighth century therefore witnessed the establishment of the North German Sees of Paderborn, Bremen, Osnabrück, Minden and Münster. Of these bishoprics Bremen, Paderborn and Minden were for the Angvicar Saxons; Münster and Osnabrück for the Northern Westphalians, while the Westphalians of the south were placed under Cologne. For the Eastphalians Charlemagne erected the bishoprics of Werden and Hildesheim, and while the ninth century was in its teens the See of Halberstadt was founded, and its boundaries settled, for the Saxons of Thuringia.

Towards the close of the sixteenth century the long line of Halberstadt's bishops ceased, the city being among those that embraced the principles of the Reformation. The See was one of that large number subject to Mayence, its co-suffragans being Augsburg, Bamberg, Chur, Constance, Eichstadt, Hildesheim, Paderborn, Speyer, Strasburg, Verden, Worms and Würzburg. The Bishop of Halberstadt occupied a place in the Tenth Circle of the Estates General—the Circle of Lower Saxony—which included the Archbishops of Magdeburg and Bremen, the Bishops of Hildesheim, Lübeck, Schwerin, Ratzeburg and Schleswig, the Dukes of Holstein, Brunswick, Saxon Lauenburg and Mecklenburg, and the cities of Lübeck, Hamburg, Göttingen, Goslar, Nordhausen, Muhlhausen, Wismar, Rostock, Stralsund, Brunswick, Magdeburg, Lemgo, Erfurt and Limburg, each of which names is sufficient to conjure up visions of the greatest delight to the lover of architectural art and antiquities, with the study of which their historical associations are indissolubly bound up.

The present noble Gothic cathedral of Halberstadt occupies the site of several earlier ones.

The first Bishop of Halberstadt, Hildegryn I., commenced the original cathedral, which was consecrated on the day after the Octave of All Saints, November 9, 859, by Hildegryn II., and dedicated to St. Stephen. In 967 a grander building was commenced by the then occupant of the See, Bernard, by whom many relics of saints were brought from Rome to his cathedral. Hildeward, the next Bishop of Halberstadt, prosecuted the works inaugurated by his predecessor with so much vigour that on October 21, 991, he was enabled to consecrate the cathedral with great pomp and solemnity, in the presence of the Emperor Otho III. and of a great assemblage of nobles, among whom were four archbishops and eight bishops. What these cathedrals were like we have no means of knowing, for all vestiges of ecclesiastical buildings of this age have long since perished. Of the many magnificent basilicas raised in Northern Europe during the

Carlovingian, and immediately subsequent, eras it is sufficiently well known that hardly one remains, and in general all the Christian edifices which have come down to us from any high antiquity have been so overlaid with modern dress, so disguised, modified and mutilated by succeeding ages, as to be scarcely recognisable. This church continued till 1060, when fire, that enemy of Mediæval buildings, destroyed it; but its reconstruction was speedily undertaken by the reigning prelate, Burchard II., and with so much zeal that in ten years it stood completed, and again a splendid consecration took place amid much regal and prelatical splendour, the emperor Henry IV. being then on the throne. Sufficient data are not forthcoming to inform us of what character the eleventh-century church partook, but it is not unreasonable to suppose that it resembled such local contemporary churches as Hildesheim, Gernrode and Hecklingen, affecting, like them, a southern type of Romanesque. In its turn this cathedral fell a prey to the flames, for Henry the Lion, Duke of Brunswick, and founder of the existing solemn Romanesque church of St. Blasius there, pillaged Halberstadt in 1179, in retaliation for the insolence with which its bishop, Ulrich, as well as those of Cologne, Magdeburg and Münster, had opposed him during his war with the Emperor Frederic Barbarossa, and burnt the cathedral with 1,000 people in it, as well as a large part of the other churches in the city. Slowly Halberstadt rose from its ruins, twenty years elapsing before the chief portions of the cathedral were ready for the Divine offices once more. Early in the thirteenth century (1201-09) Bishop Conrad undertook great re-edifications, and in 1220, under his successor Frederic II., it was reconsecrated in the presence of the Bishops of Hildesheim, Minden, Havelberg and Culm. It is to this epoch that we may assign the glorious western front, with its portal or Paradise, and which, as a specimen of German First Pointed work, derives great interest not only on account of its excellence, but as an almost unique example of Early Pointed architecture on so grand a scale in this country. Johann Semika, provost of the chapter about the year 1236, began to rebuild the nave aisles, but did not proceed any further than the first three bays which, separated from each other by niched buttresses, are lighted by three-light windows in the Geometrical style; they are extremely beautiful, vying in purity with some of the best English work. To Semika was due the paving of the church with red and black tiles, some portions of which were discovered in 1847, 4 feet below the present pavement. During the thirteenth and two succeeding centuries the rebuilding of the cathedral on its present magnificent scale proceeded with great vigour, and under the auspices of various bishops, notably Ludolph II., 1257-85; De Volrad, 1285-95; D'Albert I. and D'Albert II., 1308-58, and of Burchard II., 1437-58. The church, much as we see it now, was essentially completed in 1491, and consecrated on the Feast of the Decollation of St. John Baptist, August 28 of that year. The year 1514 witnessed the completion of the chapter-house, and at last the buildings stood finished in 1574. But a change was at hand, for Frederic III., who occupied the See 1550-53, and Henri Jules, Prince of Brunswick, who presided over it 1566-1613, favoured the Reformation. The offices of the Catholic Church were said for the last time in Halberstadt Cathedral July 6, 1591, and except for a short time when the city was occupied by the troops of Wallenstein, during the Thirty Years' War, Protestantism has held sway here. But through it all this noble building has managed to preserve its ancient furniture and arrangements almost unscathed. The glorious Late Gothic rood-loft or Lettner, from which the Christ seems to look down with sad and wondering eyes upon the desolation around, still encloses the richly stilled and tapestried choir; the red marble font, which forms so conspicuous an object in the foreground of the illustration accompanying the first instalment of these papers, still retains its position; a fine corona of wrought-iron hangs in the nave; while a sixteenth-century bronze eagle lectern, and a considerable quantity of painted-glass, to say nothing of the treasures enshrined here in the shape of ecclesiastical orfèverie and needlework, all of which, having lost their religious significance, are carefully preserved and looked upon as curiosities merely by the sect into whose hands they have passed. Mournfully did the footsteps of the custodian and myself resound in the magnificent but sadly-deserted pile, as object after object was inspected during a long morning's visit. "Ichabod" is written everywhere; coldness, and the want of vital religion is felt as much as in the other great Lutheranised piles—Magdeburg, Lübeck, Naumburg and Brunswick.

It is, however, due to its custodians to say that elaborate and costly restorations have been in progress at Halberstadt Cathedral for many years past. Quite lately that of the lovely western façade has been taken in hand, and the towers which whilom were extremely insignificant ones, surmounted by simple broach spires of the local type, have been greatly elongated and terminated by gables from which spring metal spires, founded, I opine, on those glorious ones which lift themselves like lilies above the housetops of Lübeck and Lüneburg, and whose

* Reference to the illustration of this church in last week's issue will give the reader an idea of this.

SOUTH-EAST VIEW OF THE CATHEDRAL AT HALBERSTADT. (From a Photograph in possession of the Author.)

germs may be traced in that Westphalian group so proudly headed by St. Patroclus at Soest.

The chief feature in the plan of the Dom at Halberstadt is narrowness. The transepts project but one bay beyond the aisles, which are themselves destitute of those accretions so common to the great French churches—chapels thrown out between the buttresses; indeed, such additions to the ground plan never seem to have found favour in Germany, as with ourselves. It will be observed, on referring to the view of the church which accompanies this number, that the southern nave aisle is of unusual width; this is accounted for by the Treasury which has been built on to that side of the church for the accommodation of those precious relics of ecclesiastical antiquity of which mention has been more than once made in the course of these notes.

The restorations now in progress at the west end of the building precluded my gaining a very correct idea of its magnificence, but sundry peeps through the hoarding, which inexorably shut it out from the public gaze, showed me that the great portal was composed of two smaller cusped entrances contained beneath a great arch, nobly moulded and rising from clusters of banded shafts. In the tympanum, six plate-traceried lancet windows are pierced, receding of course in height, and in lieu of sculpture. Then comes a rose window, also plate-traceried, enclosed within an arch composed of a series of wavy lines like the corbel-tables of Romanesque work and springing from small belted nook shafts. In the next stage is a triplet of windows of three lights apiece, similar in arrangement to those seen in the view of the steeple in its penultimate stage, and apparently copied from those in the cloisters. The arches of the side portals appear never to have been completed. Their noble clusters of shafts have always been in position, and it is hoped that the rest of the work will soon have become an accomplished fact, enabling this western façade at Halberstadt to form the most imposing and at the same time purest piece of Early Pointed work in Germany. I have said that the first three bays of the nave on the north side are of the best Early Middle Pointed character (c. 1236); the next are later and not quite so good; but deterioration in workmanship is most apparent in the clerestory. It is thin, almost to flimsiness, though the flying buttresses serve in some degree to redeem it from this reproach. But the northern transept façade is very fine nervous Middle Pointed work, with just a *souçon* of the Flamboyant.

The Pointed portal encloses two smaller ones with square heads, the tympanum being filled with a sculptured group representing the Death of the Virgin. This doorway is surmounted by a wall space, unfenestrated, but relieved by a richly crocketed rood, from which The Figure, as well as those of St. Mary and St. John, has disappeared. Then comes a six-light window, whose tracery titubates between Geometrical and Flowing, and a richly panelled gable crowned by a finial. From this point the church presents a most imposing *ensemble*, especially since the completion of the western towers, recalling in some features the Lübeck churches; but the detail is far superior.

The greatest blemish on the otherwise fine plan of this church is the architect's arrangement of his eastern termination.

Instead of introducing that cluster of chapels which gives such a charm and grace to numberless French choirs, or that elongation of the side aisles to gain a procession path, which English architects knew how to use so gracefully, and which gives such effects of light and shade to the outlines of Chichester, Hereford, Salisbury and Wells, the planner of the Dom at Halberstadt has made the walls of his choir aisles stop exactly where the apse commences, and then, to connect them with those of the solitary eastern lady chapel, has introduced one elongated piece of walling lighted by a broad window of six divisions.*

Far better would the east end have looked had the architect terminated his aisles either, as in the English examples quoted above, or in a three-sided apse, if prejudice against the corona of chapels with their non-practicability of orientation was so strong. But perhaps some prescience of the Reformation dictated the adoption of such an arrangement. Who knows? Anyhow, it is far from being graceful or pleasing to English eyes.

(To be continued.)

Mr. Frederick Earp, who at one time was well known for his paintings of Sussex scenery, has died rather suddenly in Brighton.

* The church of St. Alban, at Teddington, which—from the pencil of Mr. Niven—must undoubtedly be considered the finest structure of its kind that has been raised of late years within a twelve-mile radius of town, exhibits the same arrangement of the circumambient aisle. There is a *souçon* of German about the whole building, but this is a particularly marked one. The lady chapel is, however, wanting here. Of course I may be mistaken as to the nationality of this church's *ensemble*, but the impression it left on my mind was decidedly a Teutonic one.

FORGERIES AT SOUTH KENSINGTON.

THE increase in the number of connoisseurs has led, among other effects, to a more exact scrutiny of the contents of museums and picture galleries. Works which formerly were admired are regarded with suspicion. It is now, for example, doubted whether any museum in Europe possesses a genuine work by Benvenuto Cellini. "Lermolieff's" observations have not only created misgivings about the Italian works in Munich, Dresden and Berlin, but about those in other galleries. As for the recent additions to the Louvre collections, they are accepted as excellent subjects for the exercise of French wit.

Visitors to the South Kensington Museum were aware that from time to time objects were withdrawn from exhibition or, if retained, were presented to notice under new labels. During Dr. Middleton's reign as art director a considerable number of forgeries were removed from the cases in the Museum. It was anticipated, therefore, that in the course of the recent inquiry by the select committee appointed to report on the administration and cost of the South Kensington and other museums of the Science and Art Department, there would be many revelations about the fallibility of the officers and advisers by whom purchases of objects were effected. It cannot be said that the subject was exhausted, for in many cases only suggestions of fraud were given, but some of them are remarkable. They bear out the assertion of Sir J. C. Robinson:—"When I retired from office a period of decadence and confusion ensued, and for years the conduct of the institution, especially as regards the nature of the acquisitions currently made, sunk lower and lower, until the state of the Museum became a by-word of reproach to all persons of real understanding in art."

One of the first cases mentioned suggests that a man so able as the late Sir Digby Wyatt can be mistaken, or it would be correct to say his opinion is not accepted by later experts. In 1870 a Dutch clock, which was said to have belonged to the King of Hanover, was offered to the Museum for 1,250*l*. The opinion of Sir Digby Wyatt was sought, and he sent the following report:—

"Although this object, which is of the very utmost importance as a piece of silversmith's work, bears the signature of a Dutch horologist, I cannot but believe it to be Genoese work, for the most part at least. I think this, not from the filigree work, because the Dutch were (and still are) excellent workers in filigree, but from the admirable design and execution both of the figures and ornaments." This is unquestionably the finest object which has come under my observation for a long time as procurable for the Department's Museum, and I do not hesitate to warmly advise the purchase; of course, if this object can be purchased for less than 1,250*l*., so much the better, but even at that price I do not consider it at all dear. There is nothing improbable in the union of Dutch and Genoese work in the same object, for the Genoese merchants were in constant relations with those of Amsterdam and with the Spaniards in Flanders, whom they were constantly supplying with works of art. There are (if I remember rightly) in the Doria Palace at Genoa a set of silver vessels of great celebrity and value, and I cannot but fancy that I recognise the same hand in the repoussage of those vases and this clock. The vases have been attributed to Cellini, but I have always believed them, as I do this, to be of the finest old Genoese work."

The purchase was also advocated by Mr. Redgrave, R.A., and 1,250*l*. was paid. It is now found that the clock was offered for sale at Christie's in the preceding year, and was "bought in" by the owner for 350*l*. Several examples of Della Robbia which were bought for large sums as originals appear now in the Bethnal Green Museum, which is a refuge for costly shams, as "imitations" of the ware. For a chair which was described as Cardinal Wolsey's 72*l*. was paid, as to the Museum experts it was Tudor in style, but when Mr. Purdon Clarke explained that it was Cingalese and made in the last century for the Government House in Ceylon the label was altered. An ancient French cabinet with marqueterie panels was bought for 816*l*. The man who made up the treasure is still living, and is now employed as a "repairer" in the Museum. The circumstances under which another strange work, the Molinari Gateway, was acquired are described by Mr. Thomas Armstrong as follows:—

"I saw it set up against the wall of the large space in front of Santa Maria delle Grazie at Milan, and was very much struck with it. I heard about it in the town, and saw the owner, and for some time we were negotiating with him for the purchase. The owner was a certain Molinari of Cremona, who was an innkeeper and dealer in works of art. I had heard from other sources where it had come from. Molinari told me he knew an architect, who was very clever indeed, then dead, who had studied very closely the façade of the church of the Miracoli in Brescia, of which this work is supposed to be an imitation; that he was a man of great genius, and that he had arranged or adapted this thing, and that there was a great deal that was new in it. I may say that Molinari was very old then, and that

this had happened long before, and the gateway had been lying where he had sold or tried to sell pictures close to the church there. He did not disguise the fact that many portions of it were new. We bargained about it, and bought it for 602*l*. I afterwards saw a man who said he had made the whole of it. I believe he qualified that statement afterwards, and pointed out the few pieces which he said were ancient. I may tell the committee, however, that this gateway is about 20 feet wide and 25 feet high and weighs tons, and that it is hardly natural or likely that any person would on speculation make a thing of this kind, which could not be bought by any private person except some monarch or prince who was building a very magnificent palace, and could hardly be admitted into any museum except ours. This carver is a very clever man; I do not think I need advertise him by giving his name, but he is a most skilful carver, and he has probably done certain parts of the work. It is very difficult to tell which are the parts. All the parts which he claims certainly were not done by him, and I may also point out that if the restoration had been on anything like the scale claimed by this carver, he might have restored the cornice, which is very important—so important that I have often thought myself that I should like to have to put up a piece of it restored to show what it was like when complete."

From the evidence of Sir J. C. Robinson the doorway is mainly a modern work. The following account of it by him is a further revelation of an industry which has existed for more than a century in Italy, and of which Englishmen are the chief patrons or victims:—

"In respect to this doorway, then, I beg leave to state that the year before Mr. Armstrong purchased it at Milan it had been offered for sale to the Museum and refused, and both he and Sir John Donnelly ought to have known that the correspondence and my report on the doorway were in the registry of the Department. Although Molinari, the Milan dealer, began by asking 1,000*l*. for the doorway, it was understood that it might at that time have been obtained for about 300*l*., for it had already been found to be quite unsaleable. Mr. Armstrong, however, paid 600*l*. for it, and I should think the expense of transmission to England and its re-erection at South Kensington must have brought the entire cost up to about 1,000*l*.; but the doorway would have been dear at any price, inasmuch as it is an overt fraud, such, indeed, as no person having even the most rudimentary knowledge of Italian fifteenth-century sculpture could have failed to perceive. The doorway is, in fact, a spurious modern 'make-up' by an ornamental sculptor who was living at Brescia, one Pietro Faitini, well known for his imitations of Italian Renaissance sculpture. I have here a letter from this man showing the exact state of the case. This letter is in the Italian language, and perhaps I had better read a translation:—'Brescia: December 28, 1885.—I, the undersigned, declare that the doorway sold by Mr. Molinari, of Cremona, to an English gentleman, of London, was acquired at Ghedi, in the province of Brescia, and was the property of Mr. Bondella. The said doorway was in the old feudal castle of the Counts of Pitilono. The ancient ornamental parts were the basements, which consist of trophies, the two impostes of the arch and two capitals; all the rest of the doorway is my work except six medallions. In confirmation, believe me, PIETRO FAITINI.' I may say that I have verified the exact truthfulness of this account, and that I am quite ready to point out all the details in question in presence of the work itself. Faitini, or his employer, Molinari, got possession of some mutilated portions only of an original sculptured doorway from a ruined castle in the mountains near Brescia. The fragments were made use of in the composition of a new doorway of very different design from the prototype—that is, by the addition of new details on a larger scale invented by Faitini; but this is not all; other details of ancient origin, but taken from entirely different sources and of different dates and discordant styles, some of them as late as the end of the seventeenth century, were got together and mixed up with the new work. In short, I believe, as it stands, at least three-fourths of the structure is modern, and a further portion of fragmentary and discordant ancient work. I consider this doorway an imposition on the public, and that it ought forthwith to be dismantled and removed from the Museum."

It is now difficult to determine whether a bust of Savonarola was bought as an example of Renaissance sculpture or as a modern work, but it was sold as ancient. Mr. Armstrong gives the following explanation of the transaction:—

"The bust of Savonarola was made later than that of Benevieni which was bought by the Louvre. I cannot remember the circumstances in which it was first seen by Costa and Banti, two distinguished artists; but they saw the bust and were very much taken by it. They considered it an old work; it looks like an old work and they bought it for what was then a large price, especially for two people who were not rich; they joined in buying it for 10,000 lire, or 400*l*. I dare say many of you know what a great commotion was made about it at the time, how it was exhibited at San Marco and the proceeds

given to a charity, and how everyone was talking about it. I remember Sir Frederic Leighton asked for leave to draw it and did go to San Marco to make a drawing of it. After that there were whisperings, as there had been about the Benevieni bust. The Benevieni bust was bought by the Louvre and there was a great commotion about it, because reports came from Italy, from Castellani, I believe, that it was false; this was disputed for a long time and it was only proved by Bastianini bringing forward the man from whom he had done it. They said it was quite impossible and that it was obvious that a bust of that kind, so lifelike, with this extraordinary character of vivacity, could not have been copied from anything; but it turned out that Bastianini had seen a man in the street who was very much like the portraits of Benevieni, and he had made this bust, working from nature. That was the way in which the Savonarola bust was done too; he got a certain quality of vivacity in it by working from the living model which could not have been got in the way of an ordinary forgery. It was the property of Costa and Banti, who had it year and year about; they used to take turns of having it in their houses, and it came on loan to the South Kensington Museum some years ago as a very interesting specimen of a class of sculpture which is very rare now, and afterwards it was bought on the recommendation, I think, of Sir Frederic Leighton, Mr. Tadema and Mr. Poynter; I do not know if there were any others. It was, of course, bought as a modern work and never since I have known it was it looked upon as anything else. Bastianini admitted he had done it."

Mr. Armstrong, in consequence of the deceptions, is rather despondent about the contest between experts and forgers. "Modern work," he says, "can be so disguised that you cannot detect it. I believe that people like Bastianini and Mariani of Perugia have made things which have been accepted in most of the museums of Europe, and that although there may be differences of opinion, no one can say for certain that they are modern things." Mr. Armstrong mentions a case of a very beautiful ivory lectern or reading desk which was offered for sale to the Museum and declined because it was supposed to be false. Some of the greatest authorities pronounced it to be a forgery, and yet a man who, in his own opinion, is the greatest judge in England has purchased it. In the case of the Savonarola bust there was more than one quality to tempt the unwary, for it suggested how sculpture was sometimes coloured:—

"It is in every sense an original work," said Mr. Armstrong; "it is full of the most extraordinary vivacity; it has great qualities as a work of art which would distinguish it anywhere, quite apart from the fact of its being an imitation of an old style or work. The manner of its execution is imitated from the old work. I think I have already related how that came about. There are certain things about that bust and about the Benevieni, which was bought for the Louvre, which convince artists or people who take any interest in works of art that it was modelled from nature. Anyone will see at a glance that there is an extraordinary vivacity about it; a lifelike appearance, which is a very high quality in art. This convinced artists at the time that it could not be merely a copy of an old bust or of some old work. No artist could put that kind of life into a copy, and, in the first instance, it was found out how this was done through the Benevieni bust which was bought for the Louvre. People refused to believe that Bastianini had done it; they said it was quite impossible. When Bastianini confessed he said he knew the existing portraits of Benevieni very well, and he told how he had met in the streets a workman who was strangely like these old portraits, and he set to work and modelled the bust from this man, making it sufficiently like him; he gave it a lifelike quality from the living model, and a sufficient likeness to the known portraits of Benevieni; he so skilfully manipulated the surface of the terra-cotta that the effect of time on the tempera paint is most skilfully and wonderfully rendered. The paint has been removed from the Benevieni bust, but it remains on the Savonarola bust, and on that account I think ours is much more valuable. The tempera painting in imitation of old painting remains, and the bust is a very extraordinary instance, not only of really admirable artistic quality in modelling a bust from life, but also of the method of colouring sculpture, which is very much in vogue now, and of which we have very few good specimens."

Another case deserves to be made known, for, by the irony of fate, it relates to Palissy ware, which was the creation of one of the most honest of potters. Sir J. Donnelly said that among a collection purchased in 1879-80 from Sir J. C. Robinson, the art referee, was a plate which was supposed to be Palissy ware. It appears that "one of the Museum keepers, thinking he had seen something of the same kind elsewhere, examined it carefully, and took off the seal and a piece of linen that had been fixed on the back over some breakage, and he found that there was the name of a modern French pottery manufacturer in Paris of the name of Pull. Sir Charles Robinson's attention was called to this, and he offered to repay 50*l*. if the plate was destroyed or given back to him; and it was given back to him."

Now Sir J. C. Robinson, with reason, demurs to a part of the evidence relating to the plate, and gives a circumstantial account of the affair. He was not art referee when the plate was purchased from him, and instead of offering to refund 50*l.* he actually paid it back.

Sir J. C. Robinson further says :—

"This is the only instance amongst the thousands of works of art purchased by me for the nation to which, so far as I am aware, any objection as to authenticity has ever been made. I have never yet heard of any other case but this one. This one, I think, so far from throwing any discredit, has the opposite effect. I wrote this to Colonel Donnelly :—'10 York Place, Portman Square, April 4, 1897. To Colonel Donnelly. Sir,—I have carefully inspected the plateau referred to in your letter of March 28, and I find that it is not a genuine specimen of Palissy ware, but a modern facsimile example moulded from an ancient pewter dish, which also served as the basis of Palissy's work (see details appended further on). In other words, both are plastic reproductions from a common original type in metal. This modern reproduction, having fallen into the hands of some fraudulent dealer or fabricator of works of art, was with great ingenuity invested with simulated appearances of antiquity, rendering it most deceptive, and, indeed, practically undistinguishable from the ancient specimens of the same type by Bernard Palissy. It is scarcely necessary to say that, considering the ever-augmenting scientific, artistic and industrial resources at the service of the artistic and unscrupulous persons by whom forgeries of this kind are continually being produced, it has become almost impossible, even for the most learned and experienced connoisseurs and experts, to avoid being from time to time deceived. Whilst, therefore, I cannot but regret the occurrence of the present instance, I do not take to myself any blame in respect of it. At the same time, being deeply conscious of the great responsibility devolving upon every person undertaking to purvey or advise Her Majesty's Government in respect to the acquisition of works of art for our national collections, and considering the circumstances under which this specimen became the property of the South Kensington Museum, it will be a personal satisfaction to me to be allowed to make a pecuniary compensation for the necessary withdrawal of the specimen in question from the Museum. I desire, therefore, to be allowed to return to Her Majesty's Exchequer the sum of 50*l.*, on condition that the spurious plateau be returned to me or destroyed. I may now state that, notwithstanding the so to speak infinite number of acquisitions (certainly many thousands) which by procurance have, from its first foundation down to the present time, enriched the South Kensington Museum and also other public institutions, this is the first instance, to my knowledge, in which the authenticity of any such specimens has been brought in question.—I am, sir, your obedient servant,

(Signed) J. C. ROBINSON."

"Further memorandum on the spurious Palissy ware plate :—

"The original work by Bernard Palissy, of which the present specimen is an exact facsimile, is known as the Briot plateau. It was itself a copy, by the process of direct casting (sur-moulage) from a pewter plateau, ornamented with arabesques in relief, the work of François Briot, a French artist, who was one of the immediate predecessors and contemporaries of Palissy. Several original specimens, both of Briot's pewter dish and Palissy's enamelled earthenware reproduction of it are extant. The example in question, now discovered to have been made by M. Pull, a modern French potter, some time between 1860 and 1870, and, as is evidenced by the sharpness and perfection of the relief ornamentations, must undoubtedly have been moulded, like Palissy's previous reproductions, directly from one of the ancient Briot pewter dishes. At the same time the manufacturer, having apparently also become possessed of an authentic example of Palissy's reproduction in enamelled earthenware, was enabled to copy in the most minute and perfect manner the enamel glaze and colour from it. These operations being all of the simplest and most certain nature resulted in the production of examples practically identical with and undistinguishable from the ancient specimens of Palissy ware in all but the appearance produced by the accidents and inevitable wear and tear of centuries. It is probable that having produced a certain number of these facsimiles, the manufacturer's attention was called to the fact that they would inevitably fall into the hands of the makers and utterers of spurious works of art, and that therefore the easy process of simulating by artificial abrasion and other means, the required appearances of antiquity being superadded, would give them an inevitable vogue as most dangerous frauds; or it may perhaps have been the fact that M. Pull, having obtained the loan of the original plateau from some conscientious collector for the purpose of making his copy, the latter stipulated that the modern imitator should impress his name on some part of the work; in any case M. Pull seems to have stamped his name in minute characters on the body of the ware under the glaze, in the centre of the reverse of the plateau, on some, if not all of the specimens produced by him.

The specimen at South Kensington, which has proved to be one of M. Pull's plateaux, was in the first instance purposely broken in many pieces, though as by accident. It was then carefully put together again, strengthened at the back with a wire rim bedded in plaster of Paris; the surface of the piece had then been discoloured and rendered dull as if by the effects of time, and lastly an attempt had been made to efface the signature of M. Pull by abrasion, but this process not having entirely succeeded the place was covered by a linen band glued on as if to further strengthen the piece, and upon it, directly over the signature, was put a seal in red wax, purporting to be the mark of possession of some former owner of the piece, and it was only on removing the seal that the fraud was discovered. I think I ought now to say that the result of these fraudulent occurrences has been that all authentic Palissy ware has fallen in value, probably one-half or more. It is absolutely impossible to distinguish in many cases the fraudulent from the real specimens. In this case this fraudulent manipulation having been had recourse to, it was absolutely impossible to tell whether it was genuine or not. At that time when I purchased it I knew nothing about M. Pull having done these sort of things; no person could possibly have discovered or understood, and therefore there is no discredit whatever in being deceived in a case like that. It is quite another affair when a work of art which purports to be an original work and not a copy of something else, and in which there are discrepancies of style and date, deceives a man; then, of course, it is an inexcusable matter; but in this case it was not so. I may add further that when I was a member of the jury in Paris, I think in 1867, I had occasion to know M. Pull's imitations, but I had no idea that he had arrived at anything like the perfection of this example. It is understood it was moulded not from another plate, but from the original thing which Palissy's plate had been taken from, and therefore it was quite impossible to tell the difference."

We have said enough to serve as a warning to those who are ambitious to set up as collectors or as connoisseurs. "Antiques" are not always survivals of a past age, and no matter what enthusiasts may say, ancient art of all kinds can be imitated with a fidelity that will deceive the most knowing. As the late Lord Lytton wrote :—"A thoroughly competent connoisseur is one of the rarest things in the world; rarer, perhaps, than a great artist. And a connoisseur who is not only a competent judge but a competent purchaser, who thoroughly understands the marketable as well as the intrinsic value of such things, is still rarer. The sort of knowledge required in that capacity cannot be obtained from books. To possess it a man must have personally visited nearly every corner, or must personally have known nearly every dealer in Europe. And to such knowledge he must add a highly trained taste and judgment. If he possesses all these qualities, it is clear that by exercising them on his own behalf he can easily make, if he pleases, an income much larger than any salary which any Government could afford to pay him; and therefore, to secure his services, the Government should be able to offer him some inducement which to a man of refined feeling would be stronger than money."

Vendors of "antiques" were to be excused if they imagined that the militarism of the museums of the Science and Art Department facilitated the disposal of shams. How far they succeeded will never be revealed, but, as Sir J. C. Robinson says, "elimination" of many of the treasures is desirable. The forgeries may become an obstacle to the completion of the South Kensington Museum, for, as the same authority suggests it is wiser to ascertain what is worth preserving before any builders are called in, the committee are not unlikely to follow his advice in their recommendations.

A.A. LYRIC CLUB.

THIS season's opening concert of the A.A. Lyric Club (president, Mr. John Murray) was held on Friday last, October 29, at the Swallow Assembly Rooms, Piccadilly, when the president of the Architectural Association (Mr. Hampden W. Pratt) took the chair. There was an exceptionally large attendance of over 200 members and friends, among whom were several prominent members of the Architectural Association. During the evening a presidential hammer was handed by Mr. Hampden W. Pratt on behalf of the Club to Mr. John Murray, and several nominations were read. An excellent programme was carried out. Among the artists were Miss Jessie Hotine, Messrs. Theo. Disdin, Roland Henry, S. Constanduros, Gurney Russell, J. Berridge Fraser, Stanley Graham, W. Coward, F. H. Willis, Mark Ambient. Mr. C. D. Imhof was the accompanist.

Mr. Walter Hanstock, of Leeds and Batley, has been successful in the competition for the proposed dead market for Leeds which is to be erected on a site adjoining the Kirkgate Market.

NEW BUILDING BY-LAWS FOR LEEDS.

THE building clauses committee of the Leeds Corporation are engaged, says the *Leeds Mercury*, in revising the building regulations for the city. A draft, numbering 117 by-laws, has been prepared, and copies sent to the Leeds Master Builders' Association and the Leeds and Yorkshire Architectural Society, in order that those bodies may review the list and make what suggestions they think proper. Many of the old by-laws have been retained, a considerable number have been materially modified, and there are some new regulations. With regard to the laying out of new streets, hitherto the minimum width has been 36 feet. Now it is proposed that main thoroughfares shall not be less than 42 feet. There is a proviso, however, that a street may be 36 feet, on condition that at each side there is an area of 6 feet, making 48 feet from house front to house front. A new by-law stipulates that in the case of dwelling-houses to be erected in damp situations there shall be a layer of concrete 6 inches thick or a covering of asphalt. Another provision of a like character is to the effect that in every new building a damp course shall be inserted at a height of not less than 3 inches above the surface of the ground. In order to restrict the use of old bricks in the erection of new dwellings, it is provided that no such material shall form part of an external wall or of an internal half-brick wall, but that good old whole bricks shall be allowed in an internal 9-inch wall on condition that "not more than two-thirds of the same are mixed with one-third of new bricks." Special regulations are introduced with reference to the quality of other materials. For example, mortar must consist of good lime and sand in the proportion of one-third lime and two-thirds sand. There are likewise provisions as to the strength of timbers supporting roofs, floor joists, beams and girders, both in the case of dwelling-houses and business premises. The necessity of providing ventilation, not only in dwellings, but also in places of entertainment and places of worship, has received attention, and further effort has been made to secure efficient sewerage and to provide for the ventilation of drains. The Architectural Society, whilst cordially approving of many of the provisions, have suggested the alteration of a number. We understand that surprise is expressed by some who have perused the draft that no alterations are proposed with regard to the thickness of party walls in business premises. At present such walls have to be of the same thickness as the external walls, and it is suggested that they should not be more than two-thirds as thick. This and other points, however, will no doubt be carefully considered.

TESSERÆ.

Thomas Cooley.

ABOUT Cooley, the Irish architect, little is known. He was born in 1740. His name is connected as designer with one of the most interesting buildings in Dublin, the Royal Exchange, which is now used for municipal offices. This structure was begun by him in 1769, and although of but moderate size is in a style at once noble and ornate; on the exterior a Corinthian order is continued in columns and pilasters, between which there is only a single range of upper windows, the lower part of the intercolumns being filled in with solid rusticated wall, a circumstance that contributes materially to character; nor is the interior less remarkable for both elegance and commodiousness of plan, it being a rotunda inscribed within a square, the circular part formed by a peristyle of twelve columns of the Composite order and covered by a dome. Had Cooley done nothing else this work alone would entitle him to very high rank among his contemporaries for originality and refined taste in design. He also erected the prison called Newgate (1773), in the same city, and commenced the noble pile of the Four Courts, which was begun by him in 1776, but he did not live to complete it, little more than the west wing being erected at the time of his death in 1784, after which the edifice was carried on by Gandon.

Salvator Rosa.

Salvator Rosa's greatest ambition was to obtain universal celebrity, and finding the immense difficulty of attaining his desire by his pencil alone, adopted an expedient as whimsical as it was rare by which he hoped to render his name famous. For this purpose he associated himself with a number of young men who were stimulated by the same motives, and during the carnival, masked and otherwise disguised, represented a company of mountebanks. On these occasions Salvator, as the wittiest and most fluent speaker, was chosen the head or leader under the name of Forbica. This party exhibited themselves in several places, and by their wit and drollery, wherever they went, attracted great multitudes, amongst which they distributed ridiculous prescriptions for different diseases, skilfully adapting them to the various tastes of their auditors. His fame as an actor, a poet, a singer and a musician being pretty well known, he began to apply himself to the grand object—that of

establishing himself as a painter. This he found no great difficulty, as he had already succeeded in ingratiating himself with many who had it in their power to serve him, and he soon had commissions by which he not only acquired reputation, but sufficient profit to enable him to purchase apparel and many other necessities, so that on his revisiting Naples in 1646 he was a very different being from the friendless lad who had excited the compassion of every one who saw him. It was during this residence of Salvator Rosa in Naples that the memorable popular tumult under Masaniello took place, and the painter was persuaded by his former master, Aniello Falcone, to become one of an adventurous set of young men, principally painters, who had formed themselves into a band for the purpose of taking revenge on the Spaniards, and were called "La Compagnie della Morte." The tragical fate of Masaniello, however, soon dispersed these heroes, and Rosa, fearing he might be compelled to take a similar part in that fatal scene, sought safety in flight and took refuge in Rome. There he met with great encouragement and painted many excellent pictures. But though indefatigable in this department of the fine arts he did not entirely confine himself to it, for at this time he wrote some of his satires and also several sonnets. His house was the resort of the most distinguished persons of Rome, ecclesiastical as well as secular, who were drawn thither not merely to see his paintings, but for the pleasure of conversing with and hearing him read his satires. This notice, added to other causes, made him much disliked among the painters—a feeling which was by no means lessened by the following circumstance. Salvator Rosa exhibited a clever picture, the work of an amateur, by profession a surgeon, which picture had been rejected by the Academicians of St. Luke. The artists came in crowds to see it, and by those who were ignorant of the painter it was highly praised; on being asked by some one who had painted it, Salvator replied, "It was performed by a person whom the great Academicians of St. Luke thought fit to scorn because his ordinary profession was that of a surgeon, but," continued he, "I think they have not acted wisely, for if they had admitted him into their Academy they would have had the advantage of his services in setting the broken and distorted limbs of their fraternity that so frequently occur in their exhibitions."

Renaissance Architecture.

The Renaissance in general is usually spoken of as if it were nothing more than a direct but unskilful imitation of the antique, previously to the orders being so well understood as they were afterwards when studied through the text of Vitruvius and reduced to a methodical system of bookish rules by Palladio and Vignola. But in the first place it was founded only upon the Roman antique, and in the next, not upon the temple style of the Romans, but their triumphal arches, baths and other edifices. It was not either the portico or the continuous colonnade, where columniation displays itself in all its purity, that was taken as a model, but rather such structures as the Coliseum, where several small orders—that is, small in proportion to the general mass—are introduced for little more than decoration to it. And in the Renaissance and Cinquecento styles entire orders are used only as embellishment, and avowedly so. Where columns are employed for actual support, as in open loggie, it is only in combination with arches springing from them, the columns performing the office of piers to the latter, which is regarded by some as a most indefensible heresy and utter violation of good taste, though for no better argument than that columns were never so employed in the Classical style, but were originally intended to support a horizontal entablature; in other words, trabeation is essential to them. Essential it certainly is to the completion of an entire order, but it cannot be a whit more contrary to either good taste or good sense to employ columns as actual pillars or supports to arches resting upon them than it is to employ the trabeation or entablature without columns, as decoration in astylar buildings. In fact, a great deal of Italian Renaissance is astylar, with either a full entablature or a cornicione crowning and proportioned to the entire mass. This large and simple mode of treatment was greatly affected by the Florentine and Roman architects of the period of the revival, and contrasts very strikingly with the Transalpine Renaissance in France and other countries, which is characterised by multiplicity of parts and numerous divisions and breaks. It contrasts also with the contemporary practice of the Italian architects themselves when they employed the orders, in doing which they made their compositions microstylar, applying a separate small order to each floor or horizontal division of a façade above the ground floor, and they further reduced the height of the columns by giving a considerable proportion of each order to high pedestals beneath the columns. In Transalpine Renaissance such application of the orders was greatly exaggerated, they being employed for the ground floor as well as the others, and the spaces between the columns being filled in, either entirely or nearly so, with large windows, so that the columns or pilasters between them show only as accessories to the

windows themselves and as narrow piers between them. Fenestration completely predominates, both as to the quantity of surface the openings occupy and the architectural character occasioned by it.

Mouldings.

There are two principles diametrically opposed for the appliance of mouldings, viz. projection and recession. Classical architecture shows the first; Gothic and Norman have adopted the last, and in many cases combine both. This is as regards their relation to the face of wall. Again, the southern and their followers have designed their mouldings for the sake of light, the northern for the sake of shadow. This is as regards their actual forms. The reason why the northern did this would be on account, in the first case, of the inclemency of the climate, its destructive effect on any ornament too exposed to it; and in the second case, from the fact that light is not favourable with us to the production of effect, or the expression of delicate outlines. The principle in both respects, as practised by our forefathers, seems to be correct, because adapted to produce the best effect and the surest protection; but as the thickness of modern walls does not often admit of the same depth of recession, it may be necessary to practise it always in conjunction with the southern principle. Be this as it may, we are sure that nothing is more important than the study of mouldings; but this study so insisted on by all is not what is usually meant, viz. the production of a more beautiful example from a known model; not the making a cyma more delicately exquisite in outline than any known, but the study which shall give to each individual member the tone of the intended expression, both in outline and shadow, for it is necessary that we should be impressed with the fact that even the most simple forms convey an expression of some definite character to the imagination; the nature of this difference was shown before in the three cyma rectas, and the nice perception of this difference is always a great merit in the artist.

Proportions of Buildings.

Alberti says the width of a space being 4 feet, say, and its length 8 feet, the proportionate height—that is, the height most agreeable to the eye—is 6 feet, as equidistant from four and eight, or bearing a relative proportion to each; but draw this form, and in itself it certainly does not appear so pleasing as a double square. Others say, the width being 4 feet and the length 8, the height should be three-fourths, or 3 feet high. The reasonableness of these rules has to be shown, and their good effect is most doubtful; even if true they can only express one quality and, according to circumstances, different proportions are necessary. Utility and propriety should influence an architect in interior house design or all design, and beauty of proportion should give way to this, should be made to square with such requirements as far as can be, but certainly should be subservient; and in all that the architect does he has this drawback on the abstract principles of beauty, whatever they are, which should guide his design.

An Early Surveyors' Guide.

The oldest known book in English relating to surveying bears this title:—"This booke sheweth the maner of measurynge of all maner of lande, as well of woodlande, as of lande in the felde, and comptynge the true nombre of acres of the same. Newlye invented and compyled by Syr Rycharde Benese Chanon of Marton Abbay besyde London. Prynted in Southwarke in Saynt Thomas his hospitall by me James Nicolson." There is no date, but Nicolson's dated works run from 1536 to 1538. There is another edition (which omits the tables) printed by Thomas Colwell, who printed from 1558 to 1575. They are double-entry tables of the rudest character, for finding the number of acres in a given length and breadth, and for casting up payment at per perch, per acre, &c.

Royal County Theatre, Kingston-on-Thames.

SIR,—My attention has just been called to your issue of October 22, in which an illustration of the above appears. You have evidently been misinformed as to the relative positions of the late Mr. Phipps and myself in the matter.

Mr. Phipps acted as consulting architect in the preparation of the plans, but all the working drawings and specifications were prepared by me, and the contract was arranged and carried out entirely under my sole supervision.

I shall be much obliged if you will kindly give a note to this effect in an early issue, as the title on the illustration is apt to give a wrong impression.

I should like to add that any success the theatre is achieving is very greatly due to the valuable suggestions made by Mr. Phipps at our interviews, and it is a matter of much regret to me that he did not live to see those suggestions realised.—Yours faithfully,

J. CHARLES BOURNE.

62 and 63 Basinghall Street, London, E.C.:

November 3, 1897.

Endurance of Poplar.

SIR,—We have a rather fine black poplar, about 7 feet girth, which, from its pestilent habit of distributing its leaves carefully every morning all over the lawn from June 15 to October 15, inclusive, is condemned to the axe. We think of cutting it off about 25 feet from the ground, and building on the branch stumps a sort of gazebo platform, from which to view the regattas. Would it be safe so to do, or will the tree rot within, say, twenty years or so?—Faithfully yours,

C. ADAMS.

Harewood House, Keyhaven, Milford-on-Sea

Hants: October 26, 1897.

GENERAL.

A Committee of the Dundee Institute have recommended the members to decline taking part in any competition for the improvement of Carnoustie Church on the grounds that the size and nature of the work (being only alteration and enlargement) rendered it a very unsuitable subject for a competition; that under the conditions issued competitors were asked to work and furnish information not generally asked in such competitions; that no professional assessor or referee was named; that the remuneration offered was 4 per cent. on the cost instead of 5 per cent., plus travelling expenses.

The Lord Mayor and Sir Edward Poynter, the president of the Royal Academy, with Mr. Temple, the director of the Guildhall Art Gallery, viewed at the Pantechnicon on Tuesday the pictures which Mr. D. P. Sellar has offered to present to the Corporation of London as the nucleus of an art collection in the City. The result of their inspection will be made known to the Corporation and to Mr. Sellar at an early opportunity.

M. Osiris has lodged 100,000 francs with the Bank of France, which is to be placed at the disposition of the syndicate of the Paris press in order to reward the producer of the work which will be considered most meritorious from the artistic, industrial or humanitarian points of view in the exhibition of 1900.

The "Lancet" says that Dr. A. M. Berger has found in the Vatican Library (Cod. Vat., 3,211) a collection of prescriptions and directions for treating various eye diseases in Michel Angelo's own handwriting, obtained probably from medical friends mainly for his own personal benefit, as it is known that the great sculptor was nearly blind before he died. Dr. Berger has published this in its original Italian, with a few notes in German. It appears not to have been previously published, though it is mentioned by Pierre de Nolhac as forming an addition to Michel Angelo's manuscript poems.

The Next Ordinary Meeting of the Institution of Civil Engineers will be held on Tuesday next, at 8 P.M., when a paper will be read, with a view to discussion, on "The Manchester Ship Canal," by Sir E. Leader Williams, M.Inst.C.E.

The Society of Arts have placed a tablet on the house at Hampstead in which Sir Harry Vane formerly resided, bearing the following inscription:—"Sir Harry Vane, statesman, lived here. Born 1612. Beheaded 1662." The house is now known as Belmont, and adjoins the Soldiers' Daughters' Home. Both houses originally formed one residence. Bishop Butler also lived there, and wrote his "Analogy of the Christian Religion" there.

Mr. James Plevins, who was well established in Birmingham as a surveyor, died at his residence in Coventry on Sunday last. He was in his seventy-second year.

Mr. James Orrock, the painter and collector, on Wednesday was awarded by a jury 300*l.* for injury to his eye caused by the opening of a bottle of aerated water in the Café Monico.

St. Luke's Church, Harrogate, which was recently consecrated, has been built to meet the requirements of a thickly populated district and is situated in Walker Road. The foundation-stone was laid on October 20, 1895. The new church occupies a site of nearly 4,000 yards area. The style of the church is Decorated Gothic, rather late in type. The design consists of a lofty nave, 85 feet long by 27 feet wide; chancel, 35 feet long by 23 feet wide; south chapel, 34 feet long by 16 feet wide; north and south aisles, each 13 feet wide; with lofty organ-chamber and commodious vestries. The roofs are chiefly constructed of pitch pine, boarded, felted and covered with Westmoreland slates. The seating is also of pitch pine and will provide for 850 persons. The choir-stalls and chancel fittings are of oak. The cost of the church, exclusive of the upper part of the tower and spire, is about 8,000*l.*

The Architect.

THE WEEK.

IF the Bill which is to be lodged in the coming session of Parliament for the construction of an underground railway in Brighton should become law and the works are carried out, the Sussex town can with more reason be called London by Sea. There are two lines of railway proposed. One will commence at the northern end of Queen's Road, near the railway station of the London, Brighton and South Coast Railway, and will be continued under Queen's Road and West Street to the King's Road, opposite the end of Russell Street, that is, between the Alhambra and the Grand Hotel. The second line, which will serve as a siding, will join the first at West Street, and terminate in the King's Road at the end of Middle Street, not far from the "Old Ship." The gauge is to be the usual 4 feet 8½ inches, and the motive power will be electricity or such other mechanical power as may be prescribed or authorised by the Act. Power will be sought to make communication with the beach through the sea-wall of King's Road. The precedent set up of late years for purchasing no more than the lower parts of buildings will be followed.

ONE of the reports of the school management committee of the London School Board suggests that the adaptation of the earlier schools to modern requirements will be a very costly operation. In February last it was proposed to convert two classrooms for ninety children each into three for sixty children each. The cost of the work was estimated at 316%. The local managers took advantage of the opportunity to recommend the addition of a hall and the extension of the west wing. That means an outlay of 8,000%. The school management committee, or rather a majority of the members, for the chairman and vice chairman dissent from the scheme, now recommend that the larger sum should be expended.

THE annual meeting of the Egypt Exploration Fund was held on Wednesday, when Sir E. MAUNDE THOMPSON presided. It was reported that the total expenditure on the exploration fund account amounted to 2,698%, of which 1,558% was expended on the expedition account. This large amount was due to the fact that two expeditions were undertaken—one to Deir el Bahari, which cost 597%, including the partial restoration of the temple, and the other, under the direction of Professor PETRIE, with whom Mr. BERNARD GRENFELL was associated, worked on the sites Behnesa and Deshasheh. This latter expedition cost 885%, but when it was considered that it resulted in the discovery of the very early statues and objects which were lately exhibited at University College, and the very remarkable papyri, including the "Logia," they would agree that the outlay was more than justified. The total receipts had been 2,488%. Thus expenditure had exceeded receipts by 209%. There had been a considerable falling off in subscriptions, but it was hoped the present year would see a return to the former standard. The expenditure on the archaeological survey had been 464%, against receipts of 563%. The capital account showed that the assets of the Fund and the survey amounted on August 1 last to 2,661%, 215% of which belonged to the Græco-Roman branch, leaving the available assets for the forthcoming year at 2,446%. The Chairman said that in the coming year they proposed to complete the replacing of the blocks of the Punt expedition, to rebuild the columns of the Punt terrace and the wall leading up to the Hathor chapel, and to rebuild the great retaining wall which protects the temple from the *débris* which fell from above.

THE Society of Antiquaries has obtained, through the Foreign Office, some information concerning the practice adopted by various countries for the preservation of ancient monuments. In France "the regulative and restraining authority is only to a slight extent differentiated from the initiating and executive authority over ancient buildings," for

the architect, who should restrain rash alterations, may be the proposer of them. In Bavaria the plans for alterations of historic buildings have to be examined by a special committee, and without official approval they cannot be carried out. The restoration mania is a bar to the promotion of the clergy. Belgium has also a Royal Commission to advise on alterations of ancient buildings. In Rome there has been a commission since 1820. The royal consent is necessary before any changes can be made in the ancient buildings of Sweden and Norway. Italy, and in Italy Rome, may be regarded as the original parent of all legislation on the subject. Its principal work, the establishment of a Commission comprised of officials and experts and artists, specially charged with the preservation of historical monuments, has been followed by France, Spain and Belgium, among Latin countries; by Austria, Bavaria, Saxony, Holland and Switzerland, among Teutonic peoples; by the Scandinavian countries, and last, but not least, by Greece. It is noteworthy that those countries like Italy, Greece and Sweden, in which legislation, though not perhaps the best enforced is the most stringent, and where least regard has been paid to the so-called rights of private property, are precisely the countries in which there is the most immediate hope of future measures in the same direction. The next most important work, the formation of an inventory or register of ancient monuments, whether prehistoric or historic and artistic, whether the objects included in it are or are not placed under the protection of the State, has been attempted in Italy, France, Spain, Austria, Bavaria (so far as concerns prehistoric monuments) and Greece.

FROM a paper read on the Manchester Ship Canal before the Institution of Civil Engineers on Tuesday, it appears that as early as 1721 the necessity for providing efficient water communication between Manchester and Liverpool had been recognised, and many schemes had since that time been propounded. The first company proposing to construct a ship canal to Manchester had been formed in 1825, with TELFORD and Sir JOHN RENNIE as consulting engineers. Docks were to be constructed at Dawpool, on the river Dee, for large vessels, the cargoes being lightered to Manchester, smaller vessels passing to Manchester, a distance of 51 miles. The depth of the canal was to be 15 feet, and the locks 110 feet by 28 feet. In 1838 Sir JOHN RENNIE reported in favour of a ship-canal from Warrington to Runcorn; and in 1840 Mr. HENRY R. PALMER made a report to the Mersey and Irwell Navigation Company on the improvement of their navigation, so as to adapt it for sea-going vessels. No action had, however, been taken on these reports, and it was not until 1882 that the question was revived. In 1885 the Act for the Ship Canal was obtained. The length of the canal to its termination is 35½ miles. The excavation amounted to about 54,000,000 cubic yards, including 12,000,000 cubic yards of sandstone rock. The expenditure of the company to January 1, 1897, was 15,168,795% 15s. 11d., and the traffic increased from 925,659 tons in 1894 to 1,826,237 in 1896.

Is there any precise rule for determining the number of persons that can be accommodated in a theatre? In Dublin a law suit appears to hang on the solution. An injunction was applied for to prevent the erection of a theatre on the site of the old Theatre Royal in Hawkins Street unless it had seating capacity for 2,300 people. The applicant was Mr. GUNN, who holds the patent for the theatre. His architect, Mr. ALBERT MURRAY, saw the plans of the new building, and estimated the seating accommodation at 1,910. Mr. MCCARTHY, the city architect, calculated the number at 2,146. The plans were sent to London, where Mr. MATCHAM and Mr. JACKSON gave the number as 1,931, or 1,991 seats at the maximum. A partner of the late C. H. PHIPPS calculated there were 1,991 seats. There was some amendment of plans, and the city architect found the number rose to 2,322, an excess of the stipulated number. It is no wonder the Master of the Rolls, to whom the application was made, appeared bewildered, and allowed the case to stand over.

SOUTH KENSINGTON LOAN COLLECTIONS.

AMONG the results which are expected from the inquiry into the museums of the Science and Art Department is the enabling of the provinces to have more opportunities for enjoying the national treasures than are now allowed. A miserly reserve of the works of art confided to it cannot be charged against the Department. At the time when it was founded there was hardly a museum that was entirely thrown open to the public. A visitor to the British Museum was supposed to possess the privilege of seeing all the collections. But he must be a bold man who would have dared to act simply on his rights as a citizen and disturb such a keeper as the late Mr. CARPENTER in his enjoyment of rare prints. Sir E. MAUNDE THOMPSON, the principal librarian, delicately suggested a common state of affairs when he told the committee of the House of Commons, "Formerly we had keepers who did not develop departments, they did not develop the staff; the old-fashioned keeper was rather inclined to do everything himself, and to think he could do everything himself." An official who was jealous of an assistant was not likely to welcome the public, and so strong is the conviction of their impenetrability that various departments of the British Museum continue to be as little known to the people of London as if they formed parts of some private museum. If the collections of the Science and Art Department are not familiar to all inhabitants of the Metropolis it is not the fault of the administration. It was also an innovation when the Department endeavoured to give people in the provinces occasional glimpses of the objects which gratified so many eyes in town. Credit should be allowed for so bold an experiment. Facilities for the study of art exist in foreign countries, and the museums in continental towns are remarkable; but in England alone are national collections to be seen travelling from town to town in order to give pleasure to those who are unable to enjoy the advantages of living in London.

As a matter of fact, the collections which are sent about are adapted to conditions of time and place, but in theory, as Sir JOHN DONNELLY says, "Any object that is purchased for the South Kensington Museum is, and shall be, available for circulation." Proprietors of circuses and waxwork exhibitions know that rustic spectators are exigent for novelties, and a collection of objects arranged by Government officers must be submitted to a like law. If the inhabitants of provincial towns were to see the same case with the same trinkets in two successive loan exhibitions they would be wearied. It is therefore an advantage to be able to have recourse to a great collection like that of South Kensington, for although what is taken on one occasion may not be of importance, it will at least be sufficient to raise expectation of more attractive contributions at another time. There are towns which enjoy what is called a permanent loan of objects belonging to the Department, but there is no permanency, for experience proves that there must be a change at least once a year. The attention of students cannot be kept up for a longer term. In many towns, after three or four days the limit of the attractiveness of a collection is reached.

It is easy to conclude that if a loan collection does not "draw," or for only a brief time, the reason is that the objects were selected by officers who are ignorant of local needs. The officials are answerable for many costly failures, but they must be held guiltless of the charges made against them as showmen. The objects shown in local exhibitions are selected by local men who in some way claim to be judges. They are allowed to visit the collections at South Kensington, and to select whatever is considered most eligible. Who can say what principle inspires them? There are rigorous censors who hold they should not be allowed to have an object which does not relate to the staple industry of the town in which the exhibition is to be held. But are Londoners always thinking of production while they linger over the cases in the South Kensington Museum? In most instances they are simply deriving pleasure from the sight of beautiful objects, and why should provincial amateurs be prohibited from a like enjoyment? Moreover, there is a good deal of conventionalism about the notion of a staple industry. It is found that advantages are derived from having allied industries in one place, and a glance at the directory of any

provincial town will suggest that of late years the success of any trade is an incentive to attempts being made in various others. To insist on Manchester receiving cottons alone, that Birmingham is to have every year fine jewellery which is to be imitated in examples costing a few pence, that Nottingham is to be restricted to lace and Belfast to ancient linen, would be ridiculous. Take the last city. If a collection of models of liners were sent to Belfast there would be many to enjoy the absurdity, but as it is not improbable that shipbuilding will become a rival of weaving, an exhibition of models of vessels would not be very inappropriate. Incipient industries deserve encouragement, and we imagine that many of the local exhibitions which have excited ridicule were got up with that intention.

We believe it is wise to leave as little as possible to the choice of the Department's officials, for it is only on the spot that the requirements of the inhabitants can be ascertained. Moreover, there is more likelihood of success when the loan collection is supposed to correspond with the good taste of local amateurs. Sir JOHN DONNELLY handed in to the parliamentary committee a great many testimonials of the Department for sending objects to be exhibited, and of the courtesy, anxiety, care, kindness, attention, help, support, &c., shown by the officers. It is a revelation to learn that such excellent qualities are to be found in operation at South Kensington. Never before was there such an array of grateful effusions. But the gushing becomes plain if we remember that the Department simply agreed to the desires of the honest folk who came to the museum to select objects. In admiring the objects contributed, and in eulogising the officials, the provincial committees were praising themselves for the judgment they exercised, and which the authorities could not help approving.

It is impossible to determine the success of the local exhibitions, for often the full effects of one may not be visible for years. Who can measure the influence of a fine example of pottery on the minds of apprentices in Burslem? But whatever may be the success, it is not gained by any injury to the national or to private property. When the frailty and delicacy of many of the objects are considered, it is remarkable that hitherto they have escaped all the mishaps to which the movables of ordinary individuals are liable. Sir JOHN DONNELLY in his evidence observed:—"It is an astonishing thing to say, but I have never heard or been able to find out that there has ever been any serious damage to any object of value. No doubt in some cases furniture, especially old furniture, has got a little rickety and shaken by travelling in the vans. But we had some very magnificent Sevres china that belongs to HER MAJESTY, which travelled, I do not know how many thousands of miles, and was returned some few years ago without a chip or damage to them, although they were always out on loan." The safety is the more fortunate, since insurance is not provided for in any sort of Government property. The Department provides the cases used, the objects are arranged by trained assistants, then the cases are locked until they are returned. The cost of the objects sent out in one year was 102,865*l.*, and it has been calculated that, if large architectural subjects and sculpture were excluded, "a very full quarter of the valuable objects were in circulation" from the South Kensington Museum. It must therefore be admitted that, if the provinces contribute towards the cost of the collections in charge of the Department, there is some return.

The removal is not an unmixed advantage. Naturally a student of any section of industrial art who seeks one of the museum examples is disappointed when he discovers it is peregrinating Wales or Scotland, but the inconvenience cannot be helped. He would hardly be satisfied with a reproduction as a substitute, and provincial towns would be offended if they were compelled to forego the sight of originals. The students of schools of art might be more easily contented, but for exhibitions in municipal buildings reproductions are almost useless.

The demand for objects on loan is growing, and the grants from the Treasury are not increasing in proportion. The South Kensington Museum cannot be entirely stripped of the contents of the cases. To meet the difficulty Mr. PURDON CLARKE has suggested a scheme which would serve local art classes especially, without impoverishing the collections

of the museum or adding much to the taxation. He would combine photographs, casts or other reproductions and actual examples, according to the class of work. Wood-carving would be illustrated by sets of photographs, details, casts, and a few actual specimens of Gothic and Renaissance work. In addition to photographs of textiles there would be fragments of stuffs, and when the latter were not available coloured photographs would be substituted. For pottery small collections of tiles and fragments would be used with plain and coloured photographs. Photographs and electrotypes would be utilised for metal-work. In each case there would be a special catalogue and a set of lantern slides for lectures. If systematically carried out the plan would be excellent in art classes, but for popular exhibitions it might be less successful. Something will have to be done to meet the demand, which is as much inspired by a fear of monopoly by Londoners as by a desire to improve manufactures.

ELECTRIC TRAMWAYS.

By F. J. WARDEN-STEVENS, A.M.I.E.E.

(Continued from page 260.)

Apparatus on the Car.

THE methods of control, the gearing and starting arrangements of the cars are of great importance in connection with electric tramways, and the same principles apply to all electric tramcars.

Starting and Control.—The first matter which calls for attention is that of the electric motor, as upon this depends the whole principle of the control.

Without going too deeply into the theory of an electric motor, it is necessary here to briefly discuss the construction. It may be said to consist of two parts—a magnetic field and a coil of wire, the latter usually being the revolving part. The main current is sent through this coil of wire, which then reacts on the magnetic field, causing a torque or twist, which is transmitted to the wheels of the car. The electrical resistance of this coil of wire, which is the armature, is very low, otherwise there would be a large waste of energy in it when the current is passing; and for this reason, if the motor is switched directly on to the dynamo or generator while stationary, an enormous current would be sent through it, which would probably burn the insulation of the wire. When, however, a motor is running it generates a back pressure, which keeps back the current to a reasonable amount. A motor running without load will rotate at such a speed that its back pressure nearly equals the pressure at which it is supplied. The current is thus reduced to the exact amount which the motor requires to do the work. It is evident from the above that until the motor gets up speed some means must be taken to keep the current within limits. One means would be to insert a small resistance in the motor circuit until it is running at its proper speed, and then to connect the motor to the car by means of a friction clutch. As a matter of experience this is not done, because of the unreliability of these clutches.

It will be well here to explain why such a large motor as 30 or 40 horse-power is required on a car which two or three horses can start.

The weight of a car is usually about 10 tons complete, with passengers; and for example we will suppose that it is to run at 9 miles per hour, and that 15 seconds are required to allow of this speed being obtained.

$$\begin{aligned}\text{Kinetic energy} &= \frac{1}{2} \text{ mass} \times \text{velocity squared.} \\ &= 10 \times 2240 \times 13.2 \times 13.2 \text{ ft.-lbs.} = 60605. \\ &\quad 32.2 \times 2\end{aligned}$$

To do this in one-third of a minute, making no allowance for friction, needs an average of just under 6 horse-power. As, however, the horse-power of a motor is greater as the speed increases, and the average speed is only half that at 9 miles an hour, the motor must be rated at 12 horse-power merely to start the car in motion on the level, assuming no friction. When allowance is made for the facts that the car may have to be started on a gradient, that the resistance to any motion due to friction has to be overcome, and allowance is made for the heavy starting strain and for the waste in gearing, it is quite clear why the motor

must be of 30 horse-power. Of course, a horse can exert much more than a horse-power for a short time, as the definition of a horse-power by WATT is the power that can be exerted by a horse continuously.

The motor which is specially suited for tramway working is the series type, as in this type the field magnets carry the main current on its way to the armature, and so strengthens the field, increases the torque and allows the armature to exert a large back pressure when running slowly. With this type of motor, therefore, we have the nearest approach to the ideal conditions.

It is evident with one motor that extra resistance must be placed in the circuit at first, to keep the current within limits, which resistance is gradually cut out as the speed of the car increases. This is the usual method of control.

It has of late years been the practice to use two smaller motors on each car, these being placed in series at starting and paralleled later. The placing of the motors in series reduces the starting current very much, as it is nearly all used usefully, the starting torque is the same with two motors and half the current as before, and the resistance can be cut out entirely when the car has attained half speed. To increase the speed the fields are paralleled while the armatures are in series, and later the armatures are paralleled, or the last two operations may be reversed.

By this means the control of the speed on a car is almost perfect, without the use of extra resistance except at the very start. This method of control is called the "series parallel."

The very latest method of control is the "Johnson-Lundell." This is similar to the series-parallel arrangement, but enables one large motor instead of two smaller ones to be used. The armature has two windings, and so also has the field, the former having two commutators. These windings are used in exactly the same way as with the ordinary series-parallel control.

Where accumulators are used on cars there is not so much need of a series-parallel control. One motor may be used, and the accumulators connected in parallel at first and in series afterwards. This is just as good as the series-parallel connections on the motor. A combination of series-parallel connections on both accumulator and motor would no doubt be an ideal system.

The only objection to this system is the fact that accumulators are not always uniform, and when paralleled might not perhaps share the load equally.

Gearing.—This is the chief problem which remains to be faced in connection with tramway running. There are many systems of gearing, and perhaps it will be of interest to give a list:—

- 1, Direct coupling; 2, toothed gear; 3, worm gear; 4, belt drive; 5, ropes; 6, friction gear; 7, chain.

Nos. 4, 5 and 6, although they have all been tried, are hardly feasible, owing to moisture in the air, change of temperature and the effect of mud splashing. These defects are of a serious nature when it is remembered that the car must run in all weathers, but when the starting strains are taken into account and the tendency to slip, it will be seen that any gear working on the friction principle is impossible. The chain gear is also of a rather unsatisfactory character, as the wear is very serious; however, it is not affected by temperature, and this is a great point in its favour.

The first three gears on the list are those which have demanded the greatest amount of attention and are really serious competitors.

There is no doubt that a motor direct coupled to the axle is the best form of gearing as regards efficiency and reliability. No form of intermediate gear is then required, but the motor is heavy as it runs at a slow speed, usually about 120 revolutions per minute on a tramcar. It must not, however, be supposed that the weight of the motor is an insuperable obstacle, as the greater part of the weight is direct on the axles, and therefore it does not increase the weight of the car as much as the same weight of accumulators, say, would, as no extra strong framework is required. This form of driving is no doubt destined to be the survivor, and as methods of motor construction improve it must take a more prominent place.

On electric railways where the speed is higher than with tramways, the direct coupling is already accepted as the standard method of driving.

Spur-gearing is at the present time the most used form of gearing for tramcars. The use of accurately machine-cut teeth, and the results of experience in the use of different metals, have done very much in the achievement of success. The result of experience with toothed gearing in general has been that the spur wheel and pinion should be of dissimilar metals or materials. It has been found very good practice to use phosphor bronze for the driver and steel or iron for the driven wheel. In some cases the driver is made of raw hide; in others the teeth are of wood, fibre, &c.; but there is not much experience in the use of the raw hide or fibre as yet.

The method of suspending the motor calls for attention with spur-gearing. The field magnets are often connected to bearings running on the car axle, the armature shaft being at a distance from the car axle equal to the sum of the radii of the pitch circles of the driving and driven wheels. When arranged in this manner the whole motor may be swung round the axle, while the two wheels will remain in gear. The framework of the motor is supported by means of springs fixed to the car frame. Thus one end of the motor is connected to the axle by means of bearings and the other to the car frame by means of springs. By this means the bad effect of jolting is minimised, while the wheels always gear perfectly. Another advantage of this method of suspension is that at starting the motor pinion as it were climbs up the gear wheel; this takes off the shock of starting, allowing the armature to rotate a little, while the weight of the motor is used to assist starting in much the same way as a horse uses its weight in starting. Worm-gearing between the motor and the car has often been tried, but with indifferent success as a rule. The chief drawbacks to it are the great amount of attention required, the end thrust which must be taken up by some form of thrust block and the inefficiency when the worm and wheel wear slightly. Worm-gears are almost always run in oil to reduce the grinding action between the worm and the wheel teeth. In a properly designed spur wheel the action is a rolling one, but in a worm-gear there is a rubbing of metal on metal which cannot be obviated, at least in the form of worm used up to the present. The efficiency of a well-designed spur-gearing averages about 60 to 70 per cent., but that of a worm-gear will not exceed 50 to 55 per cent. after a few weeks' wear.

It will be seen that a direct drive has the advantage of an efficiency of practically 100 per cent., and for this reason the motor need be only about two-thirds as "powerful" as one with an intermediate gear. This fact considerably helps the direct coupled system, as the motor need not be as large in proportion as its speed is decreased. When the waste of energy and noise of gears are taken into account, there is very little doubt that the direct-coupling principle will be the survivor.

The Central Station.—The conditions of running of a tramway plant are very different from the conditions of ordinary work. One case which is a good parallel is that of an engine driving heavy machine tools or similar apparatus. The load jerks on and off with a great effect on the speed of the engine and its working parts. In the first place there is the variation of load with the time of year and time of day; these vary considerably with the service and the habits of the people. Then there are the great variations due to the gradients, condition of track, &c., and lastly the great fluctuations due to starting the cars, either on a gradient or on the level. These fluctuations cause the load on the dynamo to vary between nothing and twice full load; as a rule, this may take place in a few seconds.

From this it will follow that the maximum load obtained depends more upon coincidence than anything else; the highest load would be obtained if all the cars happened to be starting at one instant. When this is the case the plant used will depend upon the number of cars in use at once. As this is usually a large proportion of the whole, the greater part of the plant must be running. This means that a tramway plant should consist of about two or three large units, one being a reserve, as the load varies so quickly that extra machines could not be run up in time to meet heavy demands.

It is evident, then, that the design of a plant for tramway working is a different matter from that in the case of a central lighting station. The question of governing is of the greatest importance, and the large units must run

economically at about half-load; while they must be capable of running at full, or even 25 per cent. in excess of the usual full load without danger, and also the engine must be designed so that in driving the dynamo it will stand any shock caused by sudden overload. The solution of the difficulties has come through the medium of automatic expansion engines, and partially by the use of accumulators paralleled on the mains, which to a great extent take up the fluctuations; and further by the use of heavy fly-wheels on the engines. The question of automatic expansion governing is certainly rather too complicated to discuss fully here, but the whole point may be put shortly. To obtain economy from a steam-engine two facts must be borne in mind—(1) That a high expansion is desirable, because the steam is at a lower pressure when exhausted; but (2) a high expansion means a large engine, as the mean pressure is low, and a large engine means heavy condensation losses. There is a particular expansion which gives the best result in any engine; it varies with the engine, but can be obtained by experiment, and in a variable expansion engine the valves should be arranged so that this is the expansion which gives the usual average load. This point is usually about two-thirds of the ordinary full load, with a variable expansion. However, the ordinary full load is when the cut off of steam is at $\frac{1}{6}$ of the stroke, and thus the percentage of the actual capacity of the engine is $\frac{2}{3} \times \frac{1}{6} = \frac{1}{9}$ of the total. Fortunately, as a rule the engine for tramways usually works at about 50 per cent. of the maximum load ever on, so we have the engine working at its best load. When doing less or doing more the economy is hardly as good; in fact, it is usually much worse. However, it has been fairly proved that the economy with a variable is better than with a fixed expansion at $\frac{1}{6}$ of the stroke and throttle governing, especially at loads above two-thirds of the full ordinary one.

Shaft governors are said to act so quickly that the load is met with only about 2 per cent. variation in speed. The fly-wheel has a function entirely apart from the governor. The latter cannot act in less than one revolution, and therefore it is necessary to prevent sudden strains affecting the reciprocating parts. The fly-wheel stores sufficient energy to be able to meet the greatest fluctuation which ever occurs, without being reduced in speed more than 2 or 3 per cent., while the governor adjusts itself to the new conditions.

The point which always appears when the question of the engine for traction is mentioned is the belt drive *versus* direct coupling. In the former case it is supposed to be necessary to have a slip between the belt and pulley, and also an elasticity in the belt to prevent the shock from reaching the engine when a car is started. This has been proved to be little more than a superstition. There are a great number of direct coupled plants in America working satisfactorily. The reason for this may be set down to the fact that the fly-wheel is combined with the armature of the dynamo, and because of this any sudden increase in power demanded, which must be caused electrically by the rush of current, is supplied by the fly-wheel on slowing down a little without being transmitted by the crank shaft, and the shock to the engine is only that due to its being slowed down slightly. The twist on the crank shaft is, therefore, never in any large excess over the normal. The flexibility of the belt is really very little at the enormous speed at which it travels, as any one can see by striking a fast moving belt with a stick, and the slip is not to be depended upon.

The essential point to bear in mind in the design of any traction plant is that the fly-wheel action must be provided where it can act on the dynamo without going through the crank-shaft, such as on the driving pulley, or the dynamo armature, and that a larger factor of safety should be allowed in the engine parts than is usual.

(To be continued.)

The Second Members' Meeting of the fiftieth session of the Liverpool Architectural Society will be held on Monday, November 15, in the Picton Library, William Brown Street. A selection of the most valuable architectural books in the library will be on view from 5.30 till 9.30 in the librarian's private room. Professor Simpson will read a short paper on "The Use of Books."

G. B. CAVALCASELLE.

THE Roman papers announce the death of Signor Giovanni Batista. Cavalcaselle, who has thus lived little more than a year longer than the late Sir Joseph Crowe, the friend with whom he collaborated in the production of the notable art histories which bear their names. According to the obituary notice in the *Times*, Cavalcaselle was born at Legnago in 1820, his family being settled on a small family estate there; but he left his native place early in life in order to study art at Padua. He soon became tolerably efficient in mastering what can be taught by professors, but he never showed original power, and threw up the profession of painting after awhile and turned his mind exclusively to the study of the styles and technique of the old masters. In prosecution of this design he visited in succession most of the museums of Europe. Sir Joseph Crowe in his "Reminiscences" told the salient points of his career, and related that he first met him by chance whilst posting in Westphalia on his way to Berlin. This was in the year 1847. Then followed a checkered career for Cavalcaselle, owing to his ardent Liberal views. He first joined Mazzini at Venice in 1848 and next year enrolled himself as a Garibaldian soldier at Rome. The hardships then endured, aggravated by the smart of being more often than not compelled to retreat before superior forces, used to be amusingly dilated upon by him afterwards. It is enough to mention here that he was taken prisoner at Piacenza, and only escaped the death which overtook his three companions owing to the timely retreat of Radetzki, who was obliged to retire before the insurgents, and to release him from duress and imminent death. Next year, 1849, found him in the trenches fighting the French as a common soldier. When the French entered Rome those who could escape, Cavalcaselle amongst them. He managed to get to Paris in a tattered condition, and was conveyed by friends to the safer shelter of English shores. Here he earned what was in those days the precarious living of an illustrator, now drawing outlines of famous pictures for art histories and now working at elaborate, large-sized cartoons, used in lecturing by popular art teachers. Now also began his collaboration with Crowe. Whilst to one collaborator was given exclusively the task of collecting notes and facts, the other wrote down the resulting judgments, after they had together discussed documents and viewed the pictures commented upon. Unlike some pairs of workers in literature—notably MM. Erckmann and Chatrian—Crowe and Cavalcaselle worked on to the last without friction. The first appearance of the fruit of their labours was in 1857, when the single volume, "Early Flemish Painters," came out. The last was the "Life of Raphael," which was published in 1882, a quarter of a century later. The intervening works were a "History of Painting in Italy" (1864), "History of Painting in North Italy" (1871), and "Life of Titian" (1877). Both for their learning and for their appreciative art criticism these volumes have been, and continue to be, highly valued by students of painting.

Cavalcaselle used to relate an incident which gives some idea of his pertinacity in search of pictures that it was necessary for him to see. The owner of a certain gallery had granted permission for him to go round it. The family happened to be absent at the time, and Cavalcaselle was conducted through the rooms by the domestic cicerone. But, not noticing anywhere the little Van Eyck which he had gone expressly to see, Cavalcaselle sat down and declined to look at anything unless the work he was in search of was forthcoming. The maid-servant was at her wits' ends, when, suddenly recollecting that a small panel, wrapped in paper, had been stowed away in a drawer, she fetched it; and the delight of the visitor was great at the discovery. He immediately copied Van Eyck's well-known motto upon it, "Als ikh Kan," which, no less than the workmanship, attests the authenticity of the little Madonna.

It is pleasant to reflect that gratitude for services rendered by Cavalcaselle in solving knotty problems of authorship, whenever fresh additions to our National Gallery were in contemplation, induced Sir Charles Eastlake, then in charge of it, to bring to bear sufficient influence to restore the exile to his own country. This was done with no little amount of opposition. When, however, the Italian Government was reconstituted he was given office, first as Inspector of the National Florentine Museum, and subsequently as Chief Inspector of Antiquities and Fine Arts at Rome.

Allusion has been made to Cavalcaselle's narrow escape at Piacenza. Equally melodramatic was an adventure he had in time of peace. In some small Italian town, after an altercation at a café, he was dogged home by three irate companions who resented his utterances. They surrounded him, but he stood at bay against a wall. First one man on his left then another on his right stabbed him. The third aimed at his abdomen, but in the nick of time Cavalcaselle bent forward and somewhat diverted the aim. He fell senseless, however, and was left for dead. After awhile he got up, and soon, by good luck, friends passing by recognised him and took him home. He made a wonderful recovery, and used to remark afterwards, "It was lucky for me the stilettos were not poisoned." His powers of

endurance were remarkable. He knew perfectly well the names of the perpetrators of the outrage, but he never would divulge them. He had a sincere admiration of England and Englishmen, though he could never speak a word of their language except in a broken fashion.

THE HELLENIC SOCIETY.

THE first general meeting of the Society was held on the 4th inst. at 22 Albemarle Street. Mr. Talfourd Ely presided.

Professor Ernest Gardner read a paper on a Greek vase in the museum at Harrow School. This vase, he said, of which the subject was Caeneus and the Centaurs, was the gem of the collection which was presented to the school museum by Sir Gardner Wilkinson. It had recently been admirably cleaned, in common with others, by Mr. Sharp of the British Museum, and we might now be tolerably sure that all that was left was the work of the original artist. The figures painted on the vase were those of Caeneus, who had wounded the central Centaur. The latter was about to hurl a huge stone on the hero. Two other Centaurs on either side held pine branches with which they were about to strike Caeneus. The drawing was wonderfully vigorous and belonged, undoubtedly, to the best period, and no hesitation could be felt in assigning the vase to the age of Euphronius or Onesimus. The fishy eye and fierce aspect of the middle Centaur and the subtle gradations of expression from the more or less savage appearance of the two Centaurs on the sides to the delicate features of Caeneus were efforts of marvellous skill, and the bold invention exhibited in the drawing was probably due to Euphronius himself. The legend of Caeneus was one of the most interesting in Greek mythology. It was found in various forms from Homer downwards, and the beginning of it was to be traced to the battle with the Centaurs at the wedding of Peirithoos. In one version Caeneus was overwhelmed with stones and sank straight to Hades. Pindar used the words *σχίσας ὀρθροπόδι γὰν*. According to Ovid he emerged as a bird, and Virgil speaks of him in the Shades as "Juvenis quondam, nunc femina." His connection with the pine was only one of many indications of the sanctity of the pine, as shown with respect to Pentheus in the Bacchae and in the story of Atys. The origin of the myth was obscure, but the most probable was that which explained it with reference to spirits of the woods, as the belief in such spirits was very widespread among all primitive people.

Mr. G. Beardoe Grundy then read a paper on the topography of the battle of Salamis.

THE SOCIETY OF ARTS.

THE first meeting of the one hundred and forty-fourth session will be held on Wednesday evening, November 17, when an address on "The Colonies: their Arts, Manufactures and Commerce," will be delivered by Major-General Sir Owen Tudor Burne, G.C.I.E., K.C.S.I., chairman of the Council. Previous to Christmas there will be four ordinary meetings, in addition to the opening meeting.

November 24, "Progress of Metallurgy and Metal Mining in America during the last Half-century," by Professor James Douglas. December 1, "The American Bicycle—the Theory and Practice of its Making," by Professor Leonard Waldo, D.Sc. December 8, "The Stockholm Exhibition of 1897," by Bennett H. Brough (the Right Hon. Sir Bernhard Samuelson, Bart., F.R.S., will preside). December 15, "The Purification of Sewage by Bacteria," by Samuel Rideal, D.Sc. (Sir Douglas Galton, K.C.B., F.R.S., will preside).

Papers for meetings after Christmas:—"The Protection of Industrial Property," by J. F. Iselin. "The Projection of Luminous Objects in Space," by Eric Bruce. "Aeronautics," by Captain B. Baden-Powell. "Fruit Growing," by Cecil Hooper. "Stage Mechanism," by Edwin O. Sachs. "The Recent History of Papermaking," by Clayton Beadle. "The Preparation of Meat Extracts," by C. R. Valentine. "Children's Sight," by R. Brudenell Carter, F.R.C.S. "Fireproof Construction," by Thomas Potter.

The meetings of the Indian Section will take place on the following Thursdays, at 4.30 or 8 o'clock:—January 20, February 17, March 10, 31, April 28, May 19.

The meetings of the Foreign and Colonial Section will take place on the following Tuesday afternoons at 4.30 o'clock:—January 18, February 15, March 15, April 5.

The meetings of the applied art section will take place on the following Tuesday evenings, at 8 o'clock:—January 25, February 22, March 8, 29, April 26, May 17.

The following courses of Cantor lectures will be delivered on Monday evenings, at 8 o'clock:—Eugene F. A. Obach, Ph.D., F.R.S., "Gutta Percha," three lectures, November 29, December 6, 13. Cyril Davenport, "Decorative Bookbinding,"

three lectures, January 24, 31, February 7. Hugh Stannus, "The Principles of Design in Form," four lectures, February 14, 21, 28, March 7. Professor W. Noel Hartley, F.R.S., "The Thermo-Chemistry of the Bessemer Process," three lectures, March 14, 21, 28. Dr. D. Morris, C.M.G., "India Rubber," two lectures, April 18, 25. Professor Carus Wilson, "Electric Traction," four lectures, May 2, 9, 16, 23.

ELECTRIC CURRENTS AND BUILDING MATERIALS.

THE following report of the special committee of the American Institute of Architects appointed to consider "The Influence of Electric Currents on Adjacent and Surrounding Materials," was presented to the Convention at Detroit by the chairman, Mr. James B. Cook.

As chairman and on behalf of the committee appointed at your last convention to consider and report upon the "Influence of electric currents on adjacent and surrounding materials," I beg to say that we have given the subject considerable thought, study and investigation, and we also find that the study of these questions leads on to the study into such laws of the physical sciences as are in a measure intimately connected with the same. This study collectively is, in our opinion, one of the greatest interest to the architectural profession, in a scientific point of view, for it opens up new avenues of thought, new theories and new developments. It banishes old accepted ideas as laid down in the text books for new formulas and more progressive thought; therefore, to make the subject intelligible to those who are interested in the same, to enter more fully into it on account of its importance, and, again, as there is to be a "standing committee on the applied arts and sciences," this matter will naturally come under their control. Such being the case we feel desirous, as this subject is one of a series and one entirely new to the Institute, to commence on the same by an introduction into the "phenomena of electricity," and in doing so we ask your indulgence if you find we are wandering somewhat remotely from the text as laid down, but we deem it necessary, this wandering, in order that the true path may be discovered, for as yet in all that has been written on the subject of electrical causes and effects little is known, new paths have to be found and the old ones abandoned; and while we must acknowledge brilliant results have been obtained, which in a measure are, in the greater development of the spark and power, caused only by an increase of the developing power and its generators, yet as to actual causes the mystery is still unsolved.

The old familiar question, What is electricity? that is asked in every text-book on electricity, and is answered by saying that it is an imponderable fluid capable of traversing the air, the earth, and especially all metals, and for commercial purposes flows through iron or copper wires in an invisible fluid state, has no foundation in fact; but advanced electrical scientists to-day recognise no such theory and are free to admit that the exact nature of electricity is unknown. The sources of electricity, such as are termed frictional electricity, hydro electricity, pyro electricity, magneto electricity, thermo electricity, animal and vegetable electricity, &c., are not different kinds of electrical force. Electric force or energy is of one kind only, no matter from what source it may originate. With these denials we are brought to our belief, and to give force to the same we call your attention to the wonders of creation. The visible and invisible worlds, the mightiness of the planetary and stellar systems, our world and all it contains, and the unseen force that regulates the movements of all that is contained in the whole universe, from the largest planet to the smallest atom of dust, each and all are under one law, one force. This law has no deviation; it is the same for a part as for the whole. In order to well understand this law it is necessary to consider the theory of atoms.

By this theory of matter we are told that all substances, either fluid, gaseous or solid are made up of atoms. These atoms are the ultimate diminution of each particle; that the atoms are absolutely unalterable in size, shape, weight and density and are unaffected by any known physical force, but nevertheless possess a definite size and mass, and according to the latest authority the smallest particle of matter, 1,400 of a millimetre in diameter, will contain about 30,000,000 atoms. This theory of atoms extends from the centre of our globe to its surface and all things about the same to our atmosphere, and to all the systems of the heavens and its limitless region and to all things visible and invisible.

It is not possible in a report of this character to enter into a full explanation of the theories advanced; we can but call your attention to them in order to complete a chain of reasoning.

Our next and most important consideration is that of the ether that pervades every vacant space of the whole universe; it penetrates everywhere in the animal and vegetable kingdom; everything that is organic or inorganic pervades everywhere

to the utmost limits of the limitless universe; it is the invisible medium that connects everything from the minutest atom to the sun, moon, planets and stars of our own system and of all other systems, known and unknown. It is the medium in which they all maintain their position in space, sustaining them as they perform their various revolutions. This ether was in the beginning before the creation of the universe; it filled the limitless space that before was a void; it was the first creation.

This ether is a material substance of a more subtle kind than visible bodies and is totally different from the atmosphere that surrounds our globe.

The transmission of light, heat, electricity and sound are due to this ether medium. The atmosphere has nothing to do with it. Our atmosphere has its specific functions to perform perfectly independent of this ether medium, and it is to this ether alone we must look for the solution of the phenomena of light, heat, electricity and sound. Atmospheric air is a necessity for the production and maintenance of life in the animal and vegetable kingdom.

The true study of the distribution of heat must be made through a study of the ether medium, and also alone can we solve the great problem of acoustics only through a study of the ether medium, as also the study of light and electricity, all as in connection with the great problem of the life and existence of all buildings.

Briefly we have given this introduction, for it is impossible in our allotted time to do otherwise, although volumes might be written on it, so wonderful is it in all its various phases, but we have merely entered into it for the purpose of a foundation for further investigation.

I now hold in my hand a small piece of iron ore; I choose iron from the fact of its being a substance in which we have the greatest familiarity, being the most extensively distributed and one of the most important of all metals, not only to mankind at large, but particularly to us as architects. It has been in use from time immemorial, and marks the gradual progress of the human race from barbarism to civilisation.

The reduction of ore to its necessary condition to be wrought into useful forms, from the simplest tool to the most complex machine, also in all forms for peace as well as for war, all combine to excite the energies of the people for its acquisition, whether by labour or commerce, impelling a greater mental activity and a greater civilisation. It is the greatest of metals for the material advancement of national intelligence and industry.

This iron ore as we now see it must undergo a reduction or smelting to eliminate various earths and salts in which it is combined; after this operation we have the ordinary pig-iron of commerce—cast-iron as it is commonly called.

This piece of iron I now hold in my hand is a specimen of the ordinary cast-iron of commerce; from this cast-iron wrought-iron is made and also steel. Observe this piece of cast-iron; to the naked eye it seems to be of a crystalline character—very compact and of a bluish colour. Now, if we observe this piece of iron through a magnifying glass, we find that the interstices between the crystals are again filled with smaller crystals, and as we increase our power of observation we still discover smaller particles, and so on increasing to infinity. With the point of this very fine needle I take up a minute portion of this iron. You cannot under any possible condition with the naked eye see the particle on this point, but under a very powerful microscope we can see it; it is an atom of iron so small that 1,400 of a millimetre in diameter will contain about 30,000,000 atoms. Now, all we have been talking about, and all we have been saying has been for the purpose of introducing to you this atom, to the naked eye perfectly invisible, yet this atom and he ether of the universe play the most important part in the creation of all things. The atom as already described, though exceedingly small, possesses a definite size; the atom is indivisible and unaffected by heat or cold, or by any known physical force. As an atom, its life is from the beginning to the end indestructible and for ever. Now, this little atom on the point of this needle seems a small thing to talk and write about, but to us all it is a most important factor, and deserves a deep research and important investigation.

If we take our own globe, the earth, it is but an atom in the whole universe. We find it has an envelope or atmosphere of its own, extending up forty-five miles. Investigation tells us that there is an atmospheric envelope to all planets and stars, but the kind of atmosphere is unknown. Take our atom of investigation, it too has its atmosphere, an envelope of its own; not only it, but every other atom of whatever kind, liquid, gaseous or solid.

This atom existing in this envelope or covering has a potential force, and has under certain conditions great energy, and under other conditions can assume polarity. The power of the atoms exercised on their envelopes sets up the power of cohesion, one as with another, which is the law of cohesion. The loss of the power of this atom to set up the cohesive force produces non-cohesion or disintegration, and decomposition.

takes place. The life or cohesion of the atoms of a mass of material depends on the life and ability of the atom to maintain the cohesive force in the envelope, and as soon as that life ceases the cohesive force ceases.

Under all conditions in the inorganic materials of the earth as they exist in their original condition the atoms of the mass are at rest. A disturbance of the mass causes a movement of the atoms causing energy; this energy is productive of heat, light and electricity. The ether, as described, is the medium that makes manifest to our senses these phases of the atom energy; without this ether medium no sensible conveyance could be made.

The envelope or covering of the atom is of the greatest importance in the economy of all matter—the atom is merely the germ of the envelope. The envelope constitutes the nature of the material, whether iron, copper, gold, silver, &c. The atom itself is neither, and its nature cannot be determined by any known analysis as to its composition, for it has none, but the envelope assumes all that is wanting in the atom except electrification, and that belongs only to the atom; the envelope assumes none of it, but the envelope is the receiver after having been created by the atom.

Agitation, rotation or vibration, when applied to these atoms, produces electrical manifestations; the greater the increase of these forces the greater the manifestations.

There is another condition of all matter, viz. a sympathetic manifestation. A body that is in a state of electrification will induce another body some distance away to a similar condition of electrification, and that without any contact or connection. This condition being brought about by the ether medium, this ether medium being the communicator.

We again find that magnetism is the normal and latent condition of all matter, and that the law of cohesion, as between all atoms, is the result of magnetic influence. Electricity, we find, is caused by disturbing or bringing into life the latent magnetism, and the result is to destroy cohesion and produce disintegration.

We sum up by saying that cohesive force is the result of magnetism and that disintegration is the result of electricity.

Magnetism is a conservative force and pervades everywhere; electricity is a destructive force and the primary cause of disintegration.

Briefly we have called your attention to the ether, an invisible medium pervading every void of the universe, either solid, liquid or gaseous; a most important factor in the study of heat, light, electricity and sound. We have also called your attention to the theory of atoms and cohesion, also to magnetism as a necessary condition and pervading all things, and to electricity as a destructive or disruptive agent, which, unlike magnetism, does not exist in nature as a force, but is brought into existence by agitation of some kind.

We now come to the consideration of the effects of electricity or electric currents on the materials of buildings. The atoms of matter of all kinds in their natural or normal condition are at rest, and cohesion is perfectly maintained by the magnetic influence of the atoms on the envelopes of the atoms. A disturbance of any kind on material sets up electrical manifestations; it may at first be exceedingly minute, yet nevertheless it exists. Every operation in building, from the digging of the foundation, the erection of the walls and the covering in of the edifice and equipping of the same, is a disturbance. The mining of the metals that enter into the building is a disturbance; in fact, the making of the different kinds of materials from the raw to the finished stock is a disturbance. Everything that is done about a building or enters into its construction has been disturbed from its primitive rest, and from that moment of disturbance electrical conditions have been set up. The magnetic force of the atoms which induced cohesion have been at that moment displaced by electric conditions destroying cohesion and producing as an ultimate result disintegration and the dissolution of all things.

The atoms of matter in their natural condition which were at rest have by this disturbance been set in motion, and this motion never ceases until dissolution takes place.

The wiring of buildings for electrical purposes, such as heat, light and power, however well insulated, when electrified sets up by a sympathetic action a greater disturbance or agitation of the atoms of the materials and thereby decreases the cohesive force of the atoms, and directly as the electricity in the generator and in the wires is increased, so is by sympathetic action the want of cohesion in the atoms increased. Rest does not restore cohesion once set up; it goes on until complete dissolution takes place. As a result, the greater the electric disturbance the greater the decrease in cohesion in all matter occurs and is inversely as to magnetic condition of the matter.

In regard to the application of what has been said to the introduction of electricity into our buildings, the question naturally arises, Has it any harmful effect upon the materials in the construction? We answer, if our theory is correct, Yes, for by induction in all the materials electric excitation is set up, thereby lessening the cohesive force of the atoms of the

materials, and thereby in course of time disintegration takes place. The greater the conductivity of the materials, such as iron and steel, the quicker the process, and the less the conductivity the slower the process, such as all vitrified matter.

Cannot, if these conditions are found to be, some means be found to obviate or prevent the process of disintegration? Under the ordinary conditions of applied electricity we are not aware of any arrangement to prevent it, and can only at the present time make a few suggestions.

As to buildings of the ordinary kind we have nothing to say. Iron and steel is a small factor in the construction. The system of distributing electricity throughout the same for light and power purposes from our present experience may be correct, and the wires and the insulation of the same may be perfect for this class of buildings only.

What we wish particularly to call your attention to is the new class of buildings, those constructed almost wholly of iron and steel, known as the skeleton-constructed buildings. Under the present practice of wiring buildings no difference is made in the material or methods of doing the work. In the ordinary class the induction plays a very insignificant part, while in the steel-constructed buildings it plays a very important part and should be gotten rid of if possible.

The wires as manufactured and their insulating coverings are good in a general way and may be said to be well insulated, but they are not insulated so as to prevent induction, and this is the great problem. Passing wires through metal conduits increases the induction, while the metal conduits are good against mechanical injury to the wires and to accessibility, and on the other hand are bad on account of induction. A vitrified covering seems to offer the best protection both as to non-conductibility and induction.

The columns and posts of iron or steel in the skeleton construction are almost always insulated from the ground by reason of the piers of stone, concrete or brick on which they are built. We think they should have a complete ground connection by means of heavy copper wires, also at all contact places between metals they should be perfectly clean and free from paint of an insulating character, and all isolated structural parts of the frame of steel should be connected by wiring to the main part, thereby forming a connected and continued system of the iron and steel parts, that the same way be well grounded. By this means we think the vibratory forces will at least be reduced to a minimum.

We would suggest that the wiring throughout the building should be done by one firm only, thereby avoiding confusion in the system.

We offer what we have said merely as suggestions; facts can only be brought out by experiment and practice.

This subject of electrical currents on materials in buildings is one of the greatest interest to the profession, and when well investigated will prove to be a very destructive agent, particularly on iron and steel, and may be the primary cause of many accidents that have occurred in the failure of structural pieces in the skeleton construction.

In conclusion we thank you for your attention and ask of you to investigate this subject thoroughly for yourselves, for at this time it is one of the greatest importance as an applied science to the profession; apart from that the study is exceedingly interesting.

GLASGOW INSTITUTE OF ARCHITECTS.

THE newly-elected council of this Institute held their first meeting on the 3rd inst., in the chambers of the secretary (Mr. C. J. MacLean, 115 St. Vincent Street), under the chairmanship of Mr. David Barclay, vice-president. The following office-bearers were elected, viz.:—President, Mr. John James Burnet; vice-president, Mr. David Barclay; hon. treasurer, Mr. Alex. Petrie; auditor, Mr. Campbell Douglas; secretary, Mr. C. J. MacLean. Some reference was made to the work of the past year, and it was stated that the joint occupation of the rooms at 187 Pitt Street by the Institute and the Architectural Association had continued to be of benefit to both societies. Special attention was directed to the fact that no less than nineteen new standard works on architecture had been added by purchase to the joint library. In addition to these, several gifts of valuable architectural books had been received. Reference was also made to the success of the Metalwork Exhibition which had been held during the past session; to the satisfactory results of the educational work done by the Institute during the past year, and to the exhibition of prize drawings of the Royal Institute held in the rooms last April. It was stated that a conference had now taken place between the committee of the council, that had been invited to meet with the Glasgow Corporation regarding the designs for a proposed public hall at Springburn, and that the suggestions of the Institute representatives had been freely adopted by them.

NOTES AND COMMENTS.

THE sum assigned to the Paris Exhibition of 1900 is 100,000,000 francs, the largest amount of money yet applied to such a purpose. The greater part will, of course, be expended on works of construction. The two palaces devoted to art which are in progress in the Champs-Élysées are expected to cost 21,000,000 francs. The large palace in the Champ-de-Mars will require 18,000,000 francs, the buildings on the esplanade of the Invalides 5,000,000, and the small buildings along the quays 1,600,000 francs. Bridges and other communications across the Seine, including the Pont Alexandre III., are put down for 5,000,000 francs, while the works for utilising the river will cost 3,000,000. It is estimated that mechanical and electric power will need 6,750,000. The circular railway is to cost 1,500,000 francs. Contractors will consequently obtain about 62,000,000 for architectural and engineering works. Lighting the buildings and grounds is estimated at 800,000 francs, the fountains will take 1,200,000 francs, and gardening and plantations 1,500,000 francs. The large sum of 5,500,000 is appropriated to fêtes and competitions. For the organisation of retrospective exhibitions 1,500,000 francs is reserved, and for music 1,000,000 francs. The expenses of juries and rewards to exhibitors will also amount to 1,000,000 francs, and a sum of 400,000 francs is set aside for the benefit of workmen who exhibit. So far the estimates reach 73,000,000 francs. In addition, the working expenses will cost 12,000,000 francs, and administration 8,000,000 francs. There is consequently left a sum of 7,000,000 francs as a reserve to meet contingencies. After such sums the outlay on the Great Exhibition of 1851 appears a trifle, for it amounted to about 350,000. But it produced a profit of nearly 50 per cent., and the most sanguine Frenchman dare not hope to see such a return from the mammoth show of 1900.

THERE is the usual difference in the reports of the examiners who officiated for the City and Guilds of London Institute in June. In carpentry and joinery the results are said to prove that the general education of the candidates has not kept pace with their technical education. Considerable improvement in drawing was shown, but there was a striking deficiency of candidates who were qualified to be placed in the first class. There was a high general level obtained in the practical work for the honours grade. The general character of the answers in brickwork and masonry was satisfactory, but some difficulty was found in comparing the results owing to variations in local practice due to the different classes of material. The examiner for plasterers' work said that he did not find anything in the honours grade of sufficient merit to justify him in recommending the award of a first or second prize. He was also surprised to find so little interest taken in sgraffito and other methods of decoration. In the ordinary grade several good papers were prepared. The papers on painters and decorators' work are described as an improvement on those of last year, but if considered as a whole they are weakest "where they touch upon the reasons for using the different materials employed in painting." According to the examiners for woodwork, "the practical work of the candidates taking the first year's examination may be classed as good, as a whole, while that of the candidates in the final examination can only be described as fairly good. The more general faults were inability to read working drawings, and as a consequence inaccuracy in setting out and failure to work to the measurements given." The answers in metal-work by first year students is said to be above the average, all the students obtaining a sufficient number of marks to enable them to pass, and in the final examination only two students failed.

THE subject selected for this year's Rhind lectures on archaeology, which are delivered in Edinburgh, is "The evidence for a Roman occupation of North Britain." It recalls JONATHAN OLDBUCK's "Essay upon Castrametation, with some particular Remarks upon the Vestiges of Ancient Fortifications lately discovered by the Author at the Kaim of Kinprunes," and the famous Prætorium which EDIE OCHILTREE aided in constructing. The lecturer is Dr. JAMES MACDONALD. The efforts of the Germans, who

recently sent two military officers to Scotland to trace remains of Roman fortified lines, must have had much to do with the choice of the subject. Dr. MACDONALD in his first lecture said that the evidence naturally fell under two heads—the literary or historical and the archaeological. The first literary witness to be called was the historian TACITUS, the merits as well as the defects of whose life of AGRICOLA were pointed out. In the course of his northern campaigns AGRICOLA advanced beyond the Forth and Clyde isthmus, finishing them A.D. 84 on the battlefield of Mons Grampius, the position of which is uncertain. The Emperor HADRIAN on his visit to Britain fixed the northern boundary of the province by raising a barrier along the neck of land which separates the Solway Firth from the mouth of the Tyne. The reign of his successor ANTONINUS PIUS saw the Roman army again on the upper isthmus, and the erection there about 141 or 142 of a second vallum or wall by LOLLIVS URBICUS, then Governor of Britain. With reference to the geography of CLAUDIUS PTOLEMY, the lecturer said that PTOLEMY's information regarding North Britain, though wonderfully correct, appeared to have been drawn from some unknown source or sources. A comparison of his lists of place and other names in what is now Scotland with those found in the classical writers threw doubt on the general belief that he was indebted for all of them to Roman authorities. Relief was thus obtained from the hopeless task of seeking to connect more than a very few with those to be found in the classical writers.

THE ruins of the Cour des Comptes in Paris will be replaced by a railway station, but the Union Centrale des Arts Décoratifs will look on the transformation with equanimity. At one time the Union was supposed to be endowed with the ruins, but could not gain enough fortitude to sign the documents by which possession was accepted. The members now believe the hesitation on that occasion was a sort of inspiration, for in 1900 they believe their collections will be installed in no less a domicile than the Pavillon de Marsan, which is a part of the Louvre. The adaptation of the building is to be entrusted to M. REDON, and as it is expected to cost about 1,500,000 francs, we may assume that splendour is sought. But as the Union has hitherto failed to realise the intentions of its guides, Parisians are likely to be sceptical about the probability of gaining another museum until they can see the collections in their places.

THE French Société Nationale des Beaux-Arts, as is well known, is the result of dissension in the Société des Artistes Français, and it is to be feared that the spirit which originated the Society is not entirely extinct. Another split has occurred, and there is more reason for it than appeared to impel the original founders. The Société Nationale has hitherto exhibited in the Champ-de-Mars. But as the building used has to make way for the buildings of the International exhibition, it was decided to construct new galleries in the Bois de Boulogne. The Council gave the commission to M. FORMIGÉ, the architect, who belongs to the rival Society. It is natural that all the architect members of the Société Nationale should feel aggrieved at the choice, and they at once sent in their resignation to M. PUVIS DE CHAVANNES, the president, and it has been accepted. It is now doubtful whether the building will be erected on the proposed site, as there is much opposition to the scheme in the Municipal Council, on the ground that the galleries would change the character of the Bois.

CHICHESTER CATHEDRAL.

IN the *Chichester Diocesan Gazette* is the following remarkable article on the north-west tower of the cathedral, which it will be observed proposes an innovation without furnishing the name of any architect to sanction the operations:—

The North-West Tower of the Cathedral.

We give an illustration showing the work proposed to be done at the west front of the cathedral, for the first section of which the contract has just been signed.

In explanation of the design we would first ask our readers to look at the northern tower about 32 feet from the ground line. They will there find the word "old"; and this indicates that the old work to the south of the line indicated by an arrow will be left undisturbed; and the ancient buttress to be preserved reaches, as will be seen, to the middle of the upper window where the word "old" again occurs, 72 feet from the base. It is of the first importance to notice this detail, as the preservation of this buttress intact is essential to the safety of the vaulting of the nave. The design for the remainder of the new tower, as will be seen, does not differ greatly from that of the one still standing. Some will probably prefer the old tower and some the new; but into this controversy we do not propose to enter.

The contract now signed is for the first 46 feet; and by using the scale at the foot of the drawing it will be seen that this part of the work will extend nearly to the centre of the second window. It would obviously be undesirable to end there; but funds have already been contributed since the appeal was issued sufficient to bring the work up to the string-course above the second and below the upper windows.

The first section is by the contract to be completed within twelve months from the present date, and the further portion, to which we have just referred, may also be expected to be completed before the end of 1898. By that time it may be hoped that the remaining 2,500*l.* required will have been raised, for it will be admitted by even those with whom the tower is not in favour that, if began, it would be most unfortunate if it were left unfinished.

It should also be remembered that if the work is not carried on continuously, and the contractor has to remove his plant and bring it back again when the final order is given, this will entail a further expenditure of 250*l.*, and this would be a dead loss, for which there would be nothing to show.

It will not be disputed that the tower will render the vaulting of the nave of the cathedral more secure or that the interior of the building at its north-west corner will be greatly improved, and on these grounds alone the tower has a strong claim on the liberality of Churchmen. We hope therefore that an united effort may be made to raise the necessary funds, and now that a beginning has actually been made the work may be carried on to its completion.

The Secretary to the Society for the Protection of Ancient Buildings, in a letter to the *Times*, says:—

The committee of the Society for the Protection of Ancient Buildings desires that you will kindly give it the opportunity

of making it known to all lovers of Mediaeval architecture that a new north-western tower is to be added to Chichester Cathedral.

In calling attention to this after a contract has been entered into, we would explain that we had not contemplated the possibility of the Dean and Chapter going forward before larger funds were at their disposal.

In 1892 the late surveyor to the cathedral made a long and detailed report, stating what repairs the cathedral church needed, and among other necessary repairs was included strengthening the western bay of the nave. Shortly afterwards it was suggested that a new north-west tower should be built. But very little has appeared in the public press upon the subject except a letter signed "A Sussex Churchman," strongly opposing the scheme, which appeared in the *Times* of September 14, 1897, and elicited no answer.

Our society has now received a copy of the *Chichester Diocesan Gazette* for this month, which contains a drawing of the proposed new tower without any architect's name attached to it. It is to all intent a copy of the existing south-west tower. There is also an article stating that a contract has been entered into for building the first 46 feet of this new tower, which is about half the proposed height.

The south wall will be formed by adding to the height of the western bay of the ancient north arcade of the nave, and its eastern wall by carrying up the western wall of the north aisle of the nave.

It is the opinion of three architects from this society who visited the church recently that the ancient work could, without risk, be repaired and secured, but that to incorporate it into a useless new tower and make it carry additional weight would be unreasonable and dangerous. It must not be forgotten that the magnificent campanile stands within a few yards of the site of the proposed sham Norman tower.

The question therefore arises, Is it desirable to risk the sacrifice of the ancient work—a beautiful example of Norman architecture—for the sake of an imitative tower?

We gather from the drawing referred to that as parts are marked "old" it is suggested that the unknown architect might retain the existing work and build on to it; but it must be pointed out that a common procedure in these cases is to begin on some pretext, and then to put forth supplementary reports saying that the work proves to be so dangerous that, notwithstanding the architect's best intentions, it must be entirely rebuilt.

My committee wishes the alternate proposals for dealing with this angle of the building to be clearly understood.

On the one hand a scheme of repair which they have only just laid before the Dean and Chapter could be carried out without danger or the addition of any imitative work, and large sums of money might be saved towards the general repairs which, according to the cathedral surveyor, are so sorely needed.

On the other hand, these needful repairs may still be neglected and the money spent in a brand new and worthless tower, the attempt to erect which may lead to a large destruction of the original work of the twelfth century.

It must further be pointed out that it was the avowed scheme two or three years since to build this modern tower as a preparation for a spire, and also to add a new spire to the south tower, thus risking the safety of that tower also by the additional weight, and smothering the lovely old work in modern trivialities.

We hope that the opinion of the public will yet lead the authorities to give up their destructive scheme.

On Tuesday, at the Mayor's banquet, the Bishop of Chichester, in his speech, said he could assure the Mayor that in the restoration of the north-west tower of the cathedral the building was not going to be ill-treated, as some people suggested, that a sham tower was not going to be erected, that an unknown architect was not being employed, and that, in fact, they knew what they were about with regard to the sham Norman tower which some people seemed to think they were going to build. He might ask the question whether after the spire of the cathedral fell down, it was a sham spire they built up? Then again, when the north-west tower was built by Bishop Seffrid in the thirteenth century, was it a sham tower? Just what Bishop Seffrid did then, the men in this century were going to do now under direction of one of the most eminent architects of the day. That part of the building was not sufficiently strong at present to bear the north-west end of the cathedral, and unless something was done there would be danger through that end of the building pressing on the space. If it would add to the Mayor's contentment and repose at night, he was glad to tell him they were not going to do anything which could be characterised as an act of vandalism, but intended to restore, as far as they could, line for line and stone for stone the work which Bishop Seffrid did in the thirteenth century.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. Hampden W. Pratt, president, in the chair.

The minutes of the last meeting having been read and confirmed, the following gentlemen were elected members:—Messrs. F. G. May, E. O. Payne, W. S. Payne, E. P. Archer, A. C. Stair, C. C. Duggan, R. C. Fry, J. Haslam, C. F. Innocent, E. H. Kent, J. H. Pearson, C. E. Pease, C. M. Quilter and E. R. Taylor. Mr. N. L. Ashburner was reinstated a member of the Association.

The Chairman announced that a *conversazione* would be held at 8 P.M. on November 26 in the *Matinée Theatre*, late St. George's Hall, Langham Place, W. At 8.45 a farce by Mr. F. D. Clapham will be played, entitled "The Broken Contract, or an Egyptian Enigma."

Mr. S. Flint Clarkson read

A Proposal for Classifying Builder's Work.

The proposal is that classes, such as fair (A), good (B), best (C), shall be agreed upon. The committee, realising that I need not be lengthy, thought part of the evening would be sufficient; I hope that we may see our way to rapid progress. The proposal is made in the interest of employers, architects and contractors. It will probably be about equally serviceable to all, as long as contract amounts are settled by competition tendering. Other systems besides competition may be tried with advantage; but at present the greater part of the work is allotted in that method, which seems likely to be kept to also in the immediate future. Drawings, specifications, quantities, competitive examinations, clerks of works and other superintendence, and 5 per cent. are the recognised machinery by which an employer gets exactly what he ought to wish for, and is assured that he is to pay no more than the market price for it. We propose only a minor improvement in the regular machinery. Let us see why it is desirable.

Gradation in quality is as legitimate in builders' work as it is in anything. People know this very well, though they may grumble when gradation takes too wide a range. Proportion is not simply securing the right relation of function and apparent importance. Thorough proportion requires that materials and workmanship shall be varied judiciously by the architect in different buildings and in different parts of the same building. Blunders and wild tendering will account for anything, but there will be smiles, and notes of admiration also, for less outrageous disparities, which might often be traced to misapprehension as to the class of work required. Between work of the highest class and fair work without pretension to excellence there is a wide distance. From work ranking with the best of all time we reach by proper stages the most ordinary work, sound and serviceable, though wanting in fineness of quality and finish, and thence the déclassés may be reached, found in building as in life. Certain contractors lay themselves out for work of a certain kind, selecting workpeople and materials accordingly, and anything out of the usual course meets with less cordial welcome, and is sometimes not competed for with eagerness. The selection of such imperfectly sympathetic contractors accounts for other bad tenders, as also the selection of people who differ a good deal in the class of their business. Classification of work will not help us over all difficulties, but it may be of service in many.

Any decent names of classes will prove better than any others as soon as they are generally accepted. Naming of sub-classes would cause little trouble; every one could do it for himself, or definitions might be agreed upon from time to time, and then used in general practice. There are good precedents. Ships sort themselves into classes. "Best best best" is in general use. There are degrees of merit in timber and other trades; it is, in fact, difficult to find a trade which does not supply precedents. "The Act to facilitate the granting of certain leases" (8 & 9 Vict. c. 124) has supplied for over fifty years specimens of concise forms having much meaning. Fair, good, best; classes 1, 2, 3; ordinary, average, superior; and many other words or forms may suggest themselves, doubtless all with show of reason. There must naturally be two extremes and a mean. The worst work with which an architect could be connected would be at one end, first-rate monumental work at the other, and something better than the one and less excellent than the other between. Let us try:—

Class A.—Nothing special anywhere; the most current things in all trades.

Class B.—Something below the best; special design, adaptation, &c., in the more important parts of the building; good execution, but a keen regard for cost.

Class C.—Excellence in materials and execution; the most finished work of the time; for the best public and private buildings.

Objectors will hint that some contractors might try to supply the least costly work of its class—in fact, the worst work which the architect would pass—instead of what was intended; but the same sort of contractors do that sort of thing now. It will also be suggested that general specifications are not effective,

and that classification might be interpreted by some architects as an encouragement to undue brevity. "The building is to belong to Class B, and is to be completed in all respects accordingly," is the pithiness which is feared; but the passion for detail will keep most architects on the old lines. Old friends in new clothing always come to the front to hinder changes; but this brave self-devotion does not entitle them to special mention.

Hurried, slovenly, and generally inferior specifications (and drawings) should not increase in number, as they are serious evils; but it does not follow that anything which might prevent an inferior specification from failing hopelessly would necessarily be an evil. Hopeless failure results when everything proves adverse; but purses pleasantly full, well-occupied lives and a healthy appetite for compromise, enable many meagre specifications to keep their virtue. Sometimes they are even (in retrospect) looked upon as blessings in disguise. Some employers appreciate low tenders; the architect who has obtained so much for so little is spoken of as skilful and economical; and the contractor, if treated with judicious liberality, does not object to pose as a benefactor who works more cheaply than other people. Contractors are sometimes informed, in suitable language, that they are not to add a large sum per page of specification to their tenders because the specification seems unusually big, and so much per drawing also, because some of the detail drawings, which will form part of the contract, have been prepared in good time instead of later on. Shrewd employers have the same thing in view when they ask whether a specification of 150 pages is really necessary, and hint that explanations about moderation in quality to the builders submitting tenders should be very precise. The mention of a recognised class of work at the beginning of a specification need not lead to the omission of a word from the most thorough specification. The proposed prefatory words would, however, throw a strong light upon every detail.

There are pieces of work which fall to every one of us where time is so all-important that delay of a few days in starting the work may lead to serious reflections on the energy and resource of the architect. These are, happily, exceptional cases, though apparently on the increase, and should not influence ordinary practice conducted under better conditions. But an architect thus pressed for time, after describing all special items and throwing the rest of the work into one of the proposed classes, might feel solid ground under his feet in carrying through a contract.

The classification would frequently be in effect a record of the result of negotiations, such a record as ought to be in writing, in view of the uncertain future—for general understandings are frequently misunderstood, memory fails, or ill-will and bad blood distort it, and much else; or parties die and give no sign. A specification may call in conventional terms for the best materials and labour of their respective kinds, and describe the respective kinds, and still leave a good deal to the discretion of the architect. People who can get on with very imperfect specifications manage to struggle through with more perfect ones. Difficulties arise when a contractor tries to supply a good deal less, and an employer, at the same time, asks for a good deal more than the discreet architect considers that the contract provides. The employer who anxiously suggested explanations to the contractors as to a moderate sum and a good deal of work for it, may find that events before the contract was signed, after a busy interval, become more and more shadowy. He then prayed, as a favour, for mediocre work; now he and his friends read the specification with much care, and interpret conventional phrases literally and liberally—and there is perhaps assistance for them from legal minds. If the contract made it quite clear that work of Class A was intended, such an employer might be disposed to leave things alone. An architect selected because he has a reputation for thoroughness and work of high quality; an appeal by the employer for the mildest treatment such a reputation will permit; resolute bargaining and a low contract sum; and in the sequel a tender solicitude for the keeping up of the architect's reputation, might thus, in the future, be treated by a playwright as one of the dramatic situations possible only in the elder days.

It happens too frequently that Fate rewards a fair-minded architect with more than adequate retribution for other people's faults. The same post may bring him remonstrances both from contractors and employers. One contractor cannot find in the one-eighth scale drawings several mouldings for which he has received full sizes; another finds too many check grooves and tongues in the joinery and unlooked-for stoolings in stonework; another suggests vigorous reductions (or extras), and something nearer a freeman's liberty as to materials. Employers, on the other hand, say their say. Pleasant-minded architects have remarked that, if there is an ambient atmosphere of imperfect satisfaction while the works are in progress, there will not be very much cause for grumbling at the end. But would not things go more smoothly in many cases if everybody had the help of the proposed classification?

It should be added that no minor change will prove a panacea for all building ills. A trial of classification is only a modest little practical proposal. It could be easily introduced, and should be generally accepted in a short time.

The Chairman, opening the discussion, said the matter at first sight appeared to be a simple one, but the more they went into the question the more difficult it became. It would not always be easy to say that the building one was going to erect should belong to one special class, and even if they could the builder might raise an objection to the job if it was to be of a poor class. He did not quite see how the arrangement would work, and it was therefore more a question for builders to discuss. As architects they had always to see that the materials used were of the best kind.

Mr. W. H. Seth-Smith said that as two-thirds of the cost of the building was workmanship, this was a point on which the classification must depend. The materials were defined by it. Perhaps it would be of more value between architects and clients than between builder and client. The client could thus be told that certain expensive materials which he wished to have in the building could not be used. Although interesting, the subject seemed impracticable.

Mr. H. J. Leaning disagreed with the conclusions in the paper. He thought, too, it would have been better if the proposal had been in the form of a resolution rather than as a paper; evidence might then have been obtained as to the feelings of the profession on this important question. The subject was an undercurrent, as it were, in an architect's life. The architect felt that, do what he might, he could not always get what he wanted, and yet he could not reject everything in a contract, whereas the builder seemed to look forward to and expected some advantage, therefore architects felt some reluctance in getting the last penny from him. Restrictions and obligations were relaxed and in the case of a job not of the highest class there was still more leniency. The quality of a building was determined, apart from any questions of plan or design, (1) by the fitness and efficiency of the various parts, which were determined entirely by the specification and drawings, (2) by the quality of the materials used and the style and finish of the workmanship. There seemed to be a confusion of ideas in Mr. Clarkson's definitions. He said class B, special design, adaptations, &c. Did this mean that the builder was tendering from one-eighth scale drawings, and that he must allow for some special mouldings and architectural efforts which came in the first category, although not shown or specified, or did it mean that for the class of buildings in which such things are to be found, class B is the most suitable? Class C reverted to the second category, and read "Excellence in materials and execution." Therefore the classification could only be made to apply to the quality of materials and workmanship, and not to the drawings and details. The latter were dealt with by the quantities, and if varied would be adjusted. Mr. Clarkson did not mention quantities, but alluded to contractors tendering at so much per detail and so much per page of specification. The speculating builder was able to produce a house for so much less than the architect largely by economies effected in the first category, such as thinner inner walls, omission of roof-boarding and felt, use of zinc instead of lead, &c. This was quite distinct from any general saving in quality of materials and workmanship, and was capable of clear and easy definition by drawings and specification. Even so in the second category. The speculating builder saved by the use of inferior bricks, employment of promoted labourers to build, payment by piecework, which meant the minimum of labour everywhere; use of stale lime, foreign steel, light lead pipes, &c. But here as regarded materials the architect was able, without much trouble, to bind the builder hand and foot. The maker of his facing bricks could be specified, as also the lime and cement, quality of sand, and whence to be obtained. The classification would be very well if applied to separate articles, but when applied to a collective mass it ceased to have any meaning. If the suggestion had been one for the formation of three or four model specifications it would have been far more useful and of greater service to the average architect.

Mr. H. Lovegrove proposed a vote of thanks to Mr. Clarkson, seconded by Mr. F. J. Osborne Smith. Mr. Douglas and Mr. Max Clarke also took part in the discussion.

In returning thanks, Mr. Clarkson said many of the remarks were valuable, although they did not come as a revelation to him. He was disappointed to find that more people did not find it desirable.

Mr. H. D. Searles-Wood then read his paper on

Some New Building Materials.

The two materials that I propose to deal with to-night are asbestic and petrified. I do not pretend to have any experience in the use of either, but they having come under my notice, and striking me as of very great importance, I thought that the members of this Association might like to have their attention called to them.

Mr. Harbott, the secretary of the Asbestic Company, is here to answer any question relative to that material, and Mr. G. F. Seddon, the engineer to the Petrified Company, will explain what the possibilities of petrified are.

Asbestic comes to this country from Lower Canada, and is a name given to a by-product from the manufacture of asbestos from serpentine. After the fine white fibrous asbestos has been extracted by machinery, this sand is left, and it is the various uses to which this can be put that I propose to call your attention. Large quantities of this material have recently been used in the United States and Canada in the form of plaster.

It is claimed for plaster made with ordinary lime and asbestic (the proportion recommended being 3 cwt. of lime to 1 ton of asbestic) that it is absolutely fireproof, and being fibrous and possessing very great elasticity, there is no cracking, chipping or crumbling away, and nails driven into it enter in the same way as into a pine board, and can be easily withdrawn. This plaster is also a perfect non-conductor of heat, and rooms plastered with this substance keep an even temperature much longer than rooms plastered with other materials. It is stated that this plaster, being a perfect non-conductor of sound, has a curious effect on the room or hall where it is used, making them much easier for singing or speaking in.

For the protection of metals this substance has a great future. An elaborate series of experiments were carried out by General Povey Smith, when he found that asbestic not only protected the metal against fire, but at the same time preserved it from any corrosion.

The covering properties of the asbestic plaster are about 40 per cent. more than those of ordinary plaster, and it is 40 per cent. lighter to handle; the mixing and application are so much easier that there is a saving of 25 per cent. in actual labour.

The directions for use are given as under:—For rough coat: Slack about 3 cwt. of lime, and while liquid run it through a sieve into a box large enough to hold one ton of asbestic. Mix thoroughly, adding the requisite amount of water. After the lime and asbestic are thoroughly mixed, the plaster should be allowed to stand at least twenty-four hours before being used.

For finishing coat: Mix two parts of lime to one of asbestic finish, and gauge with plaster-of-Paris.

No hair or sand is required.

The price of the asbestic, per ton of 2,240 lbs., is 3*l*.; asbestic finish, 5*l*.

The sole agents for London are Messrs. Witty & Wyatt, of 88 Leadenhall Street, E.C., where numerous samples can be seen.

The foregoing information I have obtained from the trade circular.

The plaster takes about three weeks in setting to get thoroughly hard, and it gradually toughens after that time.

The asbestic is now being made up in slabs about $\frac{1}{4}$ inch thick; these can be worked as easily as wood, and as non-conductors of heat and cold they can be utilised for walls, ceilings, cornices, mosaics, &c., and can be used out of doors and coloured as required. In hot climates it will resist the attacks of the termite or white ant. A bungalow constructed with an outer and inner skin of this material and a confined air-space between would have a low temperature in the hottest weather. It can be moulded to any shape and fixed in position by nails, screws or cement. This material is far more suitable for buildings in new countries such as Africa or West Australia than corrugated iron or Hessian (that is, canvas and framing that does duty for walling in many of the new townships in those countries). A friend of mine who has just returned from West Australia particularly complained of the discomfort of the Hessian built hotels. Picture to yourselves an hotel constructed entirely of canvas in which there were five bars, and all of them filled with miners, whose panacea for every ill is whisky. The non-conducting property of asbestic plaster would in this building be of great value.

In America and Canada asbestic roofing is largely used; it forms a light roofing material that is absolutely incombustible, and being a non-conductor, keeps the building of an even temperature.

For hot countries glazed asbestic tiles are being made for roofing purposes.

In the manufacture of paper asbestic is being largely used. Paper 130 inches in width is being produced in one factory for building purposes. Asbestic has been recently selected by the London County Council as one of the fireproof materials that may be used in the alterations at Olympia.

Talking over the subject of this paper with Mr. Drew, when we were at Furness Abbey, I asked him what new material in his opinion was most wanted. He replied, "An artificial slate." By the kindness of the proprietors of the two materials I am describing to-night, I have made some artificial slates which I think will meet this want. The samples were only made yesterday and so are not yet fit for experiments, and the surface is smoother than I intended; but I think that they show that a good roof covering can be made in this way. They would be light, non-combustible and non-conducting. These

samples are self-coloured and are a dark grey, but they could be made to any shade of colour.

Petrifite is a white cement which appears to have the power of binding together almost any material that can be thought of. The principle of the invention was discovered in 1891, but it was not until some years later that a cheap and practical method of making petrifite was worked out and patented, and even now it is not practically on the market, though I am informed that it is hoped it may be by the 15th of this month.

During the lapse of time from its discovery a large series of exhaustive and interesting experiments have been made, and some wonderful results obtained.

Messrs. David Kirkaldy & Son have reported on the following experiments:—

	Result.
25 per cent. Portland cement and clean pit mud, petrifite and ordinary sea sand	Petrifite eleven times the strength.
Petrifite and common earth	Nearly four times the strength.
Natural Bath stone: 10 per cent. petrifite and ordinary sea sand.	Nearly twice as strong.
Natural Portland stone: 25 per cent. petrifite and ordinary sea sand	Stronger when only thirty days old.
Marble Carrara blocks: 50 per cent. dust from the same with petrifite	8 per cent. stronger.
Tensile strength: 25 per cent. Portland cement and clean pit mud, 25 per cent. petrifite and clean pit mud	Over five times as strong.
Tensile strength: 25 per cent. petrifite, sea mud and powdered chalk	Over seven times as strong.
Porosity: 25 per cent. Portland cement and clean pit mud, 25 per cent. petrifite cement and clean sea sand	Nine times less porous.

In a further report made by Messrs. Kirkaldy in May 1897, as to the effect of immersion in water, it was found to reduce the ordinary petrifite 25 per cent. in strength, as against 10 per cent. in natural Portland stone and 20 per cent. in natural Bath stone; but samples made with hydraulic petrifite, which is ordinary petrifite mixed with from 5 to 10 per cent. of inexpensive materials, the diminution in strength is slight.

As regards hardness of surface and hardness internally, there is hardly any appreciable difference between 2 to 1 Portland and 6 to 1 or 9 to 1 petrifite.

A backing of 6 to 1 petrifite, faced with 3 parts plaster of Paris to 1 of petrifite, yields a hard and smooth surface very suitable for walls.

The tests made to ascertain the relative adherence of petrifite mortar show that 6 of sand to 1 of petrifite adheres as well to the face of rough bricks as good Portland cement mortar mixed 3 to 1. In the case of bricks with rather smooth surfaces, petrifite mortar gave nearly four times the adhesive strength.

Petrifite mortar mixed 3 to 1 with smooth bricks had ten times the adhesive strength of the same proportion of Portland cement mortar. Another feature of petrifite is that it adheres to wood.

Messrs. Kirkaldy summarise their two reports by stating that petrifite has the following valuable properties:—

1. Its combinations have great crushing and tensile strength and adhesive qualities.
2. It will solidify unclean materials, the presence of which, even in small quantities, would be fatal to the setting of Portland and other cements, and bind together into useful blocks many substances which cannot now be utilised.
3. Dirty or unwashed materials can be used, which is not the case with other cements.
4. Its compounds do not sweat or effloresce, thus enabling sea sand to be used.
5. It will adhere perfectly to wood or iron.
6. As ordinarily used it solidifies slowly, so that work need not be hurried; it then dries and sets hard with great rapidity.
7. It is so powerful that a much smaller quantity suffices, considerably reducing the cost of freight and transport.
8. After setting has commenced, it can be still used again, as but little deterioration takes place, unlike other cements, when small quantities have to be mixed for immediate use.
9. It does not become inert after exposure to a damp atmosphere.
10. It may be used when quite freshly made, without fear of failure.

Messrs. Slunger & Blount's report states that petrifite, when mixed with a suitable aggregate, *e.g.*, sand, expands on setting to about the same extent as Portland cement. This expansion is not likely to be perceptible in ordinary use.

Mr. G. F. Harris, stone and quarry expert, summarises his very interesting report on petrifite sandstone, that the Petrifite Company can deliver a first-class dressed building stone in London at a price under half that of dressed natural building stone, and of a superior quality.

As a plaster, petrifite has been reported on by Mr. Marson. Its advantages over Portland cement are that it can be used

with sea sand without risk of efflorescence, and the surface is harder and closer than when Thames mud is used. Thus the labour of screening and washing the mud is saved. Petrifite grips the whole surface, both smooth and rough places, and being "fatter" than Portland cement can be laid more easily, and does better. Compared with Keene's cement, it has the advantage of being non-porous, much harder when set and can be worked much more quickly. If petrifite compounds are painted whilst wet the paint sinks into the soft material. It takes no longer to dry than ordinary paint put on woodwork. In twenty-four hours a room can be finished and ready for occupation. With colouring matter, petrifite and water is a first-class substitute for ordinary distemper. In moulding all difficulty of allowance for contraction is avoided, and for making the moulds for casting repeats petrifite mixed with plaster of Paris or sand is a perfect material.

Plaster slabs made of petrifite are much stronger than the ordinary slabs, which are going out of use, as they are not strong enough, although of great convenience.

As a cement for iron an ordinary galvanised iron building can be covered with petrifite plaster and it will adhere perfectly.

Petrifite has one special quality, viz. that the water which is added does not evaporate but enters into a chemical union with the cement. The hardening process takes a very short time; it may be delayed by cold weather, which has a bad effect on all other cements and lime, but the setting is not stopped. A wall coated with petrifite mortar will not crack if done in hot weather. Petrifite cement may be used in any climate and at any season of the year.

Used as artificial wood, petrifite mixed with sawdust has the following advantages over ordinary wood.

1. It is one-quarter the price of hard wood.
2. It does not expand or contract as natural wood does.
3. It does not split, nor crash, nor warp.
4. Uninflammable.
5. Free from the ravages of white ants.

Two tables at the works of the company, about 12 feet long by 3 feet broad, made of sawdust are faultless, although they have had rough usage for about three years.

This artificial wood can be cast into any shape or size and can be worked with the same tools as ordinary wood. It also has the advantage that it can be made in large masses, uniform in quality and strength throughout. For flooring it can be made in an unbroken sheet. It can be made as to be easily sawn at any time, or else it can be made as hard as stone and can be coloured to any shade.

Two artificial stones made of sawdust and petrifite have been tested for four years, one as a step outside the main entrance of the Landsberg factory and the other as a flagstone at the entrance gate of a flour mill at Landsberg; both of these stones show little signs of wear although they have had very hard usage.

At the offices of the Petrifite Company, 10 Walbrook, there is a very interesting collection of specimens of a great variety of waste materials, such as road sweepings, ashes and clinkers from the destructors, made into bricks by the City Commissioners of Sewers by being mixed with 25 per cent. of petrifite; and some really beautiful slabs made of waste paper pulp, and some slabs of polished plastic made of marble dust, even the sawdust and petrifite blocks being capable of taking a polish, the grains of wood being so indurated with the petrifite. The sawdust blocks also are practically incombustible. But it is not as an artificial stone, marble or wood that I bring this before you to-night, but as a new material to take up its own ground. And I think that this is the direction in which any discussion might be most usefully turned. Here are two materials of a highly plastic nature, and what is the legitimate treatment for them from an architectural point of view?

Petrifite can be run, moulded or worked by a tool; either moulded and built in the walling in blocks, or run and modelled *in situ*.

Much remains to be done to develop the proper treatment of cement work. Within its own limits, stucco is as legitimate a building material as stone or brick.

The President, Mr. Brodie, Mr. Seth-Smith, Mr. E. H. Sim and Mr. J. D. Matthews offered some remarks on the paper. In reply, Mr. G. F. Seddon recapitulated some of the results of the tests on the strength of petrifite, and which prove its utility for many purposes.

EDINBURGH ARCHITECTURAL SOCIETY

THE thirteenth meeting of the session was held on the 3rd inst., Mr. J. A. Williamson, president, in the chair. Mr. A. N. Paterson, Glasgow, delivered a lecture, entitled "Evolution of the House," which was largely illustrated by diagrams. Mr. Paterson first treated of the earliest developments of domestic dwellings, and then described, in historical order, the houses of the Greeks and Romans, the Saxon hall and Norman castle, the grange and the monastery, the early town house and the mansions of Elizabethan and Jacobean

times. He traced the special Scottish developments from the fifteenth to the seventeenth centuries, and gave a short description of the Palladian type of house, and the house of Queen Anne and the Georges.

ROMAN ORDERS OF ARCHITECTURE.*

VITRUVIUS, one of the earliest writers on this subject, enumerates five orders of architecture, and modern architects have accepted his enumeration and classification. The five orders of architecture which we shall, for the sake of the argument, call the Roman orders of architecture, are named as follows:—Tuscan, Doric, Ionic, Composite and Corinthian, not one of which, except the Composite, originated in Rome. The Tuscan was a native product of Etruria; the Doric, Ionic and the Corinthian, as their names imply, originated in Greece, while the Composite, as its name implies, was a hybrid production being composed of some of the peculiarities belonging to both the Ionic and the Corinthian orders. The Roman architects and artisans in their treatment of the Tuscan and Grecian orders made some important changes in the details, and it is to consider some of these changes that the present paper has been prepared. While we may enter quite largely into a technical explanation of the several parts of these different orders, yet we may have to refer to the architectural history of the centuries, especially that of Etruria, in order to clearly understand our subject.

Another architectural feature quite foreign to the orders of architecture when considered simply as orders, but which enters into and forms an important part in Roman architecture, and is therefore almost inseparably connected with the subject under consideration, is the use of the arch; we cannot well discuss the Roman orders of architecture without also discussing the use of the arch as practised by the ancient Romans.

The ethnographical history of art in Italy, says Fergusson, is in all its essential features similar to that of Greece, though arriving at widely different results from causes the influence of which it is easy to trace. Both are examples of Aryan development based on a Turanian civilisation which it has superseded. In Greece the traces of the earlier people are indistinct and difficult to seize. In Italy their features are drawn with a coarser hand and extend down into a more essentially historic age. It thus happens that we have no doubt as to the existence of the Etruscan people; we know very nearly who they were and cannot be mistaken as to the amount and kind of influence they exerted on the institutions and arts of the Romans.

The earliest inhabitants of Rome were an Aryan or Indo-Germanic race who established themselves in a country previously occupied by Pelasgians. Their principal neighbour on one side was Etruria, a Pelasgian nation. On the other hand was Magna Grecia, which had been colonised in very early ages by Hellenic settlers of a kindred origin. It was therefore impossible that the architecture of the Romans should not be in fact a mixture of the styles of these two peoples.

Throughout the Roman period the two styles remain distinct, and there is no great difficulty in referring almost every feature in Roman architecture to its origin. As a transition order it was only a juxtaposition of both styles, the real fusion taking place several centuries later. The Romans were borrowers of architectural forms, not inventors. From the Greeks they borrowed the rectangular peristylar temple, with its columns and horizontal architraves, though they seldom, if ever, used it in its perfect purity, the cella of the Greek temples not being sufficiently large for their purpose. The principal Etruscan temples were square in plan, and the inner half occupied by one or more cells, to the sides and back of which the portico never extended. The Roman rectangular temple is a mixture of these two; it is generally, like the Greek temples, longer than its breadth, but the colonnade never seems to have entirely surrounded the building. Sometimes it extends on the two sides as well as the front, but more generally the cella occupies the whole of the inner part, though frequently ornamented by a false peristyle of three-quarter columns attached to its walls.

Besides this the Romans borrowed from the Etruscans a circular form of temple unknown to the Greeks, but which to their tomb-building predecessors must have been not only a familiar but a favourite form. A more important characteristic which the Romans borrowed from the Etruscans was the circular arch. It was known, it is true, to the Egyptians, Assyrians and Greeks, yet none of these people, perhaps, excepting the Assyrians, seem to have used it as a feature of their ornamental architecture, but the Etruscans appear to have had a peculiar predilection for it, and from them the Romans adopted it boldly, and introduced it into almost all their build-

ings. It was not at first used in temples of Grecian form, nor even in their peristylar circular ones. In the civil buildings of Rome it was a universal feature, but was generally placed in juxtaposition with the Grecian orders. In the Coliseum, for instance, the whole construction is arched.

The exterior being composed of three orders of architecture, superimposed with columns engaged, and one order with pilasters only, the orders represented in the structure are the Doric, the Ionic and the Corinthian and the upper storey is decorated with Corinthian pilasters. In this instance, at least, the purity of the several orders is not maintained, and Mr. Fergusson characterises the whole as a "useless network of ill-designed and ill-arranged Grecian columns and entablatures." Having briefly alluded to the disposition of the Roman architects to borrow or rather appropriate the architecture of other countries to their own uses, we will now turn to the consideration of the five orders of architecture as practised by the Romans.

The first thing that strikes the student in attempting to classify the numerous examples of Roman architecture is the immense variety of purposes to which it is applied as compared with previous styles.

In Egypt architecture was applied only to palaces, temples and tombs; in Greece it was almost wholly confined to temples and theatres; in Etruria to tombs. It is in Rome that we first feel that we have not to deal with either a theocracy or a kingdom, but with a great people, who for the first time in the world's history rendered architecture subservient to their myriad wants. It thus happens that in Roman cities, in addition to temples, we find theatres and amphitheatres, baths, palaces, tombs, arches of triumph and pillars of victory, gates, bridges and aqueducts all equally objects of architectural skill. The best of these, in fact, are those which from previous neglect in other countries are here stamped with originality. These would have been noble works indeed had it not been that the Romans unsuccessfully applied to them those orders and details of architecture which were intended only to be applied to temples by other nations.

Of the first of the five orders of architecture commonly called the Tuscan, from its supposed origin in ancient Etruria, very little can now be said. The first instructions which the Romans received in the art of building came from Etruria, which probably did not occur before the time of the Tarquins, when their edifices began to be constructed on fixed principles and to receive appropriate decoration. The first Tarquin was a native of Etruria, and during his reign much was done towards the improvement of Rome; solidity of construction was a prominent feature in Etruscan architecture.

Their cities were surrounded by walls consisting of enormous blocks of stone and usually very high. Remains of them are still to be seen at Volterra, Cortona and Fiesole. In the walls of Cortona some of the stones are upwards of 22 Roman feet in length and from five to six feet high, and in them neither clamps nor cement appear to have been employed. The walls of Volterra are built after the same gigantic fashion.

It appears from the foregoing that whatever of stability characterised Roman architecture was borrowed from Etruria, and with it came what is commonly called the Tuscan order.

There are no remains of a complete Tuscan order among the relics of antiquity; the present delineations of the orders being determined by the interpretations which different architects have put upon a passage in Vitruvius in which it is described. As this description is somewhat obscure it is only natural that very different conclusions have been arrived at upon this subject; thus the celebrated Italian architects, Palladio, Vignola and Scamozzi, have each produced a different design and each claiming it to be Tuscan. Although there exists no ancient remains of a perfect Tuscan order, yet there are examples of Tuscan columns, among the more noted of which stands Trajan's column at Rome.

Vitruvius does not speak of this as a distinct order, although he alludes to the construction of Tuscan temples. He makes the column 6 diameters in height with a diminution of one-quarter of a diameter; the base and capital he makes each half a diameter in height. He decides no height for the architrave or cornice, omits the frieze, but places mutules over the architrave which are to project one-fourth of the total height of the column, including base and capital. He does not provide a pedestal.

Palladio makes the total height of the order $9\frac{1}{2}$ diameters, of which he gives 6 to the column, the base and capital each measuring half a diameter. He provides no pedestal, but places the column on a plinth whose height is equal to 1 diameter of the column.

Serlio makes the height of the architrave half a diameter, and gives an equal height to the frieze and cornice. He places the column on a pedestal which consists of a plinth and base, a die and cymatium, the whole being one-third the height of the column.

Scamozzi assigns as the height of the entablature one-fourth of the total height of the column, less half a diameter, and

* A lecture by Mr. Cyrus K. Porter, published in *Stone*.

makes his pedestal the same height. He also places a sort of triglyph in the frieze.

Normand's "Parallels," published 1819, gives the proportions as follows:—Column 7 diameters, entablature $1\frac{3}{4}$ diameter, making the order $8\frac{3}{4}$ diameters in height. Our architects usually make the order 9 diameters high, 7 of which are given to the column, of which 30 minutes are given to the base, 36 to the capital and the remainder to the shaft. The entablature is given 2 diameters, of which the architrave gets 35 minutes, the frieze 40 minutes and the cornice 45 minutes.

All of the mouldings are of a plain and substantial character, have the appearance of great solidity and strength, and the order is eminently qualified for the position usually assigned it by modern architects as the representative of strength and durability.

Aside from the character for strength which the Tuscan possesses to an eminent degree, there is but little reason for regarding it as a separate and distinct order of architecture, for indeed it is little more than a variation of the Roman Doric order, which divested of its enrichments is to all intents and purposes Tuscan. It has, however, secured recognition among architects as an order of architecture, and will no doubt in the future, as in the past, be adopted in situations where great strength and durability are required.

Adopting the usual classification, the next order for us to consider is what is usually termed the Roman Doric. This style takes a place about half-way between the Tuscan wooden posts and the noble simple order of the Greeks. It was no doubt a great improvement on the former, but for monumental purposes greatly inferior to the latter. It was, however, more manageable, and for forums or courtyards, or as a three-quarter column between arcades, it was better adapted than the severe Greek style, which, when so employed, not only loses almost all its beauty, but becomes more unassuming than the Roman.

This fact was apparently recognised, for there is not, so far as known, a single Doric temple throughout the Roman world. It would in consequence be most unfair to institute a comparison between a utilitarian prop used only in civil architecture, and an order which the most refined artists in the world spent all their ingenuity in rendering the most perfect, because it was devoted to the highest religious purposes. The addition of a base made the order much more generally useful, and its adoption brought it much more into harmony with the other two existing orders, which would appear to have been the principal object of its introduction.

The keynote of Roman architecture was the Corinthian order, and as from the necessities of their tall many-storeyed buildings the Romans were forced to use three orders together, often one above the other, it was indispensable that the three should be reduced to something like harmony. This was accordingly done, but at the expense of the Doric order, which, except when used in combination, must be confessed to have very little claim to our admiration.

The Roman Doric is even a ruder imitation of the Grecian original than the mean and tasteless deterioration of the venerated Ionic is of the graceful Athenian examples. The example of it which is considered preferable to others is the Theatre of Marcellus at Rome. In this example the columns are nearly 8 diameters in height; it consists of a shaft and capital only, a portion of the cornice having been destroyed. The height of the entablature cannot be correctly ascertained, but from analogy it may be taken with the bed-mould, part of which exists at about two-thirds of a diameter, making with the architrave and frieze an entablature of about 2 diameters in height. Of this the architrave is exactly half a diameter. Three-tenths of its depth are unequally occupied by the *tænia*, *regula* and *guttæ*, the last of which are six in number, and truncated semi-circles in form.

The rest of the surface of the architrave is plain and vertical, impeding a point within the superior diameter of the column. A fascia one-eighth its own height bands the frieze above the triglyphs; the rest of its surface is plain vertically, but horizontally it is divided into triglyphs half a diameter in width, placed over the centres of the columns. The space between the triglyphs is equal to the height of the frieze without its band and fascia, making in effect perfectly square metopes. All that can be traced of the cornice is a small *cyma-reversa*, immediately over the frieze, and a square member with dentils on it. In the example published the cornice is completed from that of the Doric of the Coliseum.

The temple at Cora presents a singular example of the Doric order, evidently the result of an examination of some Greek examples, but moulded to the Roman proportions and to Roman tastes. The columns are enormously tall, but the shafts are partly fluted and partly chamfered for fluting, like the Greek. The capital is ridiculously shallow, but the abacus is plain and the echinus somewhat of the Hellenic form. The entablature is very little more than a diameter and a third in height, and the architrave of it even shallower than the capital; but the frieze and the cornice are tolerably well proportioned, though the triglyphs are meagre, narrow slips and

the latter is covered by a deep widely projecting cavetto, that would be injurious to even a better composition. Instead of the regular mutules with *guttæ*, the whole of the plancere is studded with the latter; but like the Greek, the triglyph over the angular column extends to the angle of the architrave, which does not appear to have been the practice of the Romans; yet the reason for this does not appear to have been understood, for the external intercolumniations are the same as the others.

As far as we have the means of judging the Romans made the *antæ* of their Doric similar to their columns, only that they were of course square instead of round, though, indeed, an attached column appears to have been preferred.

It is, however, to be remembered that of these two orders the Doric and Ionic of the Roman school ought hardly to be considered as belonging to the architecture of the Romans. They are merely coarse and vulgar adaptations of the Greek originals, of which we now possess records of the finest examples.

(To be continued.)

GLASGOW ARCHITECTURAL ASSOCIATION.

THE usual monthly meeting was held in the rooms, 187 Pitt Street, on Tuesday, 2nd inst., at 8 o'clock P.M., when Mr. James Salmon delivered a paper entitled "Design in Construction." The lecturer divided his paper into two parts—the æsthetic and the practical. In the former he satirised in a racy fashion the common practice of everyday architectural design, where features of old work were selected and strung together either inflated or shrunk down as the case required. The same principle was acted upon in construction, the stock forms of the text-books being reproduced without any consideration of their applicability or attempt at fulfilling the same requirements by independent thought. This state of things Mr. Salmon blamed as the recognised system of stuffing students with dull rule of thumb details instead of endeavouring to direct their minds to grasp the general principles and think independently.

This was demonstrated by showing in drawings and on the blackboard modes other than those generally in use for carrying out a few of the commonest pieces of construction.

DEVON AND EXETER ARCHITECTURAL SOCIETY.

AT the Athenæum, Exeter, the Rev. Oswald J. Reichel, M.A., B.C.L., F.S.A., delivered on Thursday last an exceedingly interesting and able lecture on "Churches and Chapels: their Differences in Objects and Construction." He stated that there is, and always has been, in the use of the term church, applied to buildings, a broad distinction between public churches and private churches. Public churches, or ancient minsters, were those provided with a staff of clergy capable of handing down tradition and exercising public discipline; private churches were praying places for the living or memorial places for the dead. Intermediate between public and private churches were parochial churches, the majority of which were originally private chapels, but were constituted in a certain sense public churches and endowed as such between the eleventh and thirteenth centuries in this country. The chair was taken by the Rev. W. Hope.

TESSERÆ.

Charlatans in Painting.

IN the early years of the present century artists and amateurs were astonished by the proposals of a very young lady, scarce in her teens, for unveiling her Venetian secret and teaching Royal Academicians to colour, at five guineas a head, by which young and old, learned and unlearned, were equally captivated, and Malone was so dazzled as to lament most piteously the great misfortune of Reynolds in being cut off before he had had an opportunity of purchasing her inestimable and cheaply proffered favours. At another time still more wonderful recipes were announced for making Titians and Correggios by a chemical process, or for producing fine pictures without the help of science, genius, taste or industry. Oil, water, varnish, gums, wool, worsted, pokers, chalk, charcoal and brick-dust have had their several advocates. All which might well be laughed at if it had not the mischievous effect of diverting the student's attention from the end to the means, disposing him to the worst kind of idleness and filling his head with a farrago as pernicious and nugatory as the pursuit of the philosopher's stone or the perpetual motion, and as little connected with the real essence of painting as writing with red or

black ink, or upon crown, double elephant or foolscap paper is with that of poetry. Sir Joshua Reynolds seems particularly anxious to guard the young practitioner against such vain pretenders and wonder-mongers, by exposing the danger of his fancying the art to consist of anything like the tricks of a juggler, or imagining that excellence is to be obtained any otherwise than by incessant practice and well-directed study. "Labour," says he, quoting from the ancients, "is the price which the gods have set upon everything truly valuable."

John Glover.

Glover's style of execution in water-colours was hailed as a novelty in art; it excited more astonishment the more it was seen, it was not one of those nine-day wonders that was followed with the blind furor of fashion and soon forgot, it rather excited increasing curiosity and a desire of imitation in a thousand admirers. The apparently careless scramblings of black and grey, the absence of defined forms, the vapourish appearance of the clouds, the mountains and the distances, the distinct unbroken patches of yellow, orange, green, red, brown, &c., which upon close inspection made up the foreground, middle-grounds and off-skip in his compositions, seemed entirely to preclude all necessity for the labour of previous study. Correctness of drawing, carefulness of shadowing, precision of handling, blending of colouring—requisites which had appeared so indispensable heretofore as components of a picture—were by many supposed no longer necessary. The amateur, enraptured at so happy a discovery, no less than that of painting the most beautiful effects of romantic scenery without labour, reflection, science, and with nought but mere dexterity of hand and washing and sponging, set about making huge drawings in the style of Glover; but the secret remained with the inventor of the style and reams of atlas and elephant were used but to prove, although in a different acceptation, the axiom of the sagacious poet, that it requires an extensive knowledge of art indeed to know how "discreetly to blot." The ingenuity of the inventor and the extraordinary dexterity with which he has applied his discovery in depicting the vast range of landscape and marine scenery could not fail to excite the wonder and applause of all admirers of the elegant discoveries of human genius; for certainly the effects produced by Glover in this style of execution, as exhibited in some of his happiest compositions, when viewed at the distance of a few feet from the subject, are as nearly allied to reality as any scenes that ever were imitated by graphic means, by the most accomplished hand, directed by the most observant eye. Who that had not seen this eminent artist at his easel could have supposed the possibility of twisting camel-hair brushes together, spreading them to the apparent destruction of their utility, yet dipping them in jet black Indian ink, or grey, or such tints as suited his purpose, and by a rapid and seemingly adventitious scrambling over the surface of his design, prepare the light and elegant forms of the birch or willow, the graceful sweepings of the branches of trees of larger growth and the vast masses of woods and groves, sparkling in their various foliage, in all the brightness of a morning sun, or under the influence of the solemn repose of evening shade? Yet his works display these effects with exquisite feeling and with a vigour and spirit that no style of art could excel.

Egyptian Obelisks.

It is said by Ammianus Marcellinus "that an obelisk is a very rough stone in the shape of a kind of landmark or boundary stone, rising with a small inclination on all sides to a great height; and in order that it may imitate a solar ray by a gradual diminution of its bulk, it terminates in a prolongation of four faces united in a sharp point. It is very carefully smoothed." Most ancient writers consider obelisks as emblematic of the sun's rays. An obelisk is properly a single block of stone cut into a quadrilateral form, the sides of which diminish gradually but almost imperceptibly from the base to the top of the shaft, but do not terminate in an apex upon the top, which is crowned by a small pyramid, consisting of four sides terminating in a point. The Egyptian obelisks were mostly made of the red granite of Syene, from which place they were carried to the different parts of Egypt. They were generally placed in pairs at the entrance to a temple, and occasionally in the interior, and were usually covered with hieroglyphical inscriptions. Obelisks were first transported to Rome under Augustus, who caused one to be erected in the Circus and another in the Campus Martius. The former was restored in 1589, and is called at present the Flaminian obelisk. Its whole height is about 116 feet, and without the base about 78 feet. The obelisk in the Campus Martius was set up by Augustus as a sundial. It stands at present on the Monte Citorio, where it was placed in 1792. Its whole height is about 110 feet, and without the base about 71 feet. Another obelisk was brought to Rome by Caligula. It stands at present in front of St. Peter's, where it was placed in 1586, and its whole height is about 132 feet, and without the base and modern ornaments at top about 83 feet. But the largest

obelisk at Rome is that which was originally transported from Heliopolis to Alexandria by Constantine, and conveyed to Rome by his son Constantius, who placed it in the Circus Maximus. Its present position is before the north portico of the Lateran church, where it was placed in 1588. Its whole height is about 149 feet, and without the base about 105 feet. There are eight other obelisks at Rome besides those mentioned above, but none of them are of historical importance. There are also obelisks in various other places, as at Constantinople, Arles, Florence, Catania in Sicily, &c., some of which are works of Egyptian art and others only imitations.

The Facial Angle.

It is reasonable to suppose that in endeavouring to form a standard or a canon of proportion for the human figure, the Greeks began with the head, its form, its position, the manner in which it is attached to the trunk. They found that man alone carries his head erect, and that thence he derives a face and a countenance. Of all the brute creation, what is called the head is only an extremity of the horizontal body, whose under parts are shoved forward to seek food or seize prey; front and upper part are driven back, are shortened, and, in more than one genus, hardly perceivable. The more the brute is raised before and erects the neck, the more it gains variety of aspect; still it hangs forward, an appendix to the trunk. It cannot be properly said to have a head; the etymology of the word implies an erect position. A head, strictly speaking, is the prerogative of a man, formed beneath a skull which rounds the forehead and determines the face. The more the front recedes and inclines to the horizontal, so much the nearer a head approaches the form of a brute; the more it inclines to the perpendicular, the more it gains of man. This observation has been demonstrated in the least fallible manner by Camper, the anatomist, who, by a contrivance equally ingenious and unequivocal, appears to have ascertained not only the difference of the *facial* in animals, but that which discriminates nations. Placing the skull or head to be measured into a kind of sash or frame, pierced at equidistant intervals to admit the plummet and horizontal and perpendicular threads, he draws a straight line from the aperture of the ear to the under part of the nose, and another from the utmost projection of the frontal bone to the most prominent part of the upper jaw. The whole is divided into ninety, or even one hundred degrees, from the actual maximum and minimum of nature to those of art. Birds describe the smallest angles, which widen in proportion as the animal approaches the human form; the heads of apes reach from forty-two to fifty degrees, which last approaches man. The negro and Kalmuck reach seventy, the European eighty, the ancient Roman artists ascended to ninety-five, the Greeks raised the ideal from ninety to one hundred degrees. What goes beyond this line becomes portentous; the head appears misshapen, and assumes the appearance of a hydrocephalus. It is the limit set by art and established on this physical principle, that the more the form of the head reclines to the horizontal or overshoots the given perpendicular, the more the maxillæ are protruded or the more the front, the less it retains of the true human form, and degenerates into brute or monster.

Early Fresco Painting.

Fresco was probably little employed by the ancients for works of imitative art, but it appears to have been the ordinary method of simply colouring walls, especially amongst the Romans. The walls were divided into compartments or panels which were termed *abaci*; the composition of the stucco and the method of preparing the walls for painting is described by Vitruvius. They first covered the wall with a layer of ordinary plaster, over which, when dry, were successively added three other layers of a finer quality mixed with sand; above these were placed still three layers of a composition of chalk and marble dust, the upper one being laid on before the under one was quite dry, and each succeeding coat being of a finer quality than the preceding. By this process the different layers were so bound together that the whole mass formed one solid and beautiful slab resembling marble, and was capable of being detached from the wall and transported in a wooden frame to any distance. Vitruvius remarks that the composition of the ancient Greek walls was so excellent that persons were in the habit of cutting away slabs from them and converting them into tables, which had a very beautiful appearance. This colouring *al fresco*, in which the colours were mixed simply in water, as the term implies, was applied when the composition was still wet, and on that account was limited to certain colours, for no colours except earths can be employed in this way that have not already stood the test of fire. Pliny mentions those colours which could not be so employed: *purpurissum*, *indicum*, *caeruleum*, *melinum*, *auripigmentum*, *appianum* and *cerussa*; instead of *melinum* they used *parætonium*, a white from Egypt, which was by the Romans considered the best of whites. The care and skill required to execute a work in fresco and the tedious and expensive process of pre-

paring the walls, must have effectually excluded it from ordinary places. The majority of the walls in Pompeii are in common distemper, but those of the better houses, not only in Pompeii but in Rome and elsewhere, especially those which constitute the grounds of pictures, are in fresco. All the pictures, however, are apparently in distemper of a superior kind, or a guazzo, but the impasto is of various qualities; in some it appears to have the consistency of oil-painting without its defects, in others it is very inferior. Ordinary distemper, that is, with glue or size, is probably the most ancient species of painting; many of the ancient ornamental friezes and painted bassi-relievi in the temples and ruins in Egypt, and also many of the most ancient remains in Italy are painted in this manner. The fresco walls when painted were covered with an encaustic varnish, both to heighten the colours and to preserve them from the injurious effects of the sun or the weather. Vitruvius (vii. 9) describes the process as a Greek practice, which they termed kausis. When the wall was coloured and dry, Punic wax, melted and tempered with a little oil, was rubbed over it with a hard brush (*seta*); this was made smooth and even by applying a *cauterium*, or an iron pan, filled with live coals over the surface, as near to it as was just necessary to melt the wax: it was then rubbed with a candle (wax?) and a clean linen cloth, in the way that naked marble statues were done. The Abate Requeno supposes that the candles were used as a species of delicate cauterium, simply to keep the wax that it might receive a polish from the friction of the linen, but it is a subject that presents considerable difficulty. This kind of varnish was applied apparently to plain walls only, for Sir Humphry Davy discovered no remains whatever, in the Baths of Titus, of an encaustic varnish upon paintings, although the plain walls had generally traces of a red varnish of this description. Neither Pliny nor Vitruvius mention anything about colour, but this is evidently a most simple addition and does not interfere at all either with the principle or the application of the varnish. Paintings may have possibly been executed upon the walls after they were thus varnished.

Latin Inscriptions.

Inscriptions have been found in great numbers at Rome, in Italy, and all the countries which were once subject to Rome. They embraced the same variety of subjects as the inscriptions in Greece, and if only the principal ones had been preserved the early constitution of Rome would be comparatively clear, whereas now there are a vast number of questions to which we can only answer by conjectures. Some of the Roman writers have, it is true, made use of the most important inscriptions for the early history of Rome, but not by any means to that extent which we could wish. The attention of Roman writers does not appear to have been so much directed towards this source of information as that of the Greeks, for there is no instance of any collection having ever been made by the Romans themselves, although some of them were of the very highest importance in a constitutional as well as legal point of view. At the time of the overthrow of the Western Empire thousands of inscriptions must have perished, especially those engraved on metal, as the material attracted the avarice of the barbarians. But a great number was still preserved in Rome and Italy, which attracted the attention of the learned even in the early part of the Middle Ages. The oldest collection of inscriptions found at Rome exists in the monastery of Einsiedeln; it is written on parchment, and probably belongs to the tenth or eleventh century. It is printed in Mabillon. At the time of the revival of letters the attention of the learned was chiefly directed towards the authors of antiquity, but ever since the fifteenth century attention has also been bestowed upon inscriptions. The man who first formed the idea of a comprehensive collection was Cyriacus of Ancona, who undertook his travels at the request and the expense of Pope Nicolas I.

Association of Ideas.

The architect should guard against the dreamy pleasure excited by what is termed the association of ideas. From this blinding cause have arisen many of the poorest imitations of the day. However much the artist may delight in identifying himself with the past, he should remember that it is past, that the public, that the world has its tastes, habits, ideas, character and life as strongly shown and determined as they ever were in the history of mankind, and that he cannot drive us back to a period which, however it may suit his individual taste, is not our period. In vain shall a modern Deucalion cast stones behind him to vivify the dead; they will remain lifeless. In vain did revolutionary France adopt the names and dress of dead Rome; in vain does this or that man call us back to the days of a Henry or Charlemagne. We will adopt the garments of no past age or nation, as we are we are. Whereof are we ashamed? Is it of the spirit of the age? It should be our glory and thanksgiving to have lived in this time, a time our fathers longed to see, for which our great men wrote and fought and suffered, and of which our architecture should be a type.

What do such men seek in the past which the present may not afford them? But they turn their backs on us as dull and matter-of-fact, and carry that strength to the imitation of the past which should be used for the development of the present. The future historian will judge of these aright when he shall say that those who might have evoked the true spirit of art in these times wasted their knowledge in the raising of lifeless ghosts.

Correggio.

The soft transitions from the convex to the concave line, which connect grandeur with lightness, form the style of Correggio; but using their coalition without balance, merely to obtain a breadth of demi-tint and uninterrupted tones of harmony, he became, from excess of roundness, oftener heavy than light and frequently incorrect. It is not easy, from the unaccountable obscurity in which his life is involved, to ascertain whether he saw the antique in sufficient degrees of quantity or beauty; but he certainly must have been familiar with modelling and the helps of sculpture, to plan with such boldness and conquer with such ease the unparalleled difficulties of his foreshortenings. His grace is oftener beholden to convenience of place than elegance of line. The most appropriate, the most elegant attitudes were adopted, rejected, perhaps sacrificed to the most awkward ones, in compliance with his imperious principle: parts vanished, were absorbed or emerged in obedience to it. The *Danae*, of which we have seen duplicates, the head excepted, he seems to have painted from an antique female torso. But ideal beauty of face, if ever he conceived, he never has expressed; his beauty is equally remote from the idea of the *Venus*, the *Niobe* and the best forms of nature. The *Magdalen*, in the picture of San Girolamo at Parma, is beholden for the charms of her face to chiaroscuro, and that incomparable hue and suavity of bloom which scarcely permit us to discover the defects of forms not much above the vulgar. But that he sometimes reached the sublime, by hiding the limits of his figures in the bland medium which inwraps them, his *Jupiter* and *Io* proves.

Origin of Museums.

Museum was the name given to an institution founded by Ptolemy Philadelphus about B.C. 280 for the promotion of learning and the support of learned men. We learn from Strabo that the museum formed part of the palace, and that it contained cloisters or porticoes, a public theatre or lecture-room, and a large hall where the learned men dined together. The museum was supported by a common fund, supplied apparently from the public treasury, and the whole institution was under the superintendence of a priest who was appointed by the king, and after Egypt became a province of the Roman Empire by the Caesar. Botanical and zoological gardens appear to have been attached to the museum. The Emperor Claudius added another museum to this institution.

GENERAL.

The Queen has been pleased to bestow one of the silver Jubilee medals upon Professor G. Aitchison, A.R.A., president of the Royal Institute of British Architects.

Mr. Henry Ives Cobb, of Chicago, Ill., has been selected as architect of the new Pennsylvania State Capitol, the building which is the subject of litigation by competing architects. Mr. Cobb designed the Fisheries building at the World's Fair, and is at present supervising architect of the United States Post Office building at Chicago.

Mr. Astor's Huge Table, made of a single sectional piece cut out of a Californian redwood tree, has arrived at Cliveden. The slab weighs 13½ tons and stands 16 feet high.

The Marble Bust of Faraday, which has been presented by the Royal Institution to the Michael Faraday School, Faraday Street, Walworth, which is to be publicly unveiled next Monday afternoon, is a copy of the one which was executed by Matthew Noble. It will be placed in the hall of the boys' department upon a pedestal of red granite, which has been provided by the London School Board. To this a plate will be affixed, recording the fact that the distinguished philosopher and chemist was born in the parish of Newington.

Mr. James Paton delivered a lecture in Glasgow this week on Cimabue and Giotto.

The Sanitary Institute.—A sessional meeting of the Institute will be held at the Parkes Museum on Wednesday, November 17, at 8 P.M., when a discussion will take place on "The Pollution of Water-supplies by Encampments of Hop-pickers, Casual Workers, Tramps, &c." To be opened by Professor W. H. Corfield, M.A., M.D. (Oxon), F.R.C.P., in reference to the dangers of pollution of municipal water supplies, and by Miss M. A. Chreiman in reference to the sanitary control of hop-pickers, &c. The chair will be taken by Sir Douglas Galton, K.C.B., D.C.L., LL.D., F.R.S. (vice-president and chairman of Council).

The Architect.

THE WEEK.

THE death of the late JOHN BAGNOLD BURGESS, R.A., who died on Sunday last in his sixty-seventh year, will cause a blank in the exhibitions of the Royal Academy. His Spanish pictures were not only agreeable to visitors, but they were the only representatives of the influence of the revolution which was attempted by WILKIE when he courageously demonstrated that a painter could survive a journey to Spain and come back improved. Some time elapsed before JOHN PHILLIP and W. HURLSTONE attempted a venture so far, and they were succeeded by EDWIN LONG and BURGESS. HURLSTONE was too faithful to Suffolk Street to gain patronage from the public, for there is little hope for anyone who exhibits in the unlucky rooms. PHILLIP was, however, spoiled by favour, and his pictures were valued at sums that bore no relation to their value. LONG's best work will be found in his Spanish scenes, although to the dealers it was more advantageous to recommend to him the production of classic and Biblical scenes. BURGESS was therefore left to exhaust Spanish subjects if he could. He gave refined versions of Spanish life, and there is not much of the fierce passion of the South suggested in his works. BURGESS was gentle in disposition, and he liked to paint scenes in which he could take part, with enjoyment to himself. His colouring was bright, but there was not much daring in any of his attempts, and his figures were carefully modelled although without much force. In any international collection one of his works would be immediately recognised as English. Mr. BURGESS was the son of a landscape painter. He was taught in the Academy schools, and he was so imbued with the *genius loci* that the works of VELASQUEZ and MURILLO were powerless to work any effect upon him. In Spain he found subjects rather than style.

THE trees introduced along suburban roads are gratifying to all eyes in summer, but they cost more than is paid for planting and watching them. In his report to the Willesden District Council, Mr. O. CLAUDE ROBSON, the engineer and surveyor, says "that unless discretion be used in the choice of streets for the trees, trouble will be encountered in the future as the trees mature. Already the paving and adjoining forecourt walls in the Willesden district are showing signs of disturbance by the roots of some of the older trees, and when it be remembered that upwards of 3,000 young trees have been planted since 1890, it will be gathered that there is a possibility of considerable damage occurring in future years where these trees are planted in narrow streets with the houses closely abutting upon the pathway. Very careful consideration should therefore be given to the numerous applications made for trees to be planted, and no sanction accorded except in roadways of sufficient width to ensure immunity from damage to property, and light and air to the road and the trees themselves. In Acton Lane, near to Bramshill Road, owing to alleged nuisance, it was found necessary to remove some of the old trees that were left in the path when the road was widened. Objection was made by some persons as to their removal, but, says Mr. ROBSON, the complaints received from others as to the insanitary nuisance created by them justified the Council in their removal." As trees are sometimes planted as if they could compensate for jerry-built houses on new estates, the experience in Willesden is enough to excite alarm.

ALTHOUGH a Republic, there is no country in Europe where the rights of nobles and of all who are possessed of the privilege to emblazon arms are more strongly asserted than in France. The Baronets' Committee would flourish there. A French judge should now be master of all the delicate points which are concerned in family history and the etiquette of rank. A case which lately was heard in the high courts, and which is of moment to aristocrats, is worth mentioning, for it recalls a writer who cared little for rank, and who laughed boisterously when an antiquary made out

that he was descended from a Border baron. Every reader of CARLYLE's "French Revolution" will remember the fun which he made out of the Supreme Usher of LOUIS XVI., the Marquis de BRÉZÉ, who is "doomed to survive long ages with tremulant white rod." That functionary was tortured by the Third Estate; it is his living successor's fate to have a nephew no less unbearable through his irreverence. The name of M. ROBERT DE DREUX sounds well, but he insists that by law and heraldry he is entitled to call himself, and to be known by all the world, as Vicomte de BRÉZÉ. The Marquis HENRI-SIMON-CHARLES DE DREUX-BRÉZÉ invoked the interference of the Tribunal of Mans, on the ground that the title Vicomte was comprised in that of Marquis, and, as IAGO says, to filch one's good name was to leave the owner poor indeed. The tribunal decided in favour of the uncle, but the Court of Appeal at Angers reversed the judgment. It was laid down that all the descendants of the family were entitled to call themselves DREUX-BRÉZÉ if they wished, and as to the assumption of Vicomte, that was an affair for the Chancellerie, and not for a law court. The case was brought before the Cour de Cassation in Paris, but the Marquis failed to establish his right to any monopoly of name or title. The Supreme Usher thought he could keep out the tide of democracy by opening only one of the folding doors to the commons, while *noblesse* and clergy passed through two. It would now appear there is nothing can stem the host of DE BRÉZÉS who will invade the family circle as a consequence of the judgment. But how is the archæology of the family and the individual to be followed by experts if Courts will be as lax as those of Angers and Paris? Archæologists at least will side with the Marquis.

THE question, "What is a work of art?" has had to be considered by the Board of United States General Appraisers, who have to determine under what class importations on which duties are to be levied should be assessed. It arose out of two classes of sculpture, viz. a reredos for a church, which came from France, and a case of reproductions of the *Venus of Milos*, *The Graces*, *Diana*, &c. One of the witnesses who described the reredos as an "architectural production," and therefore not a work of art, qualified his statement by saying: "It is difficult to define a work of art or to say just where a work of art begins or where it ends. In a large sense everything, from the commonest design on a cheap cast-iron stove to the frieze of the Parthenon, can be included in the expression 'works of art.' There is no established line; every man draws his own line. The nearest I can get to it is that what is generally understood by artists as a work of art purely is only such as is produced by a professional artist in his own studio, either wholly by himself or with such assistance as he needs, under his own immediate direction and supervision. According to my understanding, this is distinctly and only what was meant by the words 'works of art' in the phraseology of the law." The board, however, asserted that to the general appraisers works of art were the inspired creations of the artist, rather than the works of artisans or mechanics; and were of marble, stone or other solid substance, such as were the professional productions of statuary or sculptors only, and not products of the factory or workshop. Congress, when it allowed free admission to works of art, was endeavouring to aid in the education of the country and the encouragement of fine art, but that object would be defeated if the productions of foreign industrial establishments, although executed from the designs of American artists, were placed in the same class. The altar and reredos was therefore charged with duty, as "dressed Caen stone." As to the copies of antique statues, they were treated as mechanical productions. According to the board, the only statutory that is entitled to classification under the law as the professional productions of a statuary or sculptor is such as is produced by a professional sculptor in his own studio, either by his own hand or by others under his direction and supervision, and to which he has himself given the final chasing or finishing touches and expression, including (1) the original, from his own design or conception; (2) a replica or copy thereof; or (3) an artistic copy of a work, a masterpiece, of another artist. The object must be his professional production.

ROBERT BURTON AS A SANITARIAN.

IT has been the fate of the author of the "Anatomy of Melancholy" to have only extremists for his critics. To CHARLES LAMB he was a scholar to be worshipped; to HENRY HALLAM he was a mere sweeper of miscellaneous literature from the Bodleian Library. Dr. JOHNSON declared that BURTON'S book was the only one that ever took him out of bed two hours sooner than he wished to rise, while BYRON said that a man would be more improved by it than by any twenty other works. Modern readers are likely to be found in the camps of the idolaters or of the snarlers, therefore it is almost impossible to obtain an impartial judgment on ROBERT BURTON. We have no wish to undertake the task of assessing his merits and defects; we simply are eager to consider him from a standpoint which hitherto was overlooked, but it will be necessary in the first place to say a few words about the man.

ROBERT BURTON is supposed to have been born in 1576-77 at Lindley, in Leicestershire, where his father owned an estate. He was taught in the school of Sutton Coldfield, a town which he described as having an excellent air and as full of all manner of pleasures. In 1593 he entered Brasenose College, Oxford. In 1599 he was elected student at Christ Church. He obtained in 1614 the degree of Bachelor of Divinity, and two years afterwards he became vicar of St. Thomas's, Oxford. The rectory of Segrave was presented to him in 1630. He seems to have given attention to his ministerial duties, but he passed as much time as possible in Oxford. He died in 1640, and a legend arose that he had poisoned himself in order to prove the accuracy of his astrological calculations concerning himself. A year before his death he described himself as being in perfect health of body and mind.

There is so much kinship between all branches of old world learning that many a scholar in Oxford, if he had taken up the subject of melancholy, would have gathered round it a great many of the allusions which are found in BURTON'S book, but he does not always write as a scholar alone. It is reasonable to conclude that he investigated the symptoms of melancholy and sought out the remedies for it, because he himself was a sufferer. It is the personal element which is one of the causes for the survival of BURTON'S treatise while so many contemporary works have gone their way to oblivion. Melancholy, indeed, seems to have been a common disease of the period. Men had anticipated that the new philosophy was to bring new happiness, but just as we find that machinery, evolutionary philosophy, strange forms of government and various other influences all foster pessimism, so in the sixteenth and seventeenth centuries men discovered that there was very little difference between them and their unscientific forefathers. In BURTON'S book we have combined the ancient and the modern. He admired "our noble and learned Lord VERULAM," and describes him as "an honourable man;" he was familiar with all his writings, but he was not prepared to sacrifice to them the books of the ancient worthies with all their *idola*.

The combination of past and present is curiously exemplified in that part of his book which relates to what would now be called sanitary surroundings. BACON loved comfort, and he wished to have houses which were safe to live in as well as agreeable to the sight. BURTON says more about the advantages of suitable air, water and site than BACON or any of the physicists of that time, but he could not forget that hundreds of his predecessors also treated of the subject. He tells us that having come into the ample fields of air, he intends to "freely expatiate and exercise myself for my recreation, awhile rove, wander round about the world, mount aloft to those ethereal orbs and celestial spheres, and so descend to my former elements again." No long-winged hawk could be more discursive. But his efforts were nothing if compared with his aspirations. BURTON regrets that he cannot observe all the secret operations of nature. The sea is a mystery to him; he cannot discover the cause why the ocean, which in one place was supposed to be always pacific, should become in our British seas most violent, whilst elsewhere it is vehement, irregular and diverse. He wishes also to have a glimpse of the great American city of El Dorado, where the highways are as much beaten as those between Madrid and Valladolid. "I

would find out," he says, "with TRAJAN the fountains of Danubius, of Ganges, Oxus, see those Egyptian pyramids, Trajan's Bridge, Grotta de Sibylla, Lucullus's Fishponds, the Temple of Nidrose, &c." We find, in fact, in BURTON that craving for an exact knowledge of nature which no books could then afford, and it cannot be said that all the questions he raised about the earth and its inhabitants are yet solved.

However high he might soar, BURTON was compelled to come back to melancholy. He could not understand why there should be varieties of air, but he maintained that "as the air is, so are the inhabitants, dull, heavy, witty, subtle, neat, cleanly, clownish, sick and sound," and he asks, Is not a great difference manifested between Surrey, Sussex and Romney Marsh, the wolds in Lincolnshire and the fens? The conclusion he draws is that whoever loves his health, if his ability will give him leave, "must often shift places and make choice of such as are wholesome, pleasant and convenient. There is nothing better than change of air in this malady, and generally for health to wander up and down, as those Tartari Zamolhenses that live in hordes, and take opportunity of times, places, seasons." Then, in support of his theory, he goes back to the practice of the ancient Persians and the Romans and the great Turk, who, from what BURTON says, was always a very wise man. It was probably with philosophic envy he recorded that "the Bishop of EXETER had fourteen several houses all furnished in times past." In England, however, he maintained that the best soil commonly yields the worst air, and that a dry, sandy plot is fittest to build upon. BURTON recognised that every man could not select a favourable site, and then he recommends the reader to make the best of what is attainable. He writes:—

If the air of the dwelling may not be altered, yet there is much in choice of such a dwelling or room, in opportune opening and shutting of windows, excluding foreign air and winds and walking abroad at convenient times. Crato, a German, commends east and south site (disallowing cold air and northern winds in this case, rainy weather and misty days), free from putrefaction, fens, bogs and muck hills. If the air be such, open no windows, come not abroad. Montanus will have his patient not to stir at all if the wind be big or tempestuous, as most part in March it is with us; or in cloudy, lowering, dark days as in November, which we commonly call the black month; or stormy, let the wind stand how it will, and he must not open a casement in bad weather or in a boisterous season; he especially forbids us to open windows to a south wind. The best site for chamber windows in my judgment are north, east, south, and which is the worst, the west. Levinus Lemnius attributes so much to air and rectifying of wind and windows that he holds it alone sufficient to make a man sick or well, to alter body and mind. "A clear air cheers up the spirits, exhilarates the mind; a thick, black, misty, tempestuous air contracts and overthrows." Great heed is therefore to be taken at what times we walk, how we place our windows, lights and houses, how we let in or exclude this ambient air. The Egyptians, to avoid immoderate heat, make their windows on the top of the house like chimneys, with two tunnels to draw a through air. In Spain they commonly make great opposite windows without glass, still shutting those which are next to the sun. So likewise in Turkey and Italy (Venice excepted, which brags of her stately glazed palaces), they use paper windows to like purpose, and lie *sub dio* on the top of their flat-roofed houses, so sleeping under the canopy of heaven. In some parts of Italy they have windmills to draw a cooling air out of hollow caves, and disperse the same through all the chambers of their palaces to refresh them; as at Custozza, the house of Cesareo Trento, a gentleman of Vicenza, and elsewhere. Many excellent means are invented to correct nature by art.

If the accounts of foreign practice in building seem to be ridiculous, we must remember there were no facilities for travel in the seventeenth century, and an Oxford scholar, although possessed of two livings, was compelled to accept the wonders of the world abroad on hearsay. What is said makes it plain that BURTON and his contemporaries were not entirely satisfied with the houses of the time and that a remedy was considered desirable. He expressed what was probably the earliest appeal on behalf of sanitation.

BURTON was too much of an Englishman not to love comfort, and however light might be the air which was about his dwelling, it would not satisfy him unless there was also a cheerful interior. He tells us that "of colours it is good to behold green, red, yellow and white, and by all

means to have light enough, with windows in the day, wax candles in the night, neat chambers, good fires in winter, merry companions; for though melancholy persons love to be dark and alone, yet darkness is a great increaser of the humour." It is remarkable to find the influence of colours so well expressed at that time. According to FEUCHTERLEBEN, colours produce an effect on the mind. The positive colours, red, yellow, &c., are supposed to be exciting, blue and negative colours charm it. BURTON's patient, who was probably himself, was, we suppose, too calm, and therefore blue is omitted from his list. This is not the only case in which he appears to anticipate the experience of our time.

Merry companions in those days were not renowned for water-drinking, and BURTON acknowledges his love of good wine. The necessity of a supply of pure water was, however, recognised by him, and he recommended those whom Melancholy marked for her own to make use of it. In one passage he says:—

Pure, thin, light water by all means use, of good smell and taste, like to the air in sight, such as is soon hot, soon cold, and which Hippocrates so much approves, if at least it may be had. Rain water is purest, so that it fall not down in great drops, and be used forthwith, for it quickly putrefies. Next to it fountain water that riseth in the east and runneth eastward, from a quick-running spring, from flinty, chalky, gravelly grounds; and the longer a river runneth, it is commonly the purest, though many springs do yield the best water at their fountains. The waters in hotter countries, as in Turkey, Persia, India, within the tropics, are frequently purer than ours in the North, more subtle, thin and lighter (as our merchants observe) by four ounces in a pound, and some of them, as Choaspes in Persia, preferred by the Persian kings before wine itself. Many rivers, I deny not, are muddy still, white, thick, like those in China, Nile in Egypt, Tiber at Rome; but after they be settled two or three days, delicate and clear, very commodious, useful and good. Many make use of deep wells, as of old in the Holy Land, lakes, cisterns. When they cannot be better provided they fetch it in carts or gondolas, as in Venice, or on camels' backs, as at Cairo in Egypt; Radzivilius observed 8,000 camels daily there employed about that business. Some keep it in trunks [tanks, bowlees,* or reservoirs] as in the East Indies, made four square with descending steps, and it is not amiss; for I would not have any one so nice as that Grecian Calis, sister to Nicephorus, Emperor of Constantinople, and married to Dominicus Silvius, Duke of Venice, that out of incredible wantonness would use no vulgar water; but she died of so fulsome a disease that no water could wash her clean. Plato would not have a traveller lodge in a city that is not governed by laws or hath not a quick stream running by it; one corrupts the mind, the other the body. But this is more than needs, too much curiosity is naught; in time of necessity any water is allowed. Howsoever, pure water is best, and as Pindar holds, is better than gold; an especial ornament it is, and very commodious to a city (according to Vegetius), when fresh springs are included within the walls, as at Corinth, in the midst of the town almost, where was a goodly mount full of fresh-water springs; "if nature afford them not they must be had by art."

Living in Oxford, where he was surrounded by fine Mediæval buildings, BURTON could hardly help concluding there was no better way to express appreciation of anything than through the medium of the best architecture that was procurable. Repeatedly we find him referring to buildings as if they were incontrovertible evidence of the truth of his conclusions; consequently he seems to exult in the ancient efforts to bring water as if it were a treasure to cities, although at the same time he is not oblivious of the advantage of the unassuming works of his contemporaries MYDDELTON and NICHOLSON. We give one extract:—

It is a wonder to read of those stupend aqueducts, and infinite cost hath been bestowed in Rome of old, Constantinople, Carthage, Alexandria, and such populous cities to convey good and wholesome waters. That aqueduct of Claudius was most eminent, fetched upon arches 15 miles, every arch 109 feet high. They had fourteen such other aqueducts,

besides lakes and cisterns, 700, as I take it; every house had private pipes and channels to serve them for their use. Peter Gillins, in his accurate description of Constantinople, speaks of an old cistern which he went down to see, 336 feet long, 180 feet broad, built of marble, covered over with arch-work, and sustained by 336 pillars, 12 feet asunder and in eleven rows, to contain sweet water. Infinite cost in channels and cisterns, from the Nile to Alexandria, hath been formerly bestowed, to the admiration of these times; their cisterns so curiously cemented and composed that a beholder would take them to be all of one stone; when the foundation is laid and cistern made their house is half built. That Segovian aqueduct in Spain is much wondered at in these days, upon three rows of pillars, one above another, conveying sweet water to every house; but each city almost is full of such aqueducts. Among the rest he is eternally to be commended that brought that new stream to the north side of London at his own charge; and Mr. Otho Nicholson, founder of our waterworks and elegant conduit in Oxford. So much all times attributed to this element, to be conveniently provided of it. Although Galen hath taken exceptions at such waters which run through leaden pipes, for that unctuous ceruse which causeth dysenteries and fluxes, yet, as Alsarius Crucius of Genoa well answers, it is opposite the common experience. If that were true, most of our Italian cities, Montpelier in France, with infinite others, would find this inconvenience, but there is no such matter.

BURTON does not forget that in many ways a gentleman who is melancholy can aid in overcoming the disease by ministering to himself. He advises the patient to oversee his workmen, but in our days that would be likely to make the soundest man become melancholy. To build, plot, project, to make models, &c., are also suggested as remedies. About the influence of works of art upon the mind that is diseased, BURTON has no doubt. He has the golden-lipped bishop on his side, for, as he says, "CHRYSOSTOM thinketh if any man be sickly, troubled in mind, or that cannot sleep for grief, and shall but stand over against one of PHIDIAS's images, he will forget all care or whatsoever else may molest him in an instant." And yet the Parthenon room in the British Museum is deserted. The paintings of MICHEL ANGELO, RAPHAEL, FRANCESCO FRANCESCA, and some by Italian and Dutch masters are recommended. It is true BURTON admits pictures are mere toys, and can afford only temporary pleasure; but who, he asks, will not be moved with them for the present? Everything is fleeting, even pleasure that is intellectual; but "Carpe diem" should be the melancholy man's motto. BURTON recalls how, "when ACHILLES was tormented and sad for the loss of his dear friend PATROCLUS, his mother, THETIS, brought him a most elaborate and curious buckler made by VULCAN, on which were engraven sun, moon, stars, planets, sea, land, men fighting, running, riding, women scolding, hills, dales, towns, castles, brooks, rivers, trees, &c., with many pretty landscapes and perspective pieces, with sight of which he was infinitely delighted, and much eased of his grief." Art is a consoler, as the Olympians knew, and BURTON was wise in treating it as a medicament. Modern sanitarians would do well to follow his example, for a sewage policy is not enough to make us all happy.

ELECTRIC TRAMWAYS.

By F. J. WARDEN-STEVENS, A.M.I.E.E.

(Concluded from page 308.)

The Central Station (continued).

THE use of accumulators is extending rapidly in connection with the generating plant for electric tramway stations. The accumulators are usually placed at the distant portions of the line, and serve the double purpose of keeping the pressure fairly constant and of taking up any great fluctuations in the demand. The reasons that an accumulator will take up a load, or supply a high current without allowing a large change of pressure, are that the back pressure of an accumulator is practically independent of the charging current, and that the internal resistance of the accumulator is extremely low. It follows, then, that if the right number of cells are employed for the back pressure

* In Fergusson's *Indian and Eastern Architecture* it is said:—"To persons not familiar with the East such an architectural object as a bowlee may seem a strange perversion of ingenuity, but the grateful coolness of all subterranean apartments, especially when accompanied by water, and the quiet gloom of these recesses, fully compensate, in the eyes of the Hindoo, for the more attractive magnificence of the ghâts. Consequently the descending flights have often been made more elaborate and expensive pieces of architecture than any of the buildings above ground found in the vicinity."

to equal the pressure on the mains, the amount of current taken into the cell if the pressure is raised a little, or given out if the line pressure is lowered a little, will be large, and will depend chiefly upon the internal resistance. By this means the pressure on the mains can be kept nearly constant, while a great portion of the starting strain is taken by the accumulators instead of the engine. In cases where the pressure is liable to vary much, but not quickly, an automatic regulator is often used, which inserts or cuts out (accumulator) cells, so keeping the voltage constant.

There are instances where the motive-power employed in a tramway station is gas, one example being at Lausanne, where two 130 horse-power gas-engines are run for about eighteen hours per day, producer gas being employed. The amount of fuel used is about $4\frac{1}{2}$ lbs. per car mile. There have not up to the present been many of these plants in operation, and it is difficult to say whether they will be a success ultimately or not; but in general the gas-engine is not suited for heavy overloading. However, a large battery is generally used, and this takes up the fluctuations and acts as a reserve.

The question of the steam-engine has been gone into fully because there is an impression that ponderous slow-speed engines are necessary, with belt drives.

Combination Schemes.

It is evident even with electric traction that the engines are not always fully loaded, and there is spare power at some part of the twenty-four hours which might be used for some other purpose. The view that power can be spared is, however, as a rule an incorrect one, because the idle hours are often used for charging batteries of accumulators situated at distant portions of the line. It is therefore fairly evident that as the load factor, *i.e.* ratio of power delivered to the possible power that could be delivered if full load had been on the whole time, is about 50 per cent., and that the engines work very economically at this load, but there is very little economy to be gained as far as the tramway is concerned by combining it with any other work or works. Now, although this is the case, there are other concerns which are only too pleased to obtain the tramway load in order to improve their load factor. The most important case is that of an electric-lighting station, and this is the one I will consider most fully.

The condition of running in an electric-lighting station is that if the load were only on steadily throughout the twenty-four hours the maximum plant used in the evening even in winter would usually supply ten times the amount of electricity that is supplied. It is this fact which has held back electric lighting for many years. It has been shown that electricity can be supplied for tramways at 1*d.* per unit with a profit, but there is no electric-light station which can do this, on an average, for electric lighting at less than $4\frac{1}{2}$ *d.* per unit.

The reason for this difference has already been mentioned in previous articles. It is because the mains and plant are only used for an hour or so out of the twenty-four. The capital outlay is large in proportion to the number of units generated, and it is found that the fixed charges are, as a rule, about three-fourths of the whole cost. That is to say, this 75 per cent. has to be expended whether many or few units are sold, and only about one-fourth of the expense is proportional to the number of units sold.

Thus it may easily be seen that, for a given plant running three hours a day at say half the maximum load, the cost is much more per unit generated than if running for fourteen or fifteen hours a day at half the maximum load.

The case of the lighting works is this:—We have enough plant here to supply the tramways, it is standing idle all day, why not use it? The tramway undertaking will be saved from the necessity of erecting works, and we can supply the electricity as cheaply from our station as it can be supplied from a traction station. There is a great deal to be said for a combination scheme from this point of view, although it must be remembered that the saving to the tramway undertaking will be little, but the lighting undertaking will have a great help. In these days of municipal enterprise there are many towns in which the tramways and electric lighting are both under the control of the municipality, and the question becomes one of importance.

There have been several combinations proposed to carry out this idea. One in which separate engines, dynamos and mains are used for each, the boilers being the same for both; another in which the engines and dynamos are the same for both, as well as the boilers. It is not seriously proposed to use the same mains in any case, as the variations in pressure allowable for tramway working would be quite impossible for lighting. In considering the advantages to be derived by such combinations it will be well to note under what heads a saving may be effected. In the first place there is a possibility of a reduction in capital outlay for buildings, even if the combined plant takes up the same floor space as the two separate ones; there is a saving in management expenses; the boilers run more economically and fewer stokers are required; the engine-drivers will not be increased in proportion to the size of the plant, and no doubt the engines will be worked at more economical loads. In the case where the same boilers only are used, all the savings in the above list may be effected, and there is no doubt that a portion of the boilers can be dispensed with, effecting a further saving in buildings and maintenance, cleaning, &c. When the same engines and dynamos are used for the two purposes, assuming that this is feasible, there is no doubt that the load in the evening will hardly be as large as the sum of the heaviest tramway and lighting loads; but even if it is, there will still be a means of keeping this load off the dynamos by the use of accumulators for the short-time, and the engines can be run with little expansion, which no doubt is hardly economical, but this will have no appreciable effect upon the costs, as the duration of the heaviest load is so short. With regard to this overlapping of the loads on a combined central station, the trams are as a rule far heavier loaded in the summer than in the winter. This is especially the case at seaside resorts, where the tramway is often closed altogether in the winter. This fact materially reduces the heaviest load on the station, and as a result the plant needed is less for the combined than for the two separate stations. A further point worthy of consideration is that of reserve plant. It is evident that with a combined station less reserve is required in all departments than the sum of the reserves required in separate stations, as the reserve must be at least equal to the largest unit of plant, either boiler, engine or dynamo.

The saving in administrative expenses will be considerable. The departments would be:—(1) Production; (2) distribution; (3) tramway; (4) private and public supply, instead of Nos. 1, 2, 4 for lighting, 1, 2, 3 for tramway, or four departments in the place of six.

A point of great interest is the price which should be charged for electricity for the tramways. This price should be the cost of producing the tramway units plus a percentage for profit; not, as is often suggested, a price which will enable the lighting current to be reduced to the same cost per unit as the traction units. This policy is, as Mr. WRIGHT (borough electrical engineer, Brighton) has lately very justly pointed out, robbing Peter to pay Paul. It is unfair that the passengers on the tramcars should help to pay the loss on the lighting units, and provide the people who do not ride on the cars with light at less than cost price. It is found that a load of the same nature as the tramway load can be supplied as a rule at an average of 1*d.* per unit, and the lighting load at about $4\frac{1}{2}$ *d.* per unit (average), with the same percentage of profit. This 1*d.* per unit is as cheap as or cheaper than it could be supplied from a separate plant.

By adopting a fair system of charging the economy of the combination will be felt in both departments in proportion as they deserve it.

A case which lends itself most particularly to economical working is where the accumulator traction system is combined with the lighting. Here the load can be spread far more evenly over the 24 hours, the starting loads and disturbance of pressure are taken away, and great economy is experienced. The plant which supplies the lighting will also supply the accumulators, and there need be no overlapping of the loads if a little care is exercised. Further, the same mains will apply for the tramway sub-stations as for the lighting. There is no need to further discuss this, as the advantage is obvious. The interest on capital of the tramway plant is saved, the engines can be kept fully

loaded for the whole 24 hours, or nearly so, no extra staff is required at the generating station and no extra management. The only expense to the tramway is the cost of attendance while the cells are charging, and the ordinary running costs.

There are some difficulties in the way of using the same plant for lighting and traction where one of the conductors is connected to earth in the latter. In a three-wire, or in fact any system of distribution to consumers, the difference of pressure between earth and any terminal must not exceed 250 volts. A tramway cannot be economically run at a lower pressure than 450 volts, and as one conductor is earthed, the pressure between the other conductor and earth is 450 volts. If the two sets of mains are connected to the same dynamo, the 250 volts pressure limit for lighting is exceeded. The interconnection must be made by means of motor transformers with the motor winding on the lighting pressure and the dynamo one on the tramway, or *vice versa*. The former is used when the lighting load will be greater than the tramway, and the latter in the reverse case. It is worth mentioning that in most towns the probable demand for light and motors for power will greatly exceed that for tramways in the near future.

The Dover tramways, which have just been opened, is the only example in actual operation in this country of a combined electric-lighting and tramway plant. The Corporation own the tramways, which are nearly $4\frac{1}{2}$ miles long, and the power is obtained from the local electric-lighting company, although from a separate plant. The price paid is 3d. per unit, subject to a sliding scale as the consumption of energy increases. This price is, no doubt, high, and could in many cases be reduced. The plant provided by the company for the tramway consists of two 200 horse-power Babcock & Wilcox boilers (water tube), two horizontal tandem compound-engines, coupled direct to four pole railway generators of 100 kilowatt capacity each. The pressure is 500 volts, continuous. Thus the only difference so far is that the plant is under one management and one staff instead of a separate one. However, there is a connection between the lighting circuit and the tramway circuit in the shape of a motor generator, one machine being an alternator at 2,500 volts and the other a continuous current machine at 500 volts. The alternator takes power from the lighting circuit for handling the cars in the sheds when the tramway plant is shut down, and gives power for the lighting circuit from the tramway generators in the daytime, or can do this when required.

It will be seen that there is no great step in combined plants in this case, especially as the Corporation uses and a company generates the electricity. However, there are far more important works in course of construction or decided upon at Plymouth, Portsmouth, Glasgow, Manchester and other towns, and in a year or so one may expect to see some real combination plants at work here.

There is a case of a combined plant in Europe which has been running for some time with great success, and to which sufficient attention has not been given by engineers in this country. It is the Rome light and power station. There is at Tivoli (18 miles from Rome) very large water-power; the quantity of water usually available is 800 gallons per second, and the fall is about 160 feet. The power obtained is about 2,000 horse-power, and the plant at present consists of six 250-kilowatt alternators, running at 170 revolutions per minute, direct coupled to turbines. There are also three direct coupled exciters of 27 kilowatts each for these alternators. Ordinary alternating currents at a pressure of from 6,000 to 7,000 volts, at a low periodicity of 43 cycles per second, are transmitted to Porta Pia, in Rome (18 miles off). The pressure in Rome is 4,100 volts. The loss of energy in the line is about 18 per cent. at full load, the extra loss of pressure at Rome being due to the impedance (resistance to alternating current in which no power is wasted) of the line, and does not necessarily mean waste power.

The power is transmitted by four bare copper wires on poles, each having a sectional area of 15 square inch, and supported by oil insulators of special design.

At the Porta Pia sub-station the current is divided into three circuits; one for lighting and motors, one for arc lighting, and the other for tramways. The current for the tramways is supplied at 400 volts alternating, by means of

transformers, continuous currents being provided by rotary transformers, which convert this alternating current at 400 volts to a continuous current at 566 volts pressure. The alternating current is supplied to a rotary armature, and is converted to a continuous current at a higher pressure. When more than 60 kilowatts are required, the power is supplied by motor generators, the motor being a synchronous alternating one (that is, one running in step, in this case with the generator at Tivoli), driving a 550 volt continuous current dynamo. These rotary transformers and motor generators are paralleled on their continuous current side to a large battery of Tudor accumulators, consisting of 304 cells with 1,864 ampere hours' capacity; 108 of these cells are used for regulation purposes. An automatic regulator is provided, which keeps the voltage on the tramway circuit constant. An arrangement is also used for keeping the load on the generators constant, notwithstanding the variations of the power demanded, the battery taking up the fluctuations.

The current for public lighting is provided at 500, 1,000, 1,500 and 2,000 volts for separate circuits, according to the number of arc lamps in series on each circuit. The current is kept constant at 14 amperes and is alternating, being supplied by transformers. The private lighting and power is also alternating, the high-tension distributors being at 2,000 volts, and there are several sub-stations supplying nearly 50 miles of low-tension mains at 100 volts.

It will thus be seen that this station is fulfilling the real duties of a combined plant, all the power required for lighting (public and private), power and tramways being supplied from one plant. I believe that another fall is being utilised and 2,000 horse-power more will be available next year.

I have endeavoured in these short articles to give a fair and unbiassed account of what is occurring, and a review of what has been done in electric traction in this country, and I also trust that the examples of the Paris, Hanover and Rome tramways will show what can be, and probably what might be, done in this country if our conservatism gives place to enterprise.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Professor Aitchison, A.R.A., president, in the chair.

The minutes of the last meeting were taken as read.

A paper was read by Mr. Arthur S. Flower, M.A., F.S.A., entitled

Notes on Renaissance Architecture in Malta

(with special reference to the Buildings of the Order of St. John).

In introducing his subject Mr. Flower alluded to the ignorance and erroneous impressions that generally prevailed about Malta among English people, and to the scant regard paid the island by architectural writers. Small as it was, Malta teemed with huge buildings, the product of centuries of activity and ambition. Churches, palaces, castles possessed a character, unusual, striking, commanding, which rendered it, to the lecturer's mind, one of the most interesting spots in Europe. The island was composed of one solid block of almost perfect building stone. A house might be built from the stone cut out from its own cellars, a fortress from its own moats, a cathedral from its crypts. Stone was the one material employed in buildings, and was extensively used for other and many novel purposes. It might be described as a mason's earthly paradise. The inhabitants seemed to be born masons.

No higher testimony could be given to the beauty and interest of the buildings than the enthusiasm they aroused in the cultivated and critical mind of the late Dean Church, who thought Valletta one of the most striking specimens of architecture he had ever seen. Some interesting passages from the Dean's published letters were quoted, describing his first view of the capital and of the general aspect of the interior of the island.

Besides the ethnological and geological conditions, the politico-religious influence exerted by the Knights Hospitallers had been an important factor in the architectural development of Malta. Its architectural splendours were chiefly due to them. Relics of former rulers—the so-called Phœnician remains, fragments of Greek and Roman structures, various beautiful evidences of Sicilian-Norman influence—the lecturer passed over as belonging more to archæology than to architecture. His purpose was to deal with buildings still in regular

occupation and use, belonging to a style most conveniently to be described as Renaissance. These were erected during the palmy days of the Knights of St. John, from the beginning of the sixteenth to the beginning of the eighteenth century. In explanation of how they came into existence, the lecturer briefly sketched the history of the Order, and the various vicissitudes it passed through from its foundation in Jerusalem early in the eleventh century till its establishment in Malta. This happened in 1530, when the Maltese islands, at that time little better than desolate barren rocks, were ceded to the Hospitallers in perpetual sovereignty. Fear of Turkish attacks compelled them to devote their first years to necessary fortifications, nearly all to be reconstructed after the great siege of 1565, when the Turks were finally repulsed. The creation of Valletta, a city which suddenly sprang up on a very unpromising site, the summit of a bare ridge never before occupied by buildings, was entirely the work of the Grand Master, La Vallette. The first stone was laid on March 28, 1566, at the corner of St. John's bastion, La Vallette taking up his abode in a wooden hut on the spot, and directing operations day by day until his death in 1568. So far nothing had been built except the fortifications. Del Monte, the new Grand Master, took equally great interest in the work, beginning his term by announcing that no one should enjoy his favour who did not promote the building of the city. At La Vallette's death nothing had been built except the outer fortifications. The first house, interesting as forming the nucleus of the present Governor's palace, was built by the Grand Master's nephew, Eustachio del Monte, in the centre of the high ground, on the place occupied by one of the Turkish batteries during the siege. In the next year, 1570, the designing of all the works, military, civil, and even ecclesiastical, was entrusted to Gerolamo Cassar, a very remarkable man, whom a document, dated May 18, 1581, refers to as the "ordinary architect and engineer of the Order . . . from 1565 to 1581." The most notable of his numerous works was the church of St. John. In 1571 the headquarters of the Order were transferred to the unfinished city.

The lecturer then gave a detailed description, illustrated by photographs and plans, of St. John's, Valletta, and other buildings and architectural features of note in the capital and other parts of Malta. The great hospital was one of the first buildings erected by the Knights, and always maintained on a lavish scale of expenditure. It is noteworthy as containing the largest ward ever built, 503 feet long by 35 feet wide, with a shorter ward of the same width leading out of it. Valletta alone has twenty-four churches, many of them splendid buildings, besides chapels and oratories. Outside Valletta, in the suburbs and country villages, there are a still greater number of churches, together with almost innumerable detached chapels. The latter are mostly octagonal on plan and domed, with very graceful outlines. The larger village churches have usually two western towers and a dome at the crossing. The dimensions of two typical churches, both dating from the seventeenth century, are:—Zeitun Church, 153 feet long and 111 feet broad, including side chapels, with a nave 31 feet wide; and Zebbug Church, 165 feet by 122 feet, and 32 feet across the nave. There were some forty of these village churches in Malta.

Città Vecchia, or Notabile, originally the chief city of the island, and the scene of St. Paul's sojourn there, is exceedingly picturesque both within and without. Its Romanesque cathedral was destroyed by an earthquake about 200 years ago, and the present building, of which Lorenzo Gafà, a Maltese, was architect, was consecrated in 1702. Noteworthy are the nave, upwards of 36 feet in span; the carved and inlaid choir-stalls, said to date from 1480, and the gorgeous altar ornaments and other treasures which escaped pillage by the French in 1798.

The lecturer concluded with a few remarks on the characteristics of the architecture of the Order. The term Palladian applied to it by Dean Church he considered inappropriate; it was more akin to early Florentine Renaissance than to any other type. With regard to a suggestion made by Mr. Ingress Bell that Spanish architects in great numbers were employed upon the city of Valletta, which he thought accounted for the similarity between the architecture of Malta and that of some of the Belgian towns, the lecturer, while granting the resemblance to Spanish work, particularly in ornament, could find no evidence of the actual presence of Spanish architects. Whencesoever derived, all the buildings of what might be called the heroic age of the Order were exclusively Doric.

The majority of the photographs represented mostly the later buildings.

Colonel Prendergast, who had been asked by the President to start the discussion, said he reluctantly did so, as he had come there to learn and not to teach, but he asked permission to propose a vote of thanks to Mr. Flower for his very interesting paper. Malta was a closed book, and few visitors could say anything of its architectural attractions. The stone of the island was a material which could be manipulated like chalk. It lent itself to decoration, for although of a soft kind, it hardened with

exposure. The points that were brought before them seemed of much interest, because it was unique to find such buildings erected, so to speak, for an employer. The Grand Masters of St. John were very great personages, and had large funds at their disposal which they seemed to have used freely. What appeared strange to him was the criticism regarding the church of St. John. The building abounded in faults. It was almost as flat a roofed building as they could have; it was out of proportion, and the height was altogether wrong, but the whole had been so nicely dealt with that one could not help liking it. These buildings were all built for a specific purpose. This church was merely a series of chapels; each country had its chapel. Among the drawings on the screens there would be found a picture of the church of St. Elmo, which was in the Early Renaissance style. The architect had made each of his chapels have more or less some resemblance to those in St. John's, although it was perhaps obscure. This was before the time when one wished to represent a Roman palace or something of that kind, and he had got rid of the heavier appearance.

The Rev. W. K. R. Bedford seconded the vote, and said he was able to appreciate the remarks in the paper. The roof of the church of St. John was original. A great deal of the church was modern. Most of the ornamentation dated from 1660 or thereabouts, but the roof was part of the original plan. The chapel of St. Elmo, which dated from about 1530, was Gothic rather than Renaissance in style, and was the first building of the Knights of St. John in the island. He called their attention to a very important fact subsequent to the first erection in Valletta. Though the Italian influence prevailed to a great extent, there were two great waves of reconstruction which passed over the fortunes of the Order. The Spanish Grand Master, and a great many of them that came in succession, brought in Spanish ways, and they found Spanish balconies fixed to Italian buildings. Another century had elapsed, and the last Grand Master erected buildings more in the French style, and so they had very nondescript styles, one with another, expressing in artistic degree the buildings in order. He was sorry to say that there was unhappily another way of construction in these days. As the leases of old buildings fell in, the jerry-builder turned them into flats.

Colonel Hogg, late commanding engineer, said the local authorities endeavoured to make new buildings for the Government harmonise with the older work, but as the drawings were prepared in London the task was not easy.

Mr. T. Blashill asked whether the late Eliot Warburton's statement about the deserted condition of Città Vecchia still remained true.

The Rev. Mr. Bedford, in reply, said the statement was exaggerated.

After a few words from the President, Mr. Flower briefly returned thanks.

PERTH ARCHITECTURAL ASSOCIATION.

THE inaugural meeting of the Perth Architectural Association was held in the lecture-room of the Perthshire Society of Natural Science on the 9th inst., when Mr. Hippolyte J. Blanc, R.S.A., Edinburgh, delivered an opening address. There was a good attendance, and Mr. G. P. K. Young, the president, occupied the chair. Among those present were practising architects of the city.

The Chairman, before introducing Mr. Blanc, explained the objects of the Society. It had been formed entirely by the young men in the district who were interested and actively engaged in the study of architecture and engineering, and with a view to carry out their desire to improve their knowledge they had combined to obtain better facilities for that purpose. The means they proposed to adopt were first of all through working classes at which certain subjects would be given out for study and discussion under the guidance of one or two of the practising architects of the city. The Society also proposed to give a few lectures during the season on special subjects of interest and a source of information to the members and to the general public. The first might be called the selfish part of the programme and the second was perhaps the unselfish part. The working classes had been already formed. There was a very good attendance, while the enthusiasm had been most gratifying. They hoped by the end of the session to have an exhibition.

Mr. Blanc, who was received with applause, said he had assented to the request to be present because he was glad of the opportunity given him to offer his congratulations on what he viewed as an important and valuable step on the part of local practitioners. Such a step as this was a recognition among them of the dignity of their profession, of its claims and of the responsibility attaching to those entering its ranks. He ventured to predict for them a share of the luck which, it was anticipated, must belong to all ventures conceived in this the-

great year of Jubilee. He wished them success for the sake of those launching the Association, as well as for those who might arise to attach themselves to it. Without presumption, he felt constrained to add that he was sure theirs would be cordially welcomed as an addition to the group of similar associations. There could be no doubt that the banding together of members of the same profession tended to the maintenance of professional etiquette. Yet he would remind them that, with all the advantages accruing to such associations, their influence for good was weakened unless there was a recognised freemasonry, a fraternal and confident co-operation among its members. He wished to lay before them, as a young Society, a few thoughts upon the interests of their profession, and indicate how best they could aid in promoting these. The past was that out of which the future grew, and any efforts towards progress which did not recognise the value of that part was unreliable. He desired to impress upon them that the enthusiasm of their beginning should be maintained as much as possible throughout their Association, and that, as life progresses, the Association should be proved a perennial by a constant springing up of new actors as the old actors subsided in the restfulness of autumnal repose. Such an Association as this should be raised upon the concrete of a fraternal communion with a superstructure of unaffected love for the profession. Love was their keynote. Another requisite was devoted study towards knowledge, but it must be patient, persistent and consistent. All knowledge acquired would never make an artist, but it would at least prevent the errors and anachronisms which betrayed the untutored hand. To Ruskin's mind there were two qualities which distinguished great artists—imagination and industry. Imagination was a high gift, though it could not be boasted that many artists possessed it. But industry had promised to it great rewards, and its exercise was within the power of all. What concerned them in this Association was the manner in which it could be made helpful primarily to young members of the architectural profession, and also to the public who interested themselves in art matters. There was no knowledge which would not be useful to the architect, but it was not intended that an architect should be expert in all. He should, however, have such experience of all branches that in the interests of the public, he, calling himself an architect, should prove himself competent to design a building which would at least be sound in construction and healthful, without extravagant waste of material. Architecture was a definite art, much more so than her sister arts of painting and sculpture. It was in the decoration of the forms of the building that the art was expressible. How were all the requirements to be most readily attained by the student? The only way was, first, by a course of well-directed study; and, second, by concurrent office practice during a specified number of years. He recommended five years at least. Mr. Blanc then reviewed the system of teaching on the Continent. Looking at home they found an absence of anything like State aid, and the burden was, in consequence, laid upon communities to establish, either by private enterprise or congregated effort, the necessary ateliers and larger schools where such instruction as was required by the architectural student might be obtained. The actual defect of their system was the too great ease with which one could enter the profession, take three or four years at very mechanical work in an architect's office, and without official study of any kind commence the commercial pursuits of an architect. With all the machinery in schools of art for training students there was still an important requisite wanting. There should be some form of test at the close of a youth's ordinary school education, from the result of which a direction might be given him as to that labour of life for which he indicated most fitness. An Association of this kind should exist primarily for instruction. It should be a nursery and training room for all entering the profession. Dealing with what should be their objects of study, he said the best subjects were to be found in the past. These designs, however, should be studied and not merely copied. Lectures, &c., should be systematically pursued, and every encouragement should be given to outside measuring and sketching. In this connection they should make the camera their friend. The student, also, must not overlook his opportunities in gaining office practice. The great difference between the British system and that pursued on the Continent was that instead of being too academic they had joined the practical with the academic. His care in the office should be to become a great draughtsman. In his early years of office work he should jealously guard himself against slovenliness. In architecture there should be a balance of light and shade as much as in the work of the sculptor or the painter. An architect's best help towards a satisfactory design was his first carefully finished drawing. He strongly advocated a careful study of perspective. Concluding, he gave advice as to examinations.

On the motion of Mr. David Smart, seconded by Rector Chambers, Mr. Blanc was accorded a cordial vote of thanks.

Mr. Blanc, in acknowledging the compliment, recommended the formation of an architectural library, and presented the Society with the first and second volumes of the "Edinburgh

Architectural Sketchbook," expressing the hope that it would be the nucleus of a very interesting collection.

The Chairman, on behalf of the Society, thanked Mr. Blanc for his valuable gift.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

THE monthly meeting of this Society was held at the School of Art last week, when there was an unusually large attendance. The president (Mr. R. W. Fowler, F.S.I.) was in the chair, and among those present were Messrs. C. Hadfield, E. M. Gibbs, C. J. Innocent (hon. secretary), Joseph Smith (vice-president), T. Winder, J. T. Wheen, E. Winder, jun., W. J. Hale, C. B. Flockton, A. H. Holland, C. F. Longden, H. W. Lockwood, H. L. Paterson and C. Gibson. The following new members were elected as associates:—Arthur Appleby (student), Frank Barker (student), Henry W. Beale, John H. Chorlton, Sydney L. Chipling (student), Joseph W. E. Clayton (student), Herbert Ogden, George E. Turner (student).

Mr. J. A. Gotch, of Kettering, delivered an interesting lecture on "Eighteenth-Century Architecture," which was amply illustrated by numerous photographs of buildings, with plans and details, and limelight lantern slides. The lecturer said the view of architecture taken in the eighteenth century was very narrow, being little more than a consideration of the five orders. Neither Evelyn nor Addison had the slightest sympathy with Gothic work, and they may be taken to represent the cultured feeling of the age. The Renaissance had now developed to such an extent as to produce little more than copyism of Italian buildings without suitable adaptation to English wants. Architectural design was amateurish and artificial, and its professors were far behind the great masters, Inigo Jones and Wren, in ability. The large houses, of which many were built for great nobles, were devised for display rather than comfort. The State apartments were large and magnificent, and the exteriors were stately and striking, but the family apartments were tucked away as best they could be, without regard to the first principles of house planning. The smaller houses, however, were much more pleasing, and there are few towns which do not possess specimens of the Queen Anne or Georgian house, simple and appropriate in design and marked with enough character to render it interesting. The interiors of these smaller houses are generally well treated, and the woodwork of the period still furnishes abundant hints to designers of the present day. One inheritance we have from that time which alone would render it memorable, namely, the sash window. A cordial vote of thanks to the lecturer was moved by Mr. J. Smith, seconded by Mr. C. Hadfield, supported by Mr. C. J. Innocent and carried unanimously. The next meeting will be on December 14, when Mr. F. R. Farrow will lecture on "The Warming of Public Buildings."

THE ARCH IN ROMAN ARCHITECTURE.

IT cannot be denied that the arch, although a very beautiful feature, was employed by the Romans to such excess as rather to occasion monotony than to contribute to variety of design; for if the general character of Greek temples was invariably uniform, presenting in the exterior merely lines of columns, the amphitheatres and similar works of the Romans consisted only of continuous tiers of arches, which constituted their more strongly marked features, the columns placed against their tiers being merely ornamental accessories and comparatively of little effect, and even that not of the very best kind. In either case—the Roman or the Greek—a single compartment of an edifice, whether arcaded or colonnaded, serves as a pattern for the whole; and although uniformity and continuity conduce to grandeur, yet if precisely the same kind of uniformity recurs in every building of the same class, it becomes wearisome. In this respect Gothic architecture is far more favourably constituted than either Grecian or Roman, for it admits of infinite diversity of expression, where that of the general design is nearly similar to other buildings. There was one class of structures, however, which, though consisting uniformly of arches and piers alone, was eminently impressive and picturesque, namely, the Roman aqueducts, works of extraordinary grandeur, if estimated by their prodigious extent and the colossal massiveness of their construction, but not otherwise entitled to be termed magnificent, their architecture being in the plainest and severest style. In these there were sometimes two or even more tiers of arches, at others only a single one, as in that at Metz on the Moselle, which has exceedingly lofty arches, or, to speak more correctly, arches on exceedingly lofty piers, divided by offsets into three stages, the effect of which is no less advantageous than it is uncommon.

NOTES AND COMMENTS.

THE difficulty about the annual exhibitions of French art in 1898 and 1899 appears to be overcome. M. BOUCHER, the Minister for Commerce and Industry, has devised a scheme which is accepted as satisfactory. The immense Machinery Hall in the Champ de Mars will be assigned to the two societies of artists. The lighting of the hall is almost too perfect, for it will be difficult to conceal defects in pictures and statues, or to ascribe them to causes which the artists could not control. But the adaptation of the hall for the exhibition of paintings will be costly, and the Minister has arranged that a sum of 12,000*l.* chargeable to the International Exhibition of 1900 is to be applied to the works. The hall will be divided into two parts, one for the Salon des Artistes Français, the other for the Société Nationale. The central part will be occupied by the sculpture in both, and a number of small salons will be arranged for the pictures on both sides. There will be separate entrances to the two exhibitions, with pay places at each. After a couple of months' experience the members of the two societies may be persuaded that union is force, and it is time to abandon the rivalry between them.

THERE is a characteristic passage in Mr. RUSKIN'S "Bible of Amiens" relating to St. MARTIN, whose gift of half his short soldier's cloak to a beggar was at one time a stock subject for painters. The saint's charity was not confined to the sharing of garments, for, according to Mr. RUSKIN, "he is the patron of honest drinking, the stuffing of your Martinmas goose is fragrant in his nostrils, and sacred to him the last kindly rays of departing summer. His name is named over new shrines innumerable in all lands; high on the Roman hills, lowly in English fields. St. AUGUSTINE baptized his first English converts in St. Martin's Church at Canterbury, and the Charing Cross Station itself has not yet effaced wholly from London minds his memory or his name." But it is in Tours the power of the memories of the soldier-bishop's good deeds is still most active, and this week the Touranians appear to have been as zealous as their Mediaeval ancestors in commemorating him, for this year happens to be the fifteenth centenary of a man who, according to Mr. RUSKIN'S, notion, was "an extremely exemplary saint." The pilgrims were able to see the completion of one of the most important works of restoration undertaken in France, and for which M. LALON was architect. For the name of St. MARTIN has not saved the older of the cathedrals from repeated destruction. The original church was erected by PERPETUAS in the fifth century above the tomb of the bishop. It was rebuilt in the eleventh century, but apparently in the apse the old arrangement was preserved. Many alterations were afterwards made, and it is said that the English HENRY V. laid out much money upon the building. In 1796 there was a fire, which was caused by the Revolutionists, and of the immense building the two towers alone survived. During several years efforts were made to recreate the cathedral, and it now stands a stately Romanesque work, which is a memorial of the zeal of the clergy and people.

WE mentioned lately that a committee had been formed in London to co-operate with the Paris International Fire Prevention Congress. But owing to the interest taken in the subject in this country the programme of the British committee has had to be drawn up on broader lines than would have been requisite if the representation at Paris had been its only object. Whilst the business management for the Congress and Exhibition at Paris remains in the hands of the commissioner (Mr. HOARE), at his office in High Holborn, the entire work of the committee will henceforward be carried on at 1 Waterloo Place, where the necessary arrangements have been made under the supervision of the chairman of the executive, Mr. EDWIN O. SACHS. A committee and reading-room has been provided, a library is being formed, and for general meetings the lecture-room of the Royal Service Institution will be at the disposal of members. A number of valuable papers have already been promised, and the executive is undertaking various compilations, so that a start has already been made with the publications of the committee, and there is every prospect of their regular appearance.

England has lost a true Captain of Industry by the death of Sir HENRY DOULTON on Wednesday night. He had attained his seventy-eighth year, but those who knew him anticipated that so hale a man would see another decade. As the head of the firm of DOULTON & Co., he deserved to be considered as an embodiment of a kind of power that was most needed in our time. He was a representative of art as well as of science. The sanitary appliances of the firm are successful because in them principles of science have been rigorously applied, but they are graceful in form, and in many cases are adorned with surface decoration that satisfies the most fastidious. But in other branches of production art is supreme. In showing what can be made of simple materials by the hands of artists, Doulton ware was never surpassed. But it could not have been so successful without a special school of decorators, and there was no firm in England employing so many artists. Sir HENRY DOULTON was born in 1820, and belonged to a family who were long connected with pottery in Lambeth. He was trained to the craft in his youth. Sir HENRY DOULTON was a chevalier of the Legion of Honour, and besides the Albert medal of the Society of Arts, his firm gained 105 diplomas of honour and gold medals, besides 102 silver medals.

It was commonly believed when the late E. B. STEPHENS was elected an Associate of the Royal Academy that he succeeded because the Academicians supposed he was ALFRED STEVENS. Orthography was never an easy branch of learning to them, and they were pardoned as if they were children who were incurable. But it is curious to find a repetition of the mistake occurring within the last week. The *Sunday Magazine*, in an article on Exeter Cathedral, in describing the figures of the west front, says: "Mr. E. B. STEPHENS, to whose genius the Wellington monument in St. Paul's is due, tried a not unskilful hand upon the task of replacing a sorely decayed king or two." ALFRED STEVENS suffered much in his lifetime, but worse to him than any financial pressure from creditors would be the identifying of him with the Exeter sculptor or stone-cutter.

IN 1895 plans were prepared by Sir T. N. DEANE & Son for the completion of the buildings of the Church of Ireland Training College in Dublin. At that time no funds were available for the purpose. By the end of 1895, however, it was found possible to set aside the Free Home grant for building, and it was decided early in 1897 to allocate the money, which by 1898 would amount to 3,000, to the purpose of carrying out the first portion of the new work. In his last days at Kildare Place the late Archbishop of Dublin, Lord PLUNKET, who served, as on each previous occasion, on the building committee, devoted the most minute and painstaking attention to the adjustment and perfecting of the plans. He looked forward to the commencement of the work in the summer of the present year, and to its entire completion at no distant date. The archbishop's unexpected death in April put an end to all prospect of undertaking the building in 1897. This arose not alone from the paralysis which inevitably attended upon such a shock, but also from the prospects of undertaking a larger portion, if not the whole of the plans, which were held out by the fund which the Church proposed to raise to perpetuate the archbishop's memory. It is now expected that building operations will commence about Easter 1898, and there appears little doubt but that, in the first instance, the work will be carried round to the corner of Kildare Street and Kildare Place.

THE COMPLETION OF THE SOUTH KENSINGTON MUSEUM.

THE subjoined evidence concerning the plans and arrangements for the completion of the South Kensington Museum was given by Sir John Taylor, K.C.B., principal surveyor of the Office of Works, before the select committee on museums of the Science and Art Department.

Chairman (Sir John Gorst): Do you know the plans that have been prepared for a permanent building at South Kensington?—Oh, yes; I had a great deal to do with the conditions and the instructions to architects.

Are those plans in an advanced position, so that a commencement could easily be made?—The plans are partly prepared for the whole building; the order had once been given for them to be prepared, and the preparation of working drawings is considerably advanced.

If you had orders and funds you could begin the permanent building at South Kensington with great expedition?—There is nothing whatever that I know of in the way, except the final decision as to what the finishing of the buildings shall be in design and the funds.

Sir H. Howorth: How many plans are there in existence?—There were eight designs prepared in competition.

Do those plans include a design of which a part is already completed, the very fine terra-cotta building, Captain Fowkes's design?—Yes; they are all prepared with a view to that building remaining as it is.

Is Captain Fowkes's design one of those eight designs you refer to?—Oh, no; the eight designs were prepared about five years ago now.

Then Captain Fowkes's plans are entirely obsolete?—Entirely; they were not considered at all in connection with the designs.

In the proposed new plans one of these eight designs was, I believe, selected, Mr. Webb's design?—Yes.

Has that design been considered by the Office of Works?—It was not only considered by the Office of Works, but there was a committee to consider all the designs, to select from the eight designs sent in in competition.

That I know, but that is not quite what I meant. What I meant rather to ask was this: whether the Office of Works, on the plan being selected by the committee, has made suggestions and alterations, such as the removal of towers?—Yes, a considerable number of alterations have been made not only at the suggestion of the Office of Works, but also at the suggestion of the Science and Art Department, with a view to meet their requirements and make the buildings more to their satisfaction than the original design was.

Putting aside the elevation altogether, and dealing with the ground plan for a moment, was the director of the art museum, who would have to house his things in that building, consulted, as a matter of fact, about the arrangement of the rooms and the kind of galleries and the kind of lights, whether side or top-lights, and the sort of galleries which would be suitable for his collections?—I do not think any of the subordinate officers of the South Kensington Museum were consulted; I think the secretary would be consulted and he would take the opinion of all the officers of his staff; but I should have thought that the art librarian would have no voice whatever in the new building.

I refer not to the art librarian, but to the director of the art museum, who is directly responsible for housing, exhibiting and displaying his objects?—The director of the art museum has had the whole of Mr. Aston Webb's designs before him, and as I said, the original designs sent in in competition have been materially altered at the suggestion of the South Kensington Department, I take it at the suggestion, probably, of the director of the art museum.

You understand I am not asking any polemical questions at this moment. This is the point I really wish to put, that there are two theories about a museum. One is the architect's theory that the birds were meant for the cage, and the other is the museum director's view that the cage should be made suitable to the birds which it is to contain. Now, if the latter theory, which has been carried out in some museums but not in others, notably the Natural History Museum, is to prevail, it is clear that the director of the museum who has the display of the objects must be the first person to be consulted about the ground floors?—But I take it that the director was consulted in the preparation of these plans, I believe he was; of course, if you have a change of directors there may be a change of opinion.

Mr. Bartley: Were not particulars sent to the architects showing, roughly speaking, what was wanted to be provided in the new building?—Yes, to the best of my recollection.

Would not those particulars be prepared by the officers of the Department and those acquainted with the requirements of the new building?—Yes, I take it they would, in conjunction with the Office of Works.

Sir H. Howorth: With regard to the elevation of the buildings as prepared by Mr. Webb, you say they were pre-

pared with a view to make them more or less consistent with the very fine buildings designed by Captain Fowkes; are they to be virtually of the same style and of the same materials?—Oh, no; they would not be similar buildings to that at all.

Not in colour?—Well, that might be; the material has not yet been decided upon; the design would answer for either a red material or for stone.

I understand that there were some very large towers in the plans which were done away with by the Office of Works, is that so; one or two very large towers were dispensed with, possibly quite rightly?—There has been a desire to dispense with very large towers which were unnecessary, but the final plan has not yet been approved; the architect is merely proceeding with his working drawings on such portions as can be gone on with without a decision in regard to the towers. I do not think there has been a final decision yet with regard to those. There is every desire on the part of the Office of Works to avoid huge towers if they possibly can, and to make a suitable and sightly building without them.

Suppose the building was started next year; suppose we could get the Treasury to grant the money for a start, in how many years would you contemplate the buildings could be completed according to Mr. Webb's plan without putting a great strain on people?—I am assuming that when you say the buildings started you mean over the whole area of the proposed new buildings, not to begin at one corner and complete a piece and then begin again and complete another piece, but all over the site.

Quite?—I think the building ought to be completed in five years from the date of its commencement.

Had you in contemplation when you commenced, proceeding piecemeal with it, or completing the whole as a whole; did you contemplate completing some small galleries, and then adding a fresh piece again, or completing the whole as a whole; was that what you had in contemplation?—Personally, I am strongly in favour of beginning the buildings as a whole, because I think you get into difficulties where you have to join one portion of a heavy building to another portion, and the whole would be completed in a much shorter time; but there had been a suggestion to begin the south-eastern portion of the building, so as to provide additional office accommodation before the central portion. I think that would be a mistake; I should much prefer to see the whole building commenced at the same time, the whole of the foundations put in and the whole building carried up all over the site, rather than put it up piecemeal.

With regard to the plans as you have seen them, and as they are prepared, can you tell us the sort of galleries which they involve; are they galleries all of which have top lights, or have some side lights?—Some of the galleries have side lights to the best of my recollection; certainly some have side lights and top lights wherever they can be obtained.

Is it not within your knowledge that in all modern museums the existence of side lights is a thing which is very much disapproved of by everybody?—Well, for certain exhibitions I think side lights answer the purpose very well, and I should say myself that it is an extremely extravagant appropriation of a valuable site to have a large area covered with one-storeyed buildings only. It is not only an extravagant appropriation of the site, but it is an extravagant way of building; you have your roofing to put on and your foundations to go in, and you get your intermediate floor certainly at a cheaper rate, if it can be made suitable, than you would if you were to allow the building to spread over a large area only one storey high.

Does it in any way follow that you are to have only a one-storey building; surely the top lights at the museum in Jermyn Street are a most excellent way of lighting that building, and it consists of at least three storeys?—The Jermyn Street building is, in my opinion, an imperfectly lighted one.

Mr. Bartley: Is it possible to have two floors lighted one above the other with top light?—No, not to be lighted at all properly.

Sir Henry Howorth: Of course it is matter of opinion, but I spend a great many days and weeks in that museum, and I am bound to say that I know of no museum in which objects seem to me to be better exhibited than in the Jermyn Street museum.—Many of the objects are exhibited under the shadow of a wide projecting gallery.

There is a tremendous skylight, the light from which comes down on every one.—Yes, and there is a central opening through which the light passes; but all round the walls you will find, where the galleries of the floor above project, the cases are in shadow—seriously in shadow in many instances.

Have you not already in the Museum at South Kensington, in one or two very large exhibition-rooms, a gallery that runs round the building in which you virtually increase the wall space tremendously by the use of such a gallery?—Yes.

And in cases where there are no side lights at all?—Yes, it can be done; but I should certainly myself prefer to have good side lighting, to have lighting underneath the galleries of an upper storey.

When you come to economy of space, are you aware—I mention it simply as a fact that I was told by the people in charge—that in those galleries in the British Museum to which the plan of top lighting has been adapted and side lighting entirely dispensed with, it has led to an additional accommodation amounting to two additional galleries; that is, they consider they have now eight galleries instead of six?—I suppose that has reference probably to the newly-invented system of hanging book cases.

No, it is the additional wall space obtained by closing up the windows and making continuous wall cases all round the walls that has given them additional space of one-third more, a set of eight galleries instead of six?—But the rooms in that case are only one storey high; that is to say, they are top lighted from the ceiling to the floor, and they have cases constructed with iron galleries round them; but that would not answer the purpose in South Kensington Museum where you have to exhibit objects; at the British Museum they are mostly for books, I think.

No, pardon me; the galleries I refer to are the Egyptian Galleries and the Babylonian and Assyrian Galleries, which until recently were lighted only by side lights with great windows; those windows within five years have all been bricked up and closed up, and the top light is now the only method of lighting it, and they are adapting the same thing to every gallery in the museum where it is possible, and the walls are surrounded with fixed wall cases, and every mummy and every object in the Egyptian room which is not in a table case is now exhibited in these side cases?—I know these rooms perfectly, because I am doing all the alterations that are being made in them. The rooms are precisely the same as this room may be said to be, with a top light upon it. The windows were in the sides. We now have bricked-up the whole of the windows, and got the whole of that in wall space; but the room is only one storey high—that is to say, the skylight only lights the floor and the walls surrounding it. No doubt they have got additional wall space, but there is no light passing through the first floor upon which the light from the skylights strikes; it simply lights that room and that floor alone, and no more.

You get two storeys, one with top lights and one with side lights, in the British Museum by this method; the upper storey all through will presently have nothing but top lights.—That would be so.

Would that be an advantage in your buildings at South Kensington?—That is precisely what I think there would be; there would be a portion of the exhibition space lighted by side lights and as much as possible by top lights.

Are you responsible for making any of the cases at South Kensington?—No, not in the Science and Art Department.

Only the buildings?—I made the whole of the cases for the Natural History Museum, and I did the whole of the internal fittings of that building myself.

In your opinion would it be an advantage if the Office of Works made the cases for all the museums as it does for the British Museum; it does so for the British Museum?—The British Museum provide the funds, but I carry out their works of any importance for them. All their works in important exhibition cases I carry out for them.

Their furniture and cases?—Yes, all the exhibition cases and furniture of a special character.

Are there any public buildings whatever in which the Office of Works does not provide the furniture and make them except the Science and Art Department?—I do not remember any other building at present.

It is the only one?—Yes. I may be omitting something, but at the present moment I recollect none, except the Science and Art Department.

In making your cases are you dependent in regard to the most novel way of making them, the most safe way of making locks and excluding dust, entirely on suggestions from the staff at the different museums, or have you means of knowing what is going on in foreign museums?—I have a proper staff of my own constantly engaged in such work.

And you could undertake the South Kensington work without any difficulty if it was thought proper?—The South Kensington work is not nearly of such an extensive character as the British Museum and the Natural History Museum.

I do not quite follow you; is it more expensive to have these fittings made by the Office of Works than it is by a staff working it as they do at South Kensington?—I think not, because I have all the cases that are made for the British Museum and the Natural History Museum tendered for; I make complete sets of drawings and specifications and obtain tenders.

If this work was done by the Office of Works you think it would be done quite as economically as it is done now?—Well, I cannot for a moment suppose that having cases made on the spot could be an economical proceeding; I cannot imagine such a thing, certainly not if they were cases anything like what I have to make for the British Museum and the Natural

History Museum. Speaking of the constructing and dust-proofing of the cases, I am responsible entirely for the change in the mode of construction of all the cases in the Natural History Museum. They originally had them all made of gun-metal, and the estimate was so enormous for the fitting-up of the Natural History Museum in gun-metal cases that I set to work to produce a composite case in which the woodwork was reduced below what wood would stand in itself, but I combined metal with it.

Do you think that is as effective for excluding dust as a metal case?—Quite as effective, and at a very considerably reduced cost.

Are those cases you refer to all opened from the front, or are some opened from the back?—Some of them open from both sides, both front and back; some are double-sided cases, into which you can get from doors on either side.

You are aware that in some recent foreign museums, Vienna and elsewhere, the cases are never opened from the front at all now, but are opened at the back; there is a little narrow gallery runs along the back, and they are opened from the back?—I do not think with the construction which is adopted now it makes any difference which side you open the door from; they are absolutely dust-proof.

Do you approve of glass ceilings to the cases?—That is more a matter for the heads of the exhibiting Departments; sometimes they like the light down through the tops of the cases, and in other instances they like to have the light from the side; it depends on the object to be exhibited.

With regard to safety of another kind, do you think it is better to have cases with thick glass for exhibiting objects of great intrinsic value or to have iron bars; I have in view one department of the South Kensington Museum especially?—Well, the whole of the glass I use is plate, and plate glass is not readily cut with a view to theft.

What is the thickest glass you used in any exceptional case?—I endeavour to get it as thin as I can; it is the thinnest British plate I can get, running down to about quarter of an inch thick.

Is that safe if you are exhibiting gold objects of great intrinsic value in a very small space?—It is not safe if you take a hammer and break the glass, of course, but I have known of no instance where that has been attempted. The question is making a thing practically safe against theft with the attendants in the room.

You would prefer that to having cases with bars as they have for the regalia at the Tower, for instance?—That is an entirely different thing.

I am only speaking for very special parts of the exhibition; very valuable and very special parts?—That would be a question for the custodians rather than for me.

Lord Balcarras: I wish to ask you a question or two about these plans you have been talking to us about; I understand you, yourself, have made plans, have you not?—I made plans for the completion of South Kensington Museum in 1883, a complete set of plans.

Am I correctly informed that in these plans special care has been taken to design an economical building, that is to say there are no very large towers, or minarets, or pinnacles in your building, compared with those towers and so forth in some of the plans which have been made later on?—I had no great central towers; I had a central feature, suitably finished with terminal towers, but they were of no great height.

You had no great central tower?—No, I had no actual central tower.

Is it also the case that in this particular design you made the exhibition rooms were arranged in such a manner as would make it possible for them to be supervised and watched by a minimum number of constables, by having the rooms so far as possible opening one into another?—I think in the designs I made the galleries were more continuous than they are in the designs which have been made more recently; they were on a larger scale.

In your designs the ranges of galleries were more considerable?—Yes.

I suppose, in fact, it is a truism, is it not, that in that case an economy could be effected in watching?—It would certainly reduce the number of attendants.

Is it not a fact that one policeman can look after the Venetian Room in the National Gallery, and that one policeman could not look after six or eight small rooms, altogether in the aggregate smaller than the Venetian Room?—No doubt the watching is made more difficult with a large number of small rooms than if you have continuous galleries.

I wish to ask you one more question about the alterations you stated had been made or suggested in the new plans. What alterations were made or suggested?—A considerable number of structural alterations were suggested by the museum authorities, and their requirements were all met to their satisfaction by Mr. Webb.

What kind of things?—Provisions for certain people, not included in the original drawings, were suggested by the South

Kensington authorities and included in the plans; such alterations as that.

Do you mean new offices for clerks and that sort of thing?—They might be for attendants or for clerks.

But it was chiefly with respect to offices and so forth?—Well, not wholly; I think there were suggestions made with regard to the improvement of the exhibition space.

Were suggestions made, for instance, in some of those more decorative schemes that towers should be knocked off and so on?—I think that is very likely.

Do you consider it quite fair to the architect that he should send in a design for competition, that that design may possibly be accepted and receive a prize, and that then his design should be submitted to those persons who will perhaps have to find or account for the money, and that they should knock off the ornamental features on his plan in order to save money; do you think that is fair on the architect?—I do not think it is fair to the architect, unless the alterations meet with his entire concurrence.

Do you mean to tell the committee that Mr. Webb was satisfied when it was suggested that the towers in his design should come off?—I have not said so.

Can we assume that he was satisfied?—He was satisfied with regard to the arrangement of the plans, but I think I stated in my reply to the question that the external design of the building had not been finally approved; he was engaged on the plans and not on the features of the elevations. I do not think he has now got further than the plans and sections of the main buildings; I do not think the towers have been touched for the moment.

At one time it was commonly said, I only give it as a rumour, that objection was taken to the towers on account of the expense, and that we might, it is of course a few years ago, expect to see Mr. Webb's building made minus the towers?—It may have been said, but I for one should certainly not desire an architect who has gained the first position in a competition to mutilate his buildings beyond what he thought he could do with absolute propriety.

I am glad to gather from you that that is not the case. There is just one more question, and that is, was it your office that paid the architect's fees in this case?—Oh, yes.

Dr. Farquharson: I understand there are three sets of plans which have been prepared for the extension of the South Kensington buildings: first Captain Fowkes's, then your own, and finally this last set which are now under consideration?—Yes, in the case of the competition there were eight sets prepared, but it is as you say, there have been three sets of plans prepared.

By what is called limited competition, does that mean limited to a certain number of people who are invited to compete?—The architects in the competition were selected—four by the First Commissioner of Works and four by the Royal Institute of British Architects.

Sir H. Howorth: May I intervene one question. Could you tell us how it was that Captain Fowkes's plan was not carried out?—No, I cannot say anything about that.

Or why was it withdrawn?—I cannot tell.

And your own?—My own never was put before the Government.

Dr. Farquharson: Have the last set of architects ever had an opportunity of studying the plans prepared by their predecessors, so to speak?—Yes, they have had an opportunity of studying everything connected with the subject, and were informed as to the requirements, as far as they could be so informed in a case of this kind.

I understand there are two sets of plans—one for the Art and the other for the Science Department?—Yes.

Has the same architect carried out both of these?—No; the drawings for the Science Department have not yet been finally made. I have made myself a set of plans for the Science Department on the western side of Exhibition Road, but no steps have been taken for carrying those out, and in all probability before any buildings to such an extent as they would be were carried out on the south side of Imperial Institute Road, that would probably be the subject of another competition, I should say, amongst distinguished architects.

If you were asked to say which was the more urgent case to be carried out immediately, the Art extension or the Science extension, which would you say?—That is a question on which I am not prepared to give an opinion; it must rest with the authorities at South Kensington, who know the requirements much better than I do.

You know the way in which science teaching has necessarily got to be carried out now at South Kensington, and the cramped accommodation provided for it?—There is no doubt that the accommodation provided for the science branches is extremely poor at present; they are all in temporary buildings, with the exception of the building which was erected by General Scott, on the east side of Exhibition Road.

Have you got a plan which you think would be sufficient for the purpose of scientific teaching?—I should think about three

years ago we asked for information as to the requirements of the Science Department, with the view of ascertaining the size of the site required and approximately what would be the cost of meeting all the requirements, and that was the object I had in view when I prepared drawings for the western side of Exhibition Road.

Mr. Bartley: As regards the buildings that have been erected, is it not the fact that Captain Fowkes's was a general plan for covering the whole ground more or less?—I believe it was to a certain extent.

Was not a certain part of it really carried out by him and afterwards by General Scott?—Yes, a certain part.

And was not the idea then that his general plan would gradually be completed?—I am not at all sure that his plan was adhered to; on the contrary, I think it was not.

You mean after his death?—After his death.

General Scott altered it?—Yes, I think it has got away entirely from what was the original intention.

But a general plan was adopted by him and accepted by the Government, was it not?—Certainly, for all the central exhibition portions of the building.

Was it not laid before a committee of this house?—That is very likely; I do not remember.

You said the temporary buildings are not satisfactory; is it not probable that if there had never been any temporary buildings at South Kensington there would never have been a museum there at all?—That I cannot say.

Do you not think it is extremely likely that the Treasury would never have agreed to begin one large building?—I am not in a position to answer that question.

As regards the fireproof roofs, would there be any practical difficulty in really making all the roofs at South Kensington fireproof?—No practical difficulty.

Would it be a very costly thing to do?—Very.

What do you mean by very costly, would it run into a very large sum?—Yes, a very large sum.

Is not the idea of a fireproof roof comparatively modern?—Yes.

Is any great part of the British Museum fireproof in the roof?—Not what I should call a fireproof roof, no.

Is it not really a fact that the idea of these fireproof buildings has very much developed in the last few years?—Yes, very much indeed. In fact, one could hardly point to any roof over a public building which was absolutely fireproof until quite recently.

Then we are really condemning those who built South Kensington because they had not the knowledge of the present day?—In the case of some of the roofs, the fireproof floors having been placed in the building, the roofs ought not to have been of the construction they are; they are absolutely all wood, some of them.

Too cheap?—Too cheap.

The Raphael Gallery, is that your ideal of a fireproof roof?—Yes, I put that roof on, and I did the very most I could to avoid inflammable material.

Is there any improvement since that?—No, everything of course depends on the form which the roof must take. There is no difficulty in making a fireproof roof if you have not to get the light and ventilation through it, that is perfectly easy, but in a roof that requires so much glass in it as the roof of the Raphael Gallery has, the construction has to be of a special character to make it fireproof.

That would be the case nearly all over the museum, would it not, a great part of it at any rate?—Yes, it would.

Have you any idea of the cost of putting a fireproof roof all over the present buildings of the museum?—I have made no estimate, but if I had to give an opinion I should say that it would be from 50,000*l.* to 100,000*l.*

To do the roofing of the existing buildings?—Yes.

Do you know at all what the Raphael Gallery cost?—Yes, it was between 3,000*l.* and 3,500*l.* I think.

Sir Francis Powell: Are the plans for the completion of the museum now complete or nearly complete?—No, the progress with regard to the plans has been stopped, because we have no funds forthcoming.

What advance was made up to the time that stoppage took place?—Instructions had been given by the Office of Works to the architect to proceed at once with the working drawings for the completion of the building or a portion of it; I think the eastern portion of it was what was ordered with a view to the extension of the offices. These plans were proceeded with to a certain extent, and then further instructions were given that the matter must remain in abeyance for a time.

Referring to the present time there are no plans for the completion of the museum in an advanced state?—No working or contract plans, I should call them, are complete.

Before you make your contract or working plans for a building you generally feel bound to settle the general conception of it and the plans, so as to be understood by an ordinary person?—Yes, such plans are complete; the designs are complete.

And all that remain are the working drawings?—That is all.

Chairman: And some of those are ready?—They are not ready, but they had been proceeded with to a considerable extent before the order to cease was given.

Sir Francis Powell: All that remains to be done is to complete what I may call the technical part of the work?—That is really all.

The architectural sections, for example, in detail?—Yes, all the plans must be made; the plans, sections and elevations, in order that the quantities may be prepared and tenders obtained; that is the process.

You consider that the plans for their present stage are finally settled?—The plans were considered to be finally settled, and settled to the satisfaction of the Science and Art Department; the elevations have not been finally settled, that is to say, such portions of the elevations as the towers; but the general elevation is, I think, practically agreed upon.

Have they been settled by the highest authority, the Treasury?—The Treasury, in a case of that kind, would leave the settlement of the plans to the First Commissioner of Works, subject, of course, to their being prepared with a due regard to economy.

Do you think the matter has so far advanced that the terrible veto of the Treasury will not be exercised?—At present we are making no progress; nothing is being done just now.

You cannot say that the plans have been finally passed by the Treasury, using the word "plans" in the limited sense which I used just now?—No; the working drawings, when complete, would be put before the Treasury, with an estimate of the cost; that, as yet, has not been done.

The Treasury may even yet be alarmed by the magnitude of the figures?—Perhaps they may.

Do you consider the omission of the towers will gravely injure the design?—The complete omission of the towers would seriously mutilate the design; but it is just possible that some middle course may be found practicable to the satisfaction of the architect.

I believe Sir Gilbert Scott was never satisfied with the mutilation of his buildings of the Foreign Office?—No, he was not quite satisfied with it; but his original design for the Foreign and Home and Colonial Offices was a Gothic one.

But still, I never heard that Sir Gilbert Scott was ever satisfied with the elimination of his towers?—No; but I think the elimination of the towers in that case as originally designed was certainly a success.

Do you think that would not also apply to Mr. Webb's towers?—Mr. Webb's towers are very different from those which were shown on Sir Gilbert's drawings for the Whitehall front.

Were they less ambitious?—No, but much more suitably applied in regard to proportion.

Do the plans—which I may say have been provisionally approved—involve the omission of any administrative department?—No; to the best of my knowledge the Science and Art Department very fully considered the plans in every respect, and I have every reason to believe they were satisfied with them as they finally left them.

If ever any change was made in the administration, the plans would probably have to be altered?—Yes; there is no saying what the views of other chiefs of the Department might be if there were any change.

I understand you as expressing a decided opinion in favour of the completion of the museum at the earliest possible period?—Well, I think we have all been agreed that the completion of the museum buildings sooner or later is a necessity; and having made the progress which we have made in regard to obtaining designs by competition, and a selection having been made, it seems to me a pity not to proceed with the completion of the buildings as shown by the approved drawings.

Then I may take it, if I may put such a question, if there be fault at all in the matter, the fault does not lie with the Office of Works?—No, the Office of Works have been quite prepared to carry out any instructions they may receive.

Have they been anxious to receive such instructions?—We should have been very glad to have received such instructions.

You have excluded from the answers which you have given to me all questions about the western parts of the buildings.—I understand that subject is not before us in any way.

ROMAN ORDERS OF ARCHITECTURE.*

(Concluded from last week.)

NEXT in the regular order of their classification comes the Roman Ionic order. This too, like the Roman Doric, was borrowed from the Greeks and then altered to suit the tastes or whims of the Romans. The Romans were much more unfortunate in their modifications of the Ionic order than those which they introduced into the Doric. They never seemed to have liked or understood it, nor to have employed it except between the Doric and Corinthian. In its own native east this order had originally only been used in porticoes between piers or antæ, where of course only one face was shown and there were no angles to be turned. When the Greeks adopted it they used it in temples of Doric form, and in consequence were obliged to introduce a capital at each angle with two voluted faces in juxtaposition at right angles to each other. In some instances they used a capital with four faces.

The Romans, impatient of control, eagerly seized on this modification, but never quite got over the extreme difficulty of its employment; with them the angular volutes became mere horns, and even in their best examples the capital wants harmony and meaning. When used as a three-quarter column these alterations were not required, and then the order resembled more its original form; but even in this state it was never equal to the Greek examples, and gradually deteriorated to the corrupt application of it in the Temple of Concord in the Forum, which is the most degenerated example of the order now to be found in Roman remains. The only existing example of Ionic in Rome in which the columns are insulated is in the Temple of Fortuna Virilis, for the Temple of Concord is too barbarian to deserve consideration.

Its stylobate, like that of the Roman Corinthian, is lofty and not graduated, having a moulded base and cornice or surbase. In the column the base consists of plinth, two tori, a scotia and two fillets; the shaft has twenty fillets and twenty flutes and diminishes one-tenth of a diameter; the capital is two-fifths of a diameter in height; the volutes, however, dip a little lower, being themselves about that depth without the abacus; the corbelling for the volutes is formed by a bead and large ovolo, the latter being carved. A straight band connects the generating line of the volutes, whose ends are bolstered and enriched with foliage and a square abacus moulded on the edges covers the whole.

In the entablature the architrave is unequally divided into three fascias and a band consisting of a cyma-reversa and fillet; the lowest angle impends the upper face of the shaft of the column. The frieze is in the same vertical line and is covered with a fillet which receives the cornice; it is also enriched with a composition of figures and foliage. The cornice consists of a bed-mould two-fifths of its height and a corona with crown mouldings. The cymatium is enriched with acanthus leaves and lions' heads, and the mouldings of the bed-mould and architrave band are carved. The soffit of the corona is hollowed out in a wide groove, whose internal edges are rounded off in a cavetto, but without ornament of any kind, forming indeed a mere throating. Like the angular capitals of the Greek Ionic, the external volute of this is turned out and repeated on the flank; either that or the abuse of it in the Composite capital gave rise to the distortions of the order, in which all the volutes of the capital are angular, and consequently all its four faces are alike.

In other respects, it does not differ generally from the ordinary examples of the Roman Ionic. The Temple of Fortuna Virilis is pseudo-peripteral, and consequently has neither antæ or pilasters, nor do ancient examples exist of either.

The proportions of the Roman Ionic are about the same as those given for the Grecian Ionic. The architects of the present day generally prefer the Greek to the Roman form, hence very few examples of the Roman Ionic are now being executed.

The next order, according to the popular classification, which demands consideration is, as its name signifies, called Composite, and may be regarded as a genuine Roman order—in fact the only order of architecture that the Romans gave to the world. The ancient examples of this order do not differ so much from the ordinary examples of the Corinthian order as the latter do among themselves, except in the peculiar conformation of the capital to the column. In other respects, indeed, its arrangement and general proportions are exactly those of the Corinthian.

The Composite order was used in triumphal arches and in the best ages of Roman architecture in them alone. The difference in the capital consists in the enlargement of the volutes to nearly one-fourth of the height of the whole capital, and in the connecting of their stems horizontally under the abacus, giving the appearance of a distorted Ionic capital. The central tendrils of the Corinthian are omitted and the

A Decree was unanimously passed by Convocation at Oxford on Tuesday, authorising the Drapers' Company to erect a new building for the Radcliffe Library, on a site facing the South Park's Road, and constituting a wing of the museum corresponding to the Clarendon Laboratory, from designs from Mr. Jackson, R.A.

* A lecture by Mr. Cyrus K. Porter, published in *Stone*.

drum of the capital is girded under the stem of the volutes by an ovolo and bead as in the Ionic. Acanthus leaves in two rows fill up the whole height from the hypotrachelium to the volutes, and are consequently higher than in the Corinthian capital. This difference is given to the upper row.

The greatest defect of the Corinthian capital is the weakness of the small volutes supporting the angles of the abacus. A true artist would have remedied this by adding to their strength and carrying up the fulness of the capital to the top. The Romans removed the whole of the upper part and substituted an Ionic capital instead. Their only original idea of it was that of putting two entirely dissimilar things together to make one which should combine the beauties of both, though as a rule the one generally served to destroy the other.

In the Composite capital they never could hide the junction, and consequently, though rich, and in some respects an improvement on the orders out of which it grew, this capital never came into general use, and has seldom found favour except among the blindest admirers of all that the Romans did.

The only place where a modern architect could with propriety introduce the Composite order would be in a façade composed of several superimposed orders, in which case it might be placed above the Ionic or beneath the Corinthian order.

The proportions of the Composite are quite the same as those of the Corinthian order; if anything, perhaps, it is a little heavier, and its entablature more highly enriched with carving.

Besides the Composite order, as already described, the Romans made many other compositions or combinations. In some of these, animals of different species, the human figure, armour, a variety of foliage and other peculiarities are found. Shafts of columns are also sometimes corded or cabled instead of being fluted; those of the internal order of the Pantheon are cabled to one-third their height, and the flutes of the antæ of that ordinance are flat eccentric curves.

There are fragments of others in which the fillets between the flutes are beaded, some in which they are wider than usual and grooved, others again whose whole surface is wrought with foliage in various ways, and it would be no less absurd to arrange all these into different orders than to make a distorted and hybrid capital the groundwork of an order.

The last of the Roman orders to which your attention is invited is called the Corinthian. The prototype of this order is to be found in the Grecian order of that name, the most perfect example now remaining being that of the Choragic monument of Lysicrates at Athens, a description of which was given in our paper on the Grecian orders of architecture.

The fate of the Corinthian order at the hands of the Romans was quite different from that of the Doric and Ionic orders. These orders had reached their acme of perfection in the hands of the Grecian artists, and seem to have become incapable of further improvement. The Corinthian, on the contrary, was a recent conception, and although nothing can surpass the elegance and grace with which the Greeks adorned it, the new capital never acquired with them that fulness and strength so requisite to render it an appropriate architectural ornament. These were added to it by the Romans, or rather perhaps by Grecian artists under their direction, who thus produced an order which for richness combined with proportion and architectural fitness has hardly been surpassed. The base is elegant and appropriate, the shaft is of the most pleasing proportion, and the fluting gives it just the requisite degree of richness and no more; while the capital, though bordering on over-ornamentation, is so well arranged as to appear just suited to the work it has to do. The acanthus leaves, it is true, approach the very verge of that degree of direct imitation of nature which, though allowable in architectural ornaments, is seldom advisable; they are, however, disposed so formally and there still remains so much that is conventional in them that, though perhaps not justly open to criticism on this account, they are nevertheless a very extreme example.

The entablature is not so admirable as the column, the architrave being too richly carved. It is evident, however, that this arose from the artist having copied in carving what the Greeks had only painted, and thereby produced a complexity far from pleasing.

The frieze as we now find it is perfectly plain, but this undoubtedly was not the case when originally erected. It either must have been painted (in which case the whole order was also painted) or ornamented with scrolls or figures in bronze, which may probably have been gilt.

The cornice is perhaps open to the same criticism as the architrave, of being over-rich, though this evidently arose from the same cause, viz. reproducing in carving what was originally only painted, which to our eyes at least appears more appropriate for internal than for external decoration, though under the Italian sky, where it was introduced and used, the conditions may have warranted its use.

There are at least fifty varieties of Corinthian capitals to be found either in Rome or in various parts of the Roman Empire

all executed within three centuries, during which Rome continued to be the imperial city. Some of them are remarkable for their elegant simplicity, which so evidently betrays the hand of a Grecian artist, while others again show lavish exuberance of ornament which is but too characteristic of Roman art in general.

Like the Greek orders the Roman Corinthian may be said to consist of three parts—stylobate, column and entablature; but unlike them the stylobate is much loftier and is not graduated, except for the purpose of access before a portico. Its usual height is not exactly determinable in consequence of the ruined state of most of the best examples, but it may be taken at from two and a half to three diameters. In the triumphal arches the stylobate sometimes amounts to four and even to five diameters. It is variously arranged, however, having in the shallower examples simply a series of mouldings to form its base, with perhaps a narrow square member under it, a plain dado, and a covering cornice or coping on the top of which the columns rest. In the loftier examples a single and sometimes a double plinth comes under the base mouldings, and a blocking course rests upon the coping to receive the bases of the columns.

The column consists of base, shaft and capital, and varies in height from nine and a half to ten diameters. The base has usually, in addition to the series of mouldings, a square plinth whose sides are vertical; this with the whole height of the mouldings is about half a diameter. The spread of the base varies from a diameter and a third to a diameter and four-ninths; in the best Roman examples, as well as in the Greek, the shaft diminishes with entasis, the average diminution being one-eighth of a diameter. The shaft was always fluted when the material of which it was composed would permit.

The Romans often used granite and sometimes an onion-like marble for the shafts of their columns, the former of which could not be easily wrought and polished into flutes, and the latter would scale away if cut into narrow fillets. Like the Greek, the Roman Corinthian had twenty-four flutes and fillets; the flutes are generally semicircles, and they terminate at the bottom and top in the same form.

The hypotrachelium is a plain torus or bead resting on a fillet above a cavetto at the head of the shaft. The ordinary height of the capital is a diameter and an eighth. (There are some very fine examples in which the capital is only a diameter or even a little less.) It is composed of two rows of bands of acanthus leaves consisting of eight leaves ranged side by side, but not touching; of helios and tendrils trussed with foliage and an abacus whose faces are moulded and variously enriched. The abacus is one-seventh the height of the capital; in plan it is a square whose angles are cut off and whose sides are concaved in segments of a circle. The Corinthian capital is in too common use to require further description.

The entablature varies in different examples from one diameter and seven-eighths to two diameters and a half in height. The entablature of the Temple of Jupiter Stator, which is regarded as one of the finest examples of ancient Rome, is two diameters and a half in height, of which the cornice occupies a diameter and a sixth, leaving to the architrave and the frieze a little less than a diameter and a half. The entablature of the Pantheon is about $2\frac{1}{4}$ diameters in height. As the above are the best examples of ancient Roman Corinthian, it is perfectly safe for modern architects in using this order to keep within the lines fixed by these examples.

We cannot close this paper without some allusion to the wonderful works executed by this truly great people. Whatever of architecture they may have borrowed from the nations by which they were surrounded, or whatever they may have appropriated from the architecture of the nations they conquered, it must be admitted that they were the greatest builders the world has ever seen.

It is claimed by some writers that Numa, the first emperor of Rome, wishing to beautify his capital city, created a body of skilled workmen to whom he gave the title of "College of Constructors." This body of men or college were to a large extent governed by laws of their own making. They owed allegiance to the reigning sovereign and to them was entrusted the execution of all public work, erections of temples, arches of triumph, walls, aqueducts, bridges and roads; that in later times the services of this body of men were held in such high esteem that a company of them was attached to every legion of the Roman army. Their duties were to superintend the construction of camps, bridges and roads; thus, wherever the Roman army marched this body of skilled men carried the art of construction and instructed the inhabitants in the science of building. Whether this be true or not, it is true that wherever the Romans established themselves and assumed the reins of government, temples of the most exquisite workmanship were erected, theatres and amphitheatres were constructed, aqueducts and baths built, and cities walled and their streets paved.

Rome borrowed her chief architectural ideas from the Etruscans and the Greeks, but what she thus took she reconstructed in accordance with her own spirit, converting the whole

into realisations of grandeur and ostentation, in response to the wants which arose from her wealth and her conquests. Roman architecture may be described as an original transformation of Greek architecture. Applying it to much larger structures, Rome introduced the superposition of orders in storeys, substituting the vault and the arcade for the ceiling and the plat-band. She employed the smallest materials, and yet enlarged the intervals between the points of support. The triumphal arches, the baths, the amphitheatres and the aqueducts widely differ in their structure from the Greek model; these are all purely Roman works.

The spectator could not walk ten paces in the ancient Forum without perceiving that he was not in Athens. Situated at the foot of the capitol it formed one of the prominent objects of ancient Rome.

The arch of Septimius Severus, erected about the year 203 A.D., in honour of Severus and his two sons, rises in front of the capitol. The edifices which enclosed the Forum on the east having fallen gives an uninterrupted view on the right of the Palatine Hill, where Augustus and Nero had their palaces and gardens. To-day it is merely a huge collection of open vaults, buried galleries and halls paved with mosaics.

Titus built the Flavian amphitheatre and dedicated it about the year 80 A.D.; struck with its immense proportions the people called it the Coliseum. At the inauguration under Titus 5,000 wild beasts were put to death and 11,000 on the occasion which celebrated Trajan's victory over the Parthians.

The building covered a space of 65,000 square feet and its oval arena was 260 feet long and 150 feet wide.

The baths exhibit the life of the Romans even more intimately than the amphitheatres. Of these there were in Rome more than 800 which were frequented from mid-day to evening. Agrippa, Titus, Diocletian and Caracalla, each in their order of succession, strove to excel their predecessor in the luxury and magnificence of their baths. In the Bath of Caracalla the bathers had 1,600 marble seats, special and common halls and hot and cold baths of various degrees of temperature. One of these baths was 110 feet in diameter; another measured 126 feet by 78, exclusive of the niches around the sides and the halls at each extremity. The vaulted roofs were supported upon pillars 45 feet high, one of which has been carried to the Trinity Square, Florence, where it stands surmounted by a statue in red porphyry.

In the refinements of these baths may be read as in a book the intense luxurious and delicate life of the ancient Romans. It might be well to recall these baths, which were at once public baths, restaurants, gymnasiums, promenades, libraries, halls of declamation and congresses, before we boast of our own civilisation and prosperity.

Baths were not the only wonders of ancient Rome. Trajan's column was and is one of its most beautiful monuments. For the pedestal, the shaft, the capital and the statue of Trajan, Apollodorus of Damascus, the architect, employed thirty-four blocks of marble marvellously fitted together. Throughout its whole length the column is pierced by a staircase leading to the summit. Upon the pedestal garlands of oak, symbolical of peace, were suspended. Laurels gird the base of the pedestal. The shaft is enriched with a kind of endless scroll which winds round its circumference from base to summit. Here may be seen, ascending as it were from the bottom to the top, 2,500 figures of soldiers and prisoners, with an endless number of horses, elephants, weapons and war material.

Standing on the top, the conqueror, as it were, looks down upon this triumphal cavalcade marching upwards in winding file, and is recompensed for his victory.

In all these constructions, arches, temples, amphitheatres, baths, columns and tombs, whatever was not positively enormous in size was at least solid and strong. It was the custom of the Romans to combine beauty with strength, but beauty was with them none the less an object of their efforts because they considered it should be combined with utility. They may be said to have chosen by instinct outlines, curves and elevations that pleased the eye, a custom from which modern architects might learn a useful lesson.

While Rome drew to herself all the wealth and the active forces of the countries she conquered, making use first of Italy, then of Greece and the East, and eventually of Spain and France, she gave an equivalent wherever she carried her eagles and spread all around her genius and her arts.

Edifices of every kind were reared on the banks of the Tiber, the prevailing ideas of which were borrowed from other nations; while foreign countries on the other hand were embellished with the products of the Roman genius.

Italy was covered with aqueducts and the highways were lined and ornamented with tombs; towers and temples covered the land.

Following the example thus set by Rome, almost every city of the ancient world came in time to have its arena, its triumphal arch, its columns and its baths. Rome multiplied herself, yet remained ever unique. From the second century

everything became Roman in its characteristics, and ages have not sufficed to suppress the habit which became a second nature.

DRUIDICAL REMAINS IN BLAIR ATHOLL.

ACCORDING to the best authorities on Druidism in Scotland, says a correspondent of the *Dundee Advertiser*, an ancient religion had its seat and headquarters in Perthshire, somewhere near the Grampian range. Blair Atholl, although not the Druids' "Eternal City," yet in its day must have been one of the strongholds of their faith, if we may judge from the number of mounds, standing stones and circles which still remain in the district. That these relics should have come down to us from the dim past is probably due to the fact that Highlanders always viewed them with awe, the common belief being that "misfortune will closely follow the mortal who removes a Druid's stone."

The tourist or antiquary visiting Blair Atholl may in an hour's easy walk reach the mound on the eastern shoulder of Lude Hill. Owing to the mound's immense size and its commanding position, it forms a conspicuous object in the landscape, and may easily be viewed from the carriages of the Highland Railway as the train nears Blair Atholl. This colossal pile is circular in form, as the architectural efforts of primitive races invariably were. The base circumference measures 381 feet, while the sloped sides rise to 20 feet in the centre, thus forming a flattened cone. The foundation had originally been formed of great boulders arranged in a circle, and the inside built up with smaller stones in the form of a cairn, while the interstices were filled in with earth. On the summit of the mound the two side stones of a cromlech or Druids' altar project a little above the surface, and are 3 feet 10 inches apart. In the "Statistical Account" of the parish, published about the end of last century, the writer mentions that there was also a stone pillar, but unfortunately the pillar and a number of the foundation-stones have been removed. Chambers, in his learned work "Caledonia," says that "the Druids not only officiated in the affairs of religion, but also administered justice, their temples serving as law courts."

When the temple consisted of a mound, as in the present case, the priest, as judge, occupied the most elevated position, the pleaders, witnesses and criminals standing a little lower on the sides, while the general public stood at a respectable distance from the scene. The mound under consideration is mentioned in history as early 729 A.D., when Angus M'Fergus, the King of the Picts, after defeating the Maormor, or King of Atholl, met the vanquished king at Dunsith and signed the terms of peace; hence the name (pronounced) Dunsheë, or "Mound of Peace." In the locality the mound is known as the Shean, or the Fairies' Knoll. The good spirits were supposed to dwell in the doune or mound, and as silent witnesses watched the various transactions which took place within their domain.

That these mounds were used as law courts cannot be doubted, as the custom may still be traced in the place names in various parts of the country. Tynland Hill, in the Isle of Man, is still resorted to once a year, when with great rejoicing the laws are promulgated, no doubt a survival of what took place all through the country in the far past. Chambers, the authority already quoted, says the Druids were divided into three orders—the Druids, the Vates and the Bards. The Druids were the theologians, the Vates the professors of natural science, while the Bards sang in heroic verse the noble deeds of the brave and the true. These various orders performed their respective duties within the precincts of the sacred enclosure.

Interesting as the Druidical mounds are, they must yield the palm to the deeper interest centred in the cromlechs and circles. Cromlech is supposed by some authorities to mean "the bowing stones," or the stones obeisance was made to; but the majority regard it as signifying "the bent stone." The altar was formed of two standing stones, with one across the top, and from this top stone, which was always concave, the name "cromlech" is supposed to have been derived. There is not, unfortunately, a complete specimen of a cromlech in Blair Atholl, although the two side stones are to be found in various parts of the district. Besides the altar on the top of the "Shean," there is one on the shores of Loch Morag, and another near Loch Tummel. There was also a large altar at Bruar, quite close to the public road. There is only one of the stones now standing, the other having disappeared years ago. The remaining stone measures 5 feet 8 inches high, 4 feet broad and 20 inches thick. These side stones were commonly from 3 to 4 feet apart, and are known all over the Highlands as Clach-n'-iobairt, or the "Stones of Sacrifice." Baked cakes were offered at times on these altars, and it is of interest to note that in Wales, where some of the ceremonies of the Druids still survive, the archdruid stands within a circle of twelve stones, the stones being decked with the first offerings of the harvest.

But although the cake offering might on some occasions

satisfy the conscience of these sin-burdened men, yet, in common with other religions, Druidism demanded sacrifice by the shed blood of beasts. Some have even ventured to suggest that human sacrifices were at times offered. It is difficult now to ascertain whether that was the case or not, but certain it is that blood was shed, and possibly it may have been occasionally human. Nevertheless, the Druids were not the gross idolaters which they are sometimes represented. God was spoken of as the "Great Unseen," or Be'il—a name which some have imagined to be synonymous with Bel of the Babylonians. But this is a mistake, it being a contraction of Bea'il (the source of all existence).

The Druids' creed, consisting of four articles, attests its simplicity—(1) To worship God; (2) to abstain from evil; (3) to exert courage; (4) to believe in the immortality of the soul.

The cromlechs, being required to satisfy the spiritual wants of the early emigrants, would in all likelihood be erected first, and may have been placed in their present positions 3,000 or 4,000 years ago. The temples, being simple in form, would immediately follow. They commonly consisted of from four to twelve stones standing in an upright position, and arranged in a circle of from 20 feet to 30 feet in diameter. This circle was surrounded again by a larger circle. The Druids' temple was always roofless, "open to the face of the sun," the sun being the shadow of the Great Unseen and also the medium by which they worshipped God. Possibly the sun itself may have been worshipped, the transition from shadow to reality being quite natural and simple. The great temple of Grenich favours this view, as the name Grenich means "field of the sun," and it is quite within reasonable bounds to believe with Robertson, in his "Gaelic Topography of Scotland," that this was a place of worship dedicated to the sun. This temple is situated on the raised land overlooking the head of Loch Tummel. The outer circle measures 82 feet in diameter and can be distinctly traced, but the large stones of the inner circle have, like the Bruar cromlech, been "spirited away," although their position is still apparent from the holes left in the ground.

But of all the ancient Druidic remains in Blair Atholl, "Na Carrigeon" must be considered the most interesting, not only from its completeness, but also from its surroundings. This hoary temple occupies the summit of Edintean Hill, and overlooks the dark waters of "Lochan-na-Leathain," a loch to which several strange legends are attached. A little to the south-west are two caves running into the hill, while 30 feet or 40 feet below the "Na Carrigeon," a stream of water issues from a small round hole in the rock. The whole place seems charged with mystery, and no doubt for this very reason the Druids chose it as one of their "high places." This temple is composed of four upright stones, forming a circle of 21 feet in diameter, surrounded by another circle of 51 feet in diameter. These stones stand from 3 feet to 4 feet 6 inches high, and are placed to correspond as near as possible with the cardinal points of the compass, proving that the Druids possessed a fair knowledge of the motions of the heavenly bodies. The shadows cast by those stones played an important part in their religious ceremonies, as they both symbolised divine truth and denoted the time. As can easily be seen, the four stones cast only three shadows at three specific times, viz. at 6 A.M., 12 noon and 6 P.M., corresponding to the morning, noon and night of the easterns; while again at 8 A.M. and 3 P.M. the stones cast but two shadows—rather a striking coincidence, as these were the hours of the "morning and evening sacrifice" of the Mosaic economy. The space enclosing the stones is depressed to the depth of about a foot in the centre, in which a little water oozes up—a remarkable phenomenon on the top of a hill. Here, again, we have a suggestion of the stream which issued out of the temple on Mount Moriah, and which several of the writers of Scripture make allusion to. The name of "Na Carrigeon" seems rather difficult to translate. The word comes from carrig, a rock, carrigeon being the plural form; yet Gaelic scholars hesitate to say it means "rocks." Doubtless the word has some deeper meaning, referring to some of the ceremonies which were practised within the circle.

PROFESSIONAL PRACTICE IN AMERICA.

THE Chicago Architects' Business Association have adopted the following rules of practice:—

Drawings.—All drawings forming a basis for contracts shall be drawn to a scale of not less than one-eighth of an inch to the foot, in ink or by some other process that will not obliterate. General dimensions shall be accurately figured and the drawings made explicit and complete.

Scale Drawings.—All portions of the work that require a larger scale to illustrate the same shall be drawn full size or to a scale large enough to make them fully set forth what is required by the architect. No architect shall ask for bids on any work until all general drawings are complete and sufficient details made, which, in connection with the specifications, will settle all questions affecting the cost of work.

Supervision of Work.—The supervision of an architect shall be such as shall require the faithful execution of the work according to the true meaning and intent of the plans and specifications, but such supervision does not cover the duties of a clerk of the works. In case there is no clerk of the works provided by the owner, contractors must refer any questions about which there can be any doubt to the architect for decision before proceeding to execute the work.

Specifications.—Specifications must be prepared in ink or by some permanent process, and shall clearly explain the kind and quality of materials and methods of construction, and give such further information as may be needed to definitely supplement the drawings.

Everything that will be required in the work must be mentioned in the specifications as far as practicable, being classified and grouped under appropriate headings, and work called for by the plans and not referred to in the specifications, and *vice versa*, shall be included same as if mentioned by both plans and specifications, provided such work comes clearly within the branch or branches covered by the contract.

Rules for Letting Contracts.—Written invitations for proposals will be forwarded contractors for work to be let, stating when bids will be opened. This does not apply to public work requiring advertisement for proposals. Contractors desiring place upon the roster of an architect's office shall furnish reference as to mechanical ability and fidelity and be prepared to furnish a good and sufficient bond. Proposals shall be presented on the day set for opening same and will be opened in the presence of a representative of the bidders. Proposals shall be opened, read and posted at the time specified before such bidders as are present. Contracts shall be awarded by owners or architects within a reasonable time thereafter. Bidders shall not be held on proposals retained longer than ten days after date of opening. The lowest bidder will not be permitted to change the amount of his bid, but must sign contract or withdraw. The right is reserved to reject any or all proposals. If, after the opening of bids, changes are made in the plans and specifications amounting to not more than 10 per cent., the lowest invited bidder shall tender a detailed proposition for said changes, subject to the approval of the architect and owner, and if found fairly detailed the contract shall be awarded to him upon his bid so changed. Lack of ability to carry out the work in a proper manner, want of fidelity, or disposition to render less than is due, the owner, in strict conformity with the terms of contract, shall lay the contractor liable to be dropped from the roster of the architect temporarily or permanently, as in the judgment of the architect is just and right and in the interests of his clients. Final certificates of payment on a contract shall not be issued by the architect until the contractor has returned all plans and specifications to the office of the architect.

TESSERÆ.

Roman Monuments.

THE circular form was a favourite one with the Romans for their sepulchral structures of a more pretending class than ordinary. It will be sufficient here merely to mention those in honour of Augustus and Hadrian. The Tomb of Cæcilia Metella is a low cylinder, the height being only 62 feet while the diameter is 90, and it may be considered as nearly solid, the chamber or cella being no more than 19 feet in diameter. This cylindrical mass is raised upon a square substructure, which combination of the two forms is productive of agreeable contrast, and it was accordingly frequently resorted to. The Tomb of Plautius Sylvanus near Tivoli consists also of a short cylindrical substructure on a square basement, but is otherwise of peculiar design, one side of that stereobate being carried up so as to form a sort of low screen or frontispiece, decorated with six half-columns and five upright tablets with inscriptions between them. The Tomb of Munatius Plancus, at Gaeta, is a simple circular structure, of low proportions, the height not exceeding the diameter and therefore hardly to be called a tower, notwithstanding that it is now popularly called Roland's or Orlando's Tower. Of quite different character and design from any of the preceding ones is the ancient Roman sepulchral monument at St. Remi, which consists of three stages—the first a square stereobate raised on gradini and entirely covered on each side with sculptures in relief; the next is also square, with an attached fluted Corinthian angle and an open arch on each side, and the uppermost is a Corinthian rotunda, forming an open or monopteral temple (*i.e.* without any cella), the centre of which is occupied by two statues. As instances of other combinations we may briefly refer to what is called the Tomb of Virgil, near Naples, consisting of a square substructure surmounted by a conical one; to the Roman monument at Constantina, in Africa, conjectured to have been a cenotaph in honour of Constantine, the lower portion of which is a cylindrical structure surrounded by a peristyle of twenty-

four Doric columns and carried up as a lofty cone in receding courses or gradini, leaving at its summit a platform for an equestrian statue.

Slopes of Roofs.

The degree of slope given to the inclined faces of a roof varies according to the covering material employed, as well as to the climate. The ancient Grecian temples had very low or pediment roofs, varying from about 12 degs. to about 16 degs., the height being from one-ninth to one seventh of the span. In Roman buildings the inclination is somewhat greater, being usually 23 degs. or 24 degs., or from one-fifth to two-ninths of the span. The general introduction of the Pointed style of architecture led to the use of very high-pitched roofs, a very common proportion being that in which the length of the rafters is the same as the span, so that they formed an equilateral triangle. In comparatively modern Domestic architecture in this country it has been considered desirable for the length of the rafters to be three-fourths that of the span, and an angle of 45 degs. is still considered by some to be the best pitch when plain tiles are used. As builders can in the present day obtain excellent covering materials, the pitch may be made of any required degree, down to the low Grecian pediment, and it therefore depends on the style of architecture and the taste of the builder; the most common height being from one-fourth to one-third of the span. High roofs discharge rain the most rapidly and do not retain snow so much as those of low pitch, but where they have gutters they are liable to become choked by snow sliding into them and to overflow from water running into them faster than the pipes can convey it away. Steep roofs may be covered with small slates and are less likely to be stripped by violent winds. Low roofs, in consequence of their superior lightness, are less expensive, the timbers not only being shorter, but of proportionately smaller scantling, and they press less injuriously on the walls.

Breadth in Painting.

Breadth, or that quality of execution which makes a whole so predominate over the parts as to excite the idea of uninterrupted unity amid the greatest variety modern art owes to Michel Angelo. The breadth of Michel Angelo resembles the tide and ebb of a mighty sea; waves approach, arrive, retreat, but in their rise and fall, emerging or absorbing, impress us only with the image of the power that raises, that directs them, whilst the discrepance of obtruding parts in the works of the infant Florentine, Venetian and German schools distracts our eye like the numberless breakers of a shallow river, or as the brambles and creepers that entangle the paths of a wood, and instead of showing us our road perplex us only with themselves. By breadth the artist puts us into immediate possession of the whole, and from that gently leads us to the examination of the parts according to their relative importance; hence it follows that in a representation of organised surfaces breadth is the judicious display of fulness, not a substitute of vacuity. Breadth might be easily obtained if emptiness could give it. Yet even in that degraded state, if gratification of the eye be a first indispensable duty of an art that can impress us only by that organ, it is preferable to the laboured display of parts ambitiously thronging for admittance at the expense of the whole; to that perplexed diligence which wearies us with impediment before we can penetrate a meaning or arrive at the subject, whose clear idea must be first obtained before we can judge of the propriety or impropriety of parts. The principle which constitutes the breadth of Raphael was neither so absolute nor so comprehensive as that of Michel Angelo's. But his perspicacity soon discovered that great, uninterrupted masses of light and shade bespeak, satisfy, conduct and give repose to the eye; that opposition of light and shade gives perspicuity. Convinced of this, he let their mass fall as broad on his figures as their importance, attitude and relation to each other permitted, and as seldom as possible interrupted it. Masses of shade he opposed to light, and lucid ones to shade. The strict observation of this rule appears to be the cause why every figure of Raphael, however small, even at a considerable distance, describes itself and strikes the eye with distinctness, so that even the comparatively diminutive figures of his Loggie are easily discriminated from the Cortile below. To this maxim he remained faithful in all his works, a few instances excepted, when instead of light and shade he separated figures by reflexes of a different colour, exceptions more dictated by necessity than choice, and which serve rather to confirm than to impair the rule.

Portraiture with the Romans.

It was a custom among the ancients in very early times for warriors to have their portraits painted upon their shields, called by the Romans *imagines clipeorum* or *imagines clipeata*, and these shields were frequently dedicated in the temples in honour of their owners when deceased, or placed by victors as trophies (*clipei votivi*). The portraits were most probably painted in wax, but that they were well executed is very

doubtful. Among the Romans in the time of the republic the possession of the portraits of their ancestors (*imagines majorum*) was a proof of nobility; for by the *jus imaginum* none were permitted to make portraits of themselves except those who had themselves, or whose ancestors had, borne some curule magistracy; and Roman families were accustomed to boast of their *fumosa imagines* as a proof of their ancient nobility. These portraits or images, which were of wax, were preserved with great care by their posterity, and were only brought out upon great occasions or carried before them in funeral processions. They were probably painted busts, for the art of casting with wax in plaster moulds taken from the life was, according to Pliny, invented as early as the time of Alexander by Lysistratus, the brother of Lysippus. It seems that the Romans were also sometimes in the habit of prefixing the portraits of authors to their works. Martial mentions one of Virgil.

The Style of Titian.

The style of Titian's design has two periods: he began with copying what was before him without choice, and for some time continued in the meagre, anxious and accidental manner of Giovanni Bellini; but discovering in the works of Giorgione that breadth of form produced breadth of colour, he endeavoured and succeeded to see nature by comparison, and in a more ample light. That he possessed the theory of the human body needs not to be proved from the doubtful designs which he is said to have made for the anatomical work of Vesalio; that he had familiarised himself with the style of Michel Angelo, and burned with ambition to emulate it, is less evident from adopting some of his attitudes in the pictures of Pietro Martire and the Battle of Ghiaradadda, than from the elemental conceptions, the colossal style and daring foreshortenings which astonish in the Cain and Abel, the Abraham and Isaac, the Goliath and David on the ceiling of the fabric of Santo Spirito at Venice. Here, and here alone, is the result of that union of tone and style which, in Tintoretto's opinion, was required to make a perfect painter—for in general the male forms of Titian are those of sanguine health, often too fleshy for character, less elastic than muscular, or vigorous without grandeur. His females are the fair dimpled Venetian race, soft, without delicacy, too full for elegance, for action too plump; his infants are poised between both, and are preferable to either. In portrait he has united character and resemblance with dignity and still remains unrivalled.

GENERAL.

Mr. F. J. Warden-Stevens has prepared estimates of capital outlay &c., for an alternative area of supply for the electric-lighting scheme of the borough of Lewes, in accordance with further instructions received from the Corporation.

Dr. Fortnum has presented two cases of rings and engraved gems and medallions to the Ashmolean Museum, Oxford.

M. Tocilescu, while making researches in the Dobrugea at Adam Klissi, has discovered a basilica of the time of the Emperor Trajan, constructed of marble and consisting of thirty-two columns.

Mr. A. J. Spilsbury, of Queen's College, Oxford, has been awarded the studentship at the British School, Athens.

Mr. A. J. Balfour will open on December 3 the University Hall erected in Edinburgh at the cost of Mr. M'Ewan, and from the plans of Dr. Rowand Anderson.

The Borough Polytechnic is to be enlarged by the addition of five workshops and a gymnasium. The sum of 2,500*l.*, which was gained by letting seats for the Jubilee procession, will be applied towards expenses.

The London Water Commission will hold the first meeting for the reception of evidence in the "Moses" committee-room of the House of Lords on Monday next. The representatives of the London County Council will be the first witnesses.

The London County Council on Tuesday agreed to expend about 147,000*l.* on temporary buildings for pauper lunatics on the Horton Manor Estate, Epsom, which is to be the site of a permanent asylum.

Messrs. Frost & Reed are now exhibiting in Bristol twenty-two water-colour drawings by Mr. Tom Lloyd, R.W.G., which were specially painted by the firm.

The Representatives of the Corporation of London (Sir G. Faudel Phillips, Sir E. J. Poynter, P.R.A., and Mr. Temple) having visited the collection of about 200 old English, Italian and Dutch pictures which were offered to form a nucleus for an art gallery at the Guildhall, announce that, taking into consideration the varied quality of the works, though gratefully recognising the well-intentioned offer, they could not advise the Corporation to accept the whole or any portion of it.

The Architect.

THE WEEK.

THAT Admiralty engineers can occasionally be negligent was manifested by the action for injury to Rochester Bridge which was decided by the Lord Chief Justice on Monday last. The wardens of the bridge claimed 12,000/. There was no doubt that damage was done to the structure by a barge belonging to the defendants, but they pleaded that there was contributory negligence on the part of the plaintiffs, the bridge having been built after an improper design and of defective materials. They contended also that the bridge was erected in contravention of the Act of Parliament in not having sufficient headway, and that it was in fact an obstruction. The Act stated that the waterway was to be so constructed as to leave a clear headway of 18 feet, and the defendants' counsel were justified in insisting that what was intended was to have at least that height throughout the opening. It is a common phrase which is accepted as having only one signification. When the Britannia Bridge was proposed to cross the Menai Strait the Admiralty laid down the condition that there must be a headway of 103 feet. RENDEL, who was the engineering adviser to the Admiralty, after investigating the circumstances, proposed that the 103 feet should apply to the part over the navigable channel. His intention was to enable STEPHENSON to construct a very flat elliptic cast-iron arch. But the Admiralty would not depart from the condition, and in consequence it was necessary to devise the system of tubular girders which was an innovation in bridge building. When the plans for Rochester Bridge were submitted, the Admiralty departed from the official precedents and the common acceptance of words by sanctioning a bridge which was only 18 feet clear at one point. The Lord Chief Justice acknowledged that he was in doubt, but he came to the conclusion that the proper construction of the words of the Act was that the clear headway of 18 feet meant under the centre of the arch. His lordship's decision on any legal matter is entitled to the utmost respect. But in the case of bridges it will be found that in practice an altogether different interpretation of words is adopted. Just as waterway means the whole space available for the flow-water, headway means the space available for the passage of an object. The word headway is comparatively recent (it is not found in JOHNSON), and it was first applied to the progress of ships against adverse winds. In its application to construction the idea of opposition was retained. A headway of 18 feet means that an object of such a height can pass through without obstacle; but there is nothing to suggest that the object must resemble a mathematical line of length without breadth, and pass beneath the central point. The apparatus to be seen in the yards of goods stations, which tests, by means of bells attached to it, whether railway waggon when loaded correspond with bridge openings, gives a good notion of the signification of a headway. It is not a mere point which has to be determined, but as many points as are to be found in the width of a waggon. If, as Lord RUSSELL holds, the centre of the arch were alone considered, "rise" or "versed sine" would have been used instead of "headway." From the importance of the subject, we hope an appeal will be taken. It is unfortunate that the Admiralty officers were napping, but it will be well for us if they do not succumb to drowsiness in graver matters than the examination of the section of a bridge.

THE fourth general exhibition of fine arts and art industries at Barcelona will be opened on April 23 next. The municipality have funds for the purchase of exhibited works, and contributions will be added towards the same object by the Queen of SPAIN, the Infanta ISABELLA, the Government, the Corporations and prominent citizens of Barcelona. The Commission charged with the direction of the selection will consist of competent members. Committees will also be formed of representatives of foreign countries living in Barcelona. The Mayor of Barcelona

will invite artists on behalf of the municipality and through the respective committees to send some of their works to the exhibition, and all costs of transport, going and returning, will be borne by the city. The works acquired by the municipality will be utilised for the fine arts and art industries museums, which already contain examples of the principal Spanish and foreign artists, such as MM. DETAILLE, BARABINO, VAN BEERS, LENBACH, ROLL, SIGNORINI, MESDAG, ROUBAUD, ROCHEGROSSE, OCA-BIANCA, BARTELO, BIRKINGER, DELAHAYE, CORELLI, KARBOWSKY, ENGEL, MORBELLI, HUMMEL, TITO, BEAURY-SOUREL, ZANDOMENEGHI, RENOUART, HYNALIS, CASSIAZO, BOUCHER, APOLLONI, CHARLIER, BARRAU, SARTI, DUPONT, BUSCH, FREMIET, PANDIANI, HEIDEN, &c.

DURING several months there has been some excitement in the important district of which Finsbury Circus, Finsbury Pavement and London Wall are part, concerning the proposed project of the Bridge House Estates committee of the Corporation for an improvement. It appears that the leases of about eighty premises, with a rental of 3,486/., will expire at Midsummer 1899. The committee recommended that a road 30 feet wide should be carried through from Albion Place to West Street, that the premises in Finsbury Pavement and the buildings at the rear should be pulled down, and the site let on building lease for eighty years by public auction; that the remainder of the area should be divided into four blocks and dealt with in a similar manner at such times subsequent to the letting of the first block as might seem to the committee advisable and with a minimum of inconvenience to the present occupiers. It was calculated that by the arrangement the rental would be over 20,000/ per annum. The Corporation is an excellent landlord, and some of the leaseholders suggested that they should have a claim on the new sites. The committee, as a compromise, proposed that the remainder of the area, before or after dealing with the first block, should be offered in a greater number of blocks than four. There was a long discussion, but eventually an amendment was rejected by a majority of ninety-one votes, and the committee's recommendations were adopted. The Corporation has therefore undertaken its most important building scheme of the century, and on the success will no doubt depend some other building schemes. The district to be altered may be considered as wealthy, but in character it is hardly worthy of its position. Although the plans for the improvement have been prepared in the offices of the Guildhall, it is to be hoped that there will be some liberty allowed to those who are fortunate enough to obtain building sites.

It is the good fortune of the French to have a world-wide reputation for the production of a class of works of art for which no better name appears to be found than "objets d'art." They are mostly examples of the sculptor's art on a small scale. The demand for such works has been so extensive that a vast number of inferior imitations are to be found in the market. As there is a danger that foreigners and others may confound the two classes, a Society has been formed for upholding the true artist's work and setting aside what is of lower quality. The president of the new Society is M. GÉRÔME. The committee will consist of a dozen members. It is proposed to stamp with the mark of the Society all works submitted which are considered to be worthy to uphold the reputation of French artists. Exhibitions will be held from time to time in Paris and elsewhere to make the public acquainted with the works which have been approved. The proposal is not entirely original. The Chinese and Greeks have had a special stamp, and a guild mark was commonly found on the best examples of Mediæval craftsmanship. The practice was suppressed during the first French Revolution. The new Society will not only serve to separate the good from the bad, but it will also be a guarantee that the works bearing the stamp are genuine French examples and not foreign forgeries.

FRIDAY'S FIRE.

THE fire which destroyed a section of the City a week ago was on a scale that happily went beyond the experience of experts, and it was enough to astonish all London. But there is satisfaction in knowing that as yet nobody has come forward to charge architects and builders as the original cause of the disaster. The buildings which have succumbed were not perhaps examples of the most secure forms of construction. All the conditions prescribed by the Legislature and the municipality were, however, observed in them, and what more can be expected? There has been a great loss of property, and whether the expense of restoration falls on insurance companies or on individuals, the result is the same. It is only a purblind policy that can see any cause for gratification in such a vanishing of the products of labour, for so vast a loss cannot be balanced without the withdrawal of labour and capital from other undertakings. Equilibrium in business is not to be re-established without paying a costly price, and part of it has to be furnished by people who appear to be without any concern in the operations.

The most remote of our colonial subscribers will know long before reading these lines the circumstances of the fire, and the position of the district between Aldersgate Street and Wood Street so suddenly attacked. In Jewin Street and the neighbouring streets the flames were most destructive. In them were congregated a host of distributors and a few manufacturers. London businesses are following old precedents, for their representatives are congregating in special quarters. Wood Street, for instance, although far from being as imposing as it should be, is now as well known to traders throughout the world as Cheapside or Cornhill. In the houses which are now in ruins were to be found the satellites of the warehousemen and manufacturers of Wood Street and a few similar streets. A thousand things which men who bought and sold on a big scale would consider as not worth attention were to be obtained instantaneously from little depôts consisting of a room or two in Wells Street, Hamsell Street, Jewin Crescent, Bradford Avenue, &c. As it is difficult to obtain premises in the older thoroughfares, which are supposed to be paved with gold, some manufacturers and importers on a large scale were compelled to find a footing in those minor streets; but the majority of the occupants of the premises, and especially of the parts above the ground floors, were considered to be among the humbler classes of the mercantile community. Commission agents, dealers in fancy goods, trimmings, gloves, straw hats, feathers, umbrellas, shirt makers, artificial flower makers abounded in the region. Many were foreigners, who had at their disposal portable goods from all parts of the world which could be employed in clothing.

It is well to remember the character of the occupants in order to understand the extraordinary rapidity of the destruction of the buildings. They did not resemble buildings which are occupied as dwellings, chambers or ordinary offices. They formed a combination of warehouses and business premises on a small scale more tightly packed than elsewhere. It is doubtful whether any provision was made for such an occupancy. To have several metal safes on a floor may not be a source of danger, but the fall of a safe from a height is sure to bring ruin to a building that is on fire. The goods that were collected in the rooms were not of a class to impose weight on walls or floors, but as they were generally inflammable they were injurious in another way. Gas was in request during the foggy weather, and there can be no doubt it was one of the agencies in extending the conflagration. According to Colonel ROTTON, the chairman of the Fire Brigade committee of the County Council, the extraordinary rapidity of the fire was entirely due to the nature of the buildings, the stock they contained, the distribution of enclosed courts and well-holes, numerous communications in party walls, and the narrowness and relative positions of the thoroughfares.

With conditions so adverse the wonder is that the fire was not able to seize on a larger number of buildings. If the force of flames could be measured it would probably be found that never was so destructive an amount of power let loose in London. The strength and resolution of the Fire Brigade and the strategy of Commander WELLS

fortunately were able to conquer the foe, and we hope it will be long before they have to sustain a similar test of their combativeness. The excellent discipline of the City Police was also invaluable. As it was, the crowds of spectators impeded the advance of the fire-engines, and it is plain that henceforth in considering the risks of fire it will be necessary to include a London crowd as a serious obstacle against which unpleasant measures must be employed.

The fire has not demonstrated any serious defect in the organisation for coping with such dangers in the Metropolis. By the promptitude of the police not a moment was lost, the Fire Brigade was quickly at work, and there was no delay or breakdown of the water-supply. That in such a hive of industry not one life was sacrificed seems like a miracle. Taken as a whole, we cannot expect to have a more successful contest with a big fire in the narrow streets of London.

There is one consideration which should not be neglected. The buildings destroyed will probably be succeeded by others of a similar construction. The Jewin Street district had acquired characteristics which are not likely to be neglected by the property owners. Projects for the creation of grandiose Wood Streets cannot find much favour at present. The agents, ostrich feather merchants, the manufacturers and straw hat importers are likely to return to the streets which were familiar to them. But some preparation should be made for their reception. If many business premises on a small scale must be congregated under one roof, it is only prudent that the construction should not be of the simplest character allowed by the Building Act. If a man crowds his room with inflammable things such as straw goods, sticks and toys, surely there should be more precautions adopted for the protection of his neighbours than are necessary when the tenant is a solicitor or financial agent. The offices in the consumed houses did not correspond in purpose with those occupied by architects in Bloomsbury, by engineers in Westminster, and by lawyers in the Temple or Lincoln's Inn, but in a constructive sense there was not much difference. It is time the dangers should be recognised and adequate precautions adopted. The fire of Friday last was kept with difficulty within narrow limits. Under more unfavourable conditions of the atmosphere the loss would undoubtedly have been increased. In considering the fire problem, it is well not to be too sanguine, and if there are to be streets with stage upon stage of store-houses of fancy goods, we ought to take care the stages cannot easily be combined into a ruinous force which will be withstood with difficulty. That can only be done by a more costly construction of all the floors and by a different arrangement of the staircases.

GEOLOGY IN NEW SOUTH WALES.

AT the present time the British colonies are receiving much more attention in England than usual, and it is to be hoped mutual advantages will follow. Among other effects of the improved relations will be the increase of knowledge respecting colonial productions. From that an extension of trade may follow. The use of Australian timber of late years in the streets of London should be taken as evidence of English goodwill and the desire to support colonial enterprise as far as possible.

There is no doubt about the efforts of the officials in the colonies to inform the world concerning their departments, and especially the Australasian officials. One proof is seen in the details which are supplied of the work of the Geological Survey Department of New South Wales during the past year.

It is only natural that colonial statesmen should endeavour to employ, as soon as practicable, those industrial resources which do not need to go through elaborate processes. Hence we find that in New South Wales the sum of 500*l.* is offered to whoever first discovers a new reefing or alluvial gold or tin field, or a new deposit of silver, copper, diamonds or precious opal. Moreover, if in a year after the discovery 500 miners are employed on the spot, another sum of 500*l.* will be paid to the discoverer. No less than twenty-one applications were made for the reward in the past year, but unluckily not one of them was supposed to comply with the conditions. The Government

assist in other ways, for every possible encouragement is given to miners in cases where there is a likelihood of eventual success.

The Government geologist, Mr. E. F. PITTMANN, has not only to look after his staff, but he has to engage in a variety of operations. One time he has to investigate the heating of coal on board ships, then he is called to report on a proposal to establish a Government quartz crushing battery. Next we hear of him inspecting an "auriferous diamantiferous deposit." Money was granted towards the expense of sinking a shaft, but water rushed in and put a stop to operations. The Surveyor believes that the occurrence of diamonds in the quartz pebble drift points to the possibility of their being derived from the volcanic breccia, as in the diamond mines of Kimberley, South Africa. Evidently there is confidence that below the surface of New South Wales there are treasures to make the inhabitants wealthy without other aid. Water has a right to be included among the treasures, and colonists will read with satisfaction of certain mud-springs inspected by the Surveyor, which are accepted as "evidence of the extension of the lower cretaceous artesian water-bearing beds a considerable distance further south than they were previously known to occur." A proposal to construct a deep-water harbour at Port Kembla also engages his attention. The time of some of the geologists appears to be almost entirely occupied with reports on goldfields. In the Assay Office no less than 6,013 assays and analyses were made last year, a result of the increased activity in mining matters.

According to the official returns the aggregate value of the mineral products of New South Wales to the end of 1896 amounted to 118,367,234*l*. Last year was not remarkably productive, but the minerals obtained were valued at 4,478,368*l*. The scarcity of water, owing to drought in several of the goldfields, was the main cause of a decrease of 242,569*l*. in gold alone, as compared with the returns of 1895. The average earnings of the miners are calculated at 51*l*. 13*s*. 3*d*., or about 1*l*. weekly, but many of them follow other occupations. According to the report the figures "are sufficient to show that, with ordinary energy, a man settling on one of our goldfields can at least make a living, with the ever present prospects of striking something richer than usual." The value of the year's output of coal was 1,125,280*l*. The exports of silver and silver-lead amounted to 1,785,451*l*. The greater part came from the Broken Hill mines, of which the total mineral products were valued at 3,010,546*l*. The tin exported was valued at 102,117*l*. A gratifying revival has taken place in copper mining, the value of the exports being 200,311*l*. It is expected that the co-operation of English capitalists will lead to the setting up of works for the manufacture of the crude ores which are found in many districts of New South Wales, but the finished iron made last year only amounted to 4,721 tons, of a value of 33,283*l*.

In the search for gold and diamonds more common products are likely to be neglected. Marble deposits are known to exist in several districts of New South Wales, which have not received the attention their importance deserves. Fine samples of red brown to almost black can be obtained near Bathurst, and a beautiful grey tint near Mudgee. A nicely marked brown is obtainable in the neighbourhood of Molong, and a pure white from Caloola, near Newbridge, said to be equal to the second-class marble from the famous Carrara quarries. A deposit near Rylstone is of a black colour with white streaks and gold markings. Immense deposits of green serpentine also exist in the vicinity of Lucknow.

One important experiment is noticed. The Mining Department allowed the use of one of the diamond drills to the Royal Society on the occasion when an effort was made to gain authentic information in connection with the coral beds. The British Government allotted the *Penguin* to ship the whole diamond drill plant, the men engaged to work it, and members of the expedition from Sydney to Funafuti, one of the Ellice group of islands. The first bore was put down to the depth of 105 feet, of which 12 feet was coral. The remainder had to be driven through sand and loose pieces of coral, making it very difficult for tubing to be driven down. But the time allowed to do the work was too short. Before the arrival of a consignment of material and appliances to overcome the

drift-sand difficulty, the drill, plant and members of the expedition were on their return trip. Although not fully successful, the expedition gathered information which will certainly be a guide for further operations. The knowledge gained by a further expedition and more extended boring operations through the coral beds would be of great interest.

New South Wales will be able to rival Kentucky in its caves. They are under the control of the Government, and last year attracted 5,569 visitors. In some the electric light has been introduced, but magnesium ribbon appears to be mainly used during visits. Some of the caves take more than one day to examine. Judging by the number of visitors the Jenolan caves would appear to have most interest. The Wellington caves come next, and then follow Abercrombie caves, Yarrangobilly caves, Wombeyan caves, Bringoma caves and Bendithera caves. Mr. T. W. E. DAVID, one of the geological surveyors, has described some of the wonders of the Wombeyan caves. One is the Basin or New cave, of which he says:—

The entrance to this cave is situated on a steep slope above the bed of the Mare's Forest Creek. It is about 6 feet high by 12 feet wide; the cave slopes steeply downwards for about 20 feet into a chamber about 20 feet high, from the roof of which hang long ropy stalactites, nearly touching slender pillars of dripstone, rising to meet them from the floor. A second descent leads on to a small cupola in the marble, the roof ornamented as before by clusters of stalactites, and the floor with small rounded bosses of stalagmite. A further descent, past a mass of pendent calcite resembling a frozen waterfall, brings the visitor into a large chamber, the floor of which is traversed by ridges of stalagmite about 6 inches in height, ranged in wavy lines, like crumpled ribbons. From the remarkable evenness of their surfaces it is evident that they have once formed the margins of tiny ponds, now dry. Here the cave bifurcates. Following the left branch through a fissure 4 feet wide for about 40 yards, the visitor, after a slight descent, enters a dome-shaped chamber about 40 feet wide, and as many high. Following a gallery in the rock for about 100 yards past a stalactite known as the "Kangaroo's Tail," one of the most interesting objects in the caves is reached. This is a large pocket of stalagmite, which has grown by chemical action on the steeply sloping side of the passage, so as to form a perfectly water-tight tank, 5 feet deep by 3½ feet square. The wall of stalagmite, which constitutes three sides of this tank, is firmly cemented to the rock, has a perfectly level rim, and varies in thickness from a thin crust one-half inch in diameter at the rim to a strong wall of 6 inches or more through at its base. Passing on and still ascending, the principal feature of the cave comes into view—a staircase, in which the place of steps is taken by a number of stalagmitic pockets similar to the one just described, moulded out of the sloping rock. These vary in size from the smallest, about the size of a watch pocket, to the largest, measuring 10 feet long by 4 feet wide and 5 feet deep. Climbing to the top of the "basins," a second small series of stalagmite tanks is seen, plastered against the rock like swallows' nests. The height at which the water last stood in these cisterns is marked by a sparkling white film of calcite, studded with small tufts and rosettes of crystals of the same mineral.

The old cave, which measures about 90 yards in length by 40 yards in width, and with a roof from 50 to 60 feet high, is equally remarkable.

We also read of the "sounding-board," a transparent stalactite curtain 9 feet long, which resembles the woof of a coarsely woven material. When tapped it gives out musical notes. The "organ" is a huge stalactite, with fringes of stalactites that ring like a chime of bells. The "trophy" is a beautiful cluster of ropy and curtain stalactites about 15 feet high.

All the caves appear to have been formed by subterranean water-courses, and some are still being excavated. Although they were likely to be used as shelters, few fossil bones have been found in the Wombeyan caves, and there is consequently no clue to the age of the deposits. But if a foot stalagmite requires about forty years to form, it becomes evident that the ponderous "organ" and "trophy" are very ancient. Geologists will read the following suggestions about the uniformity between the past and present operations of nature which Mr. DAVID gives:—

The belt of limestone in which the caves occur is estimated by Mr. Young to be 2½ miles long by 1 mile wide. The rock is composed of a costly crystalline white marble veined with yellow. The coarsely crystalline varieties are less suitable for

lime-burning or building purposes than the more compact. Almost every kind, however, from the coarsely crystalline white marble to the blue limestone, can, I am informed, be obtained in the district. Mr. Young noticed fossils in one place only, namely, just below the New cave. These fossils show that the limestone bed is an old coral reef of palæozoic age. Buried beneath massive accumulations of clay, sand and quartz pebble conglomerates, and subjected for vast periods of time to intense heat and pressure, nearly all traces of the original organic structure of the corals and shells have been obliterated, and the old atoll has been converted into a bed of more or less crystalline limestone. The whole of these sedimentary strata with the underlying limestone bed have subsequently been slowly raised above the sea-level by those oscillations of the earth's crust which, as geology shows, have prevailed throughout all the past of which we have any record, and are even now in progress. Exposed to the denuding influences of air and water, the overlying rocks have been worn down until at last, at a point far inland, the fossil coral reef, now changed into limestone, is again laid bare. Then commences the process of cave-making already described. The lime dissolved out by the acidulated water in the course of the formation of caves is partly deposited in the beautiful and fantastic forms of stalactites and dripstones, but chiefly carried away in solution down the Wombeyan Creek into the Wollondilly River, on to the Nepean and Hawkesbury, and so out to sea at Broken Bay. Arrived in the waters of the Pacific, it is partly absorbed by fish, crustacea, shellfish and tiny organisms on our own coasts and partly carried southwards by the east Australian current, and later northwards into waters warm enough to support the life of the coral polyp, as at Lord Howe Island. Here it is taken up by the polyp and converted into beautiful coralline structures. Thus history repeats itself, and the coral polyps of to-day construct their stony skeletons out of the material which formed the bones of their Silurian ancestors. The Wombeyan caves are therefore interesting in many ways, as much from a scientific point of view as from the natural beauty of their scenery.

A colonial geologist has a busy time. He is expected to help miners by his advice, and it is well for him if he is not supposed to discover beds of gold. But when engaged on mining surveys he cannot forget the consideration of phenomena, and even amidst the arid districts of New South Wales there are opportunities to display the conservatism of nature, in adopting the same processes of destruction and creation which are to be witnessed in Europe.

ART IN THE COLONIES.

IN the address at the opening of the session of the Society of Arts, Major-Gen. Geo. Owen Tudor Burne, G.C.I.E., K.C.S.I., chairman of Council, referred to the progress of art in the colonies. He said:—I may remind you again, as I reminded you last year, that the term *Art* is defined by Lord Bacon as a proper disposal of the things of nature by human thought and experience, so as to answer the several purposes of mankind. Arts are therefore commonly divided into useful and mechanical, fine and liberal, the former being those wherein the hand and body are more concerned than the mind, and are known by the name of trades; and the latter being those which depend more on the labour of the mind, and are the produce of imagination. In the colonies we find a very creditable admixture of both these attributes, although it may be sufficient on the present occasion to refer more particularly to the fine and liberal arts, in which the colonies are making a progress which is eminently satisfactory.

Dealing with Canada first, it seems that there are several art schools in operation in connection with the many valuable educational establishments of that colony. Canada offers a fine field for the talent of nature's true artists, and although Canadian art has hitherto been imitative rather than creative, yet of late years, as the recent Chicago Exposition has proved, Canadian artists can produce pictures which show an individuality of expression which is most creditable to them, among whom more notable names are those of O'Brien, Reid, Bell-Smith, Harris, Forster, Brymner and Miss Bell. We are reminded also by a writer on this subject (Mr. Bourinot, C.M.G.) that the Marquis of Lorne and the Princess Louise, during their residence in Canada, did much to stimulate a wider taste for art by the establishment of a Canadian academy and the holding of annual exhibitions. We may feel sure, therefore, that in course of time Canada will give still greater attention to this branch of her progressive education than she does even now, and will soon follow the useful example of her Australian sisters in the establishment of national galleries and advanced schools of art.

In the seven great colonies of Australia we find much

progress made in the direction of art. Half a century ago no one troubled himself at the Antipodes about art, whereas now it is slowly gaining for itself a position which tends towards a distinctive Australian school. In New South Wales, for example—the mother colony of the Australias—an academy of arts was founded some twenty-five years ago at Sydney, in connection with other branches of public education, and an art gallery was subsequently opened and designated a "National Gallery," which is aided from Government funds, and is freely accessible to the public. The collection in this gallery represents a value amounting to about 90,000*l.*; while a colonial court, devoted to the work of Australian artists, is becoming a feature in the collection, and the purchase of a picture by the State is considered by these artists to be a high distinction. There are also in the country districts of New South Wales many schools of art allied with technical and other educational establishments. As to Victoria, we find that to her belongs the honour of being the first to initiate an art movement in the Antipodes, for after founding a public library at Melbourne in 1853, she added to it, a few years afterwards, a national gallery, in which the collection now amounts to about 450 oil-paintings, besides large numbers of water-colour drawings, engravings and statuary, and other works of art. Here, it may be added, a system of intercolonial exchange of pictures was inaugurated in 1894 for temporary exhibition purposes. There are also in Victoria eighteen provincial schools engaged in teaching science, art and trade subjects. In South Australia there is an art gallery, while drawing is made a compulsory subject in the State schools. In Queensland there are many institutions which comprise schools of art, and in connection with such a school established at Brisbane a technical college has been founded with much success.

In short, in our Australian colonies and in New Zealand there is a wide field for the genius of Antipodean artists who, although without such beautiful green fields and idyllic rural scenery as we possess in the United Kingdom, yet can appeal direct to nature of diverse character, "from the frigid heights of the Australian Alps to the waving palms and jungle-fringed rivers of tropical North Queensland." And we need only mention men like Lister, Streeton, Mahony, McCubbin, Fullwood, Spence, Roberts, Piquenett, Hanson and others, to come to the conclusion that there is a creditable amount of home talent in Australia which can appeal to limitless plains, silent forests, dark lily-covered lagoons, and the wild free life of the bush, for a thousand inspirations towards its development. There are many illustrations in England of the genius of these painters, and no doubt some of you have seen excellent specimens of Australian and New Zealand art in the Imperial Institute and in the Royal Colonial Institute and elsewhere—specimens which will bear good comparison with productions nearer home.

Passing on to the Cape, it may be mentioned that, although the fine arts do not occupy, at present, a large space in its rapidly improving educational establishments, yet that colony has recently passed an Act of Parliament for the purpose of establishing an art gallery at Cape Town, to contain, among other things, a collection of paintings and works of art hitherto held in trust by the South African Fine Arts Association. If I here confine these few remarks as to art to some of our larger self-governing colonies, it is merely, as I have before observed, for want of time. I have, perhaps, said enough to give you an impression that the subject is not neglected in our colonial empire, and I cannot better leave this portion of my address than by re-echoing the words of a true enthusiast (Frank Hutchinson), who tells us that the possibilities of art in Australia are, from a purely artistic point of view, limitless; for here are a thousand undiscovered charms and mysteries, sublime atmospheric effects, and infinite diversities of scenery and life as fresh as from the Creator's hand. With Australia, indeed, as with the minstrel of old, the way may be long and the wind may be cold, but she has at least within her the spirit of youth and daring, and ever ahead and beckoning her onward is—

Hope on the mountains
Beautiful as morn.

FIRE PROTECTION.

THERE could hardly be a more opportune time for the appearance of the first publication of the British fire-prevention committee than now arises. The pamphlet is entitled, "What is Fire Protection? A Study by Edwin O. Sachs, architect," and is obtained at the offices of the committee. The author goes over a wide field, and describes the organisations which at present exist for battling one of the enemies of building construction, and throughout he shows acquaintance with the subject. The following extract will sug-

gest the author's manner of treating the responsibilities of individuals who own property:—

It will have been noticed that all the expenses referred to are such as to my mind fall on the public purse, and that I have not taken into account the actual cost of the better construction or arrangements which the Building Act and fire-survey regulations would require. The property owners would have to cover this expense individually, but I shall not call it a special or extra outlay, as I consider that stability, with due attention to sanitation and fire protection, should be the essence of modern building construction. Surely inferior construction not only shortens the life of a building, but it is also in every way detrimental to the interests of a *bona-fide* investor. Safe construction enhances the value of a property, and the protective measures need not occasion much additional expense. Why not consider fire protection just as much a primary necessity for building as the block-signal system is for railway construction? Is there much difference in aiding a man's death by fire and his death in a railway accident? Why consider it more legitimate to spoil your neighbour's property by fire than to steal it? Bad construction means a risk to one's neighbour's life and property as well as to one's own. It may not only cause a direct loss, but also spoil the man's business for years, and throw those out of employment who are dependent upon him. Why permit injuries of this kind?

Now this is the first time I have in any way distinguished between the safety of life and the safety of property. The protection of property, to which I may have seemed to be specially referring, must in any case include measures for the protection of life, as no fire can originate without there being some personal danger. It is practically immaterial if this danger affects the inmates or the firemen. The protective measures will serve for both, and means for life-saving must be forthcoming as soon as possible after an outbreak has been signalled; as the helpers themselves may want them quite as much as those in or near the risks attacked. It should also be remembered that both a good staircase and a ladder are often quite as useful for the manœuvring of the firemen as for life-saving purposes, and that they are practically quite as essential for the saving of property as for saving life. I do not hold that any distinction need be made between the two risks when speaking of fire protection in general; but as the safety of a single human life must always be classed higher than that of the most valuable property, it may be well to give life-saving the first place when alluding to the two separately.

Up to the present it will have been noticed I have practically only referred to the prevention of fires originating from natural causes, negligence, or accident. Criminal fire-raising may seem not to have had sufficient attention. To my mind there is little or no criminal work where a perfect system of fire protection has been introduced. What with good construction and a fire survey, the quick arrival of the firemen and careful inquests, the risks of detection are far too great to encourage its growth.

Under "Fire Prevention" I first referred to the special requirements of the Building Act, the clauses of which can greatly influence the safety of life by requiring practical exits and sufficient staircase accommodation. I cannot here specially refer to the risks in theatres and assembly halls, which, to my mind, require separate legislation; I simply speak of factories, offices, business premises, hotels and tenement houses. In no case should any inmate of a building be more than 60 feet away from a staircase, and preferably there should be two staircases at his disposal in the event of one being blocked. Generally attention is only given to the construction of staircases, but it must be pointed out that their ventilation is equally important. Smoke is even a greater danger than fire, and may hamper the helpers terribly. The possibility of opening a window has saved many a life.

As far as the protection of property is concerned, the prevention of outbreaks can be influenced by the careful construction of flues, hearths, stoves, and in certain classes of buildings by the construction of floors and ceilings, the arrangement of skylights, shutters and lightning conductors. Then comes the prevention of the fire spreading, first, by the division of risks; secondly, by the materials used in construction.

When I speak of the division of risks the legislator's first ambition must be to prevent a fire in one house spreading to another, and a stranger's property, so to say, being endangered. This is quite possible, given good party walls carried well over the roof to a height regulated by the nature of the risk, the arrangement of shutters to windows where necessary, or the use of fire-resisting glass; again, a thoroughly good roof—or, still better, a fire-resisting attic floor—can do much. If the locality has a fire brigade, and the force is decently handled, "spreads" from one house to another should never occur. Narrow thoroughfares and courts are, however, a source of danger which may baffle all efforts to localise a fire. This should be remembered by those responsible for street improvements.

The division of a building or a large "risk" into a number of minor ones is only possible to a certain extent. I do not hold with spending enormous sums in order to make each of the minor "risks" impregnable. Our desire should be simply to try to retard the spread for a certain limited time after the flames have really taken hold of the contents. In those minutes most fires will have been discovered, and, where there is an efficient fire-extinguishing establishment, a sufficient number of firemen can be on the spot to localise the outbreak and prevent the conflagration being a big one.

Take a drawing-room in an ordinary well-built house. If the joists are strong and the boards grooved, if some light plugging be used and the plastering properly done, if the doors are made well-fitting and fairly strong, a very considerable amount of furniture and fittings can remain well alight for half an hour before there is a spread. In a warehouse or factory "risk" the same hold good. With well-built wooden floors, thickly plugged, and the ceilings perhaps run on wire netting instead of on laths, with ordinary double-ledged doors safely hung, at the most perhaps lined with sheet iron on asbestos cloth, a very stiff blaze can be imprisoned for an hour.

WALTHAMSTOW BATHS COMPETITION.

A MEETING of the Walthamstow District Council was held on Friday evening, says the *Essex Herald*, the purpose being to rescind the appointment of Mr. J. W. Dunford as architect of the proposed public baths, to appoint Messrs. Spalding & Cross as architects, and to ask them to present designs for baths to cost a sum not exceeding 8,500*l.*, and that 100*l.* be offered, without prejudice, to Mr. Dunford in consideration of the cancelling of his appointment. There was a large attendance of the public. Messrs. Spalding & Cross were the first firm of architects who came before the Council in connection with the construction of public baths, and there was an attempt in one quarter to get them appointed, but eventually it was decided to invite competitive plans from Messrs. Spalding & Cross, Mr. Plumble and Mr. Dunford for baths at an estimated cost of 7,000*l.* Designs were submitted by Messrs. Spalding & Cross and Mr. Dunford, and it was resolved that they should be referred to Mr. Plumble, who did not compete, for his award. His report went to show that while in some respects the design by Messrs. Spalding & Cross was superior, that by Mr. Dunford was far more within the limit of 7,000*l.*, and, consequently, Mr. Dunford's design was placed first. After a vast amount of opposition, it was decided to accept Mr. Dunford's design, subject to the approval of the Local Government Board, and he was appointed architect, and his appointment was sealed. When, as a result of the last election, the McSheedyite party gained the upper hand on the Council, an attempt was made to upset the appointment of Mr. Dunford and to secure the appointment of Messrs. Spalding & Cross. This was brought to a head on Friday evening, when the recommendations of the highways committee to substitute Messrs. Spalding & Cross for Mr. Dunford and to extend the cost to a sum not exceeding 8,500*l.* came up for consideration. The meeting lasted fully three hours and was fruitful in scenes, the use of personalities and such words as "lie," "turncoat," &c., being frequent. Eventually the recommendations of the committee were carried by 11 votes to 18.

Mr. Finch, in reply to a remark by Mr. McSheedy, said he thought Mr. Dunford would be foolish if he did not contest the action of the Council.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE opening meeting for the session of this Association was held on the 17th inst. in the Royal Institution, Princes Street. Mr. Thomas Ross, president, occupied the chair, and there was a fair attendance. After some formal business, the Chairman delivered the presidential address, in the course of which he said that, even after all that had been done to remedy the sanitary condition of the community, much still remained to be done. The surface of the streets and the general outward appearance of things seldom presented much that was positively offensive, but every one who had experience in visiting properties for the purpose of valuation and other purposes must be aware of the scandalous condition in which back areas, back greens, sunk floors and cellars were kept in Edinburgh, and that was not in the slums, but in the neighbourhood of the best streets. It was quite possible to step from gilded saloons, adorned with exquisite taste and richness, like some palace of the Arabian Nights, and find one's self in a back area or cellar surrounded by the most utter abominations. There were such places in good properties in Edinburgh, that had not been cleaned since they were built fifty or 100 years ago. That was not a rare condition of things. It was a very common one and it was

possible to find whole areas of back greens where a man of any refinement would shudder before he entered them. Yet it was from those places that the houses received their principal ventilation, and to such places children were sent to play. Proceeding, he said that within the last few months the Glasgow Architectural Association, evidently in the belief that there was a desire throughout Scotland to found a National Institute, took steps to test that by communicating with all the architects in the country. The outcome of a meeting in June last might be stated thus:—That as the formation of a National Institute of Architects would involve the suppression of the Glasgow Institute of Architects, there did not appear to be much prospect of the success of a National Institute. Then the suggestion was made that they should try and obtain their purpose by a federation of the architectural societies of Scotland, and some few details in connection with such a scheme were considered. It humbly appeared to him that that subject should not be allowed to drop, as the formation of a Scottish institute or a federation would be of the greatest benefit to all societies in Scotland and the cause of architecture. He understood that the Council of the Glasgow Institute had reported recently that, in view of the non-success of a former national institute, the proposal was of doubtful expediency. He thought, however, they might be favourable to some kind of extension or amalgamation with a national institute. It was quite obvious that an architectural institution of Scotland could not be formed with any hope of success without the aid of the Glasgow Institute, and if they decided against such a scheme, that, so far as he could see, put an end to it. It was quite different, however, with federation. That, if carefully gone about, could only result in a strengthening of all the societies, and prove a great saving of money to all. In regard to the Junior Architectural Society, he thought there was plenty of room in Edinburgh for both Associations. A vote of thanks was given to the President for his address, and this concluded the proceedings.

GLASGOW ARCHITECTURAL ASSOCIATION.

A MEETING was held in the rooms, 187 Pitt Street, on Tuesday, the 16th inst., the president, Mr. Wm. T. Conner, in the chair, when Mr. F. H. Newberry, head-master, Glasgow School of Art, delivered a lecture entitled "A School of Art." Mr. Newberry opened his subject by explaining that it was his intention to speak from his position as a teacher, and lay before his hearers what were his ideas as to requirements. The object of a school of art, he said, should be to teach craftsmen how to work in any material, and to engender community of thought and criticism between the different branches of study, but everyone should have an elementary knowledge of craftsmanship. As affecting architects, he considered construction and design should be relegated to the office, and the art part only studied in school. On the important subject of lighting, the lecturer said that an account of its steadiness the north light was preferable for beginners, but the south light also was often required as bringing out a variety of colour. Regarding windows he laid down the axiom, one room one window, and that one a plane, *i.e.* no combination of window and skylight, as thus avoiding cross or reflected lights. Mr. Newberry then took up the different rooms in detail, and specified their particular requirements. At the close, on the motion of Mr. P. S. Hill, A.R.I.B.A., a hearty vote of thanks was passed.

TESSERÆ.

Æsthetic Qualities.

ALL qualities of things which make them æsthetic are comprehended under four classes, which, according to their objective difference as well as according to their different subjective relation, produce for our passivity or activity a satisfaction different not only in strength but also in value, and are also unequally adapted for the purpose of the fine arts. These classes are the agreeable, the good, the sublime and the beautiful. Of these the sublime and beautiful alone are proper for art. The agreeable is not worthy of it, and the good is at least not its design; for the design of art is to please, and the good, whether theoretical or practical, can and need not be subservient to sensuousness. The agreeable satisfies only the senses, and is to be distinguished from the good, which pleases the pure reason. It pleases by its content, for the sense can only be affected by matter, and all that is form can only please the reason. It is true the beautiful pleases through the medium of the senses, in which it differs from the good, but it pleases the reason by its form, in which it differs from the agreeable. The good, we may say, pleases by a pure form that is according to reason; the beautiful by a form that is similar to reason; the agreeable by no form at all. The good is thought, the beautiful regarded, the agreeable only felt. The first pleases in idea, the second in contemplation, the third in material perception.

Nero and his Architect.

Nero sat in a wing of Caligula's palace on the Palatine, talking with Celer, his architect. Celer was an artist after the emperor's taste. We do not know if he had an eye for the grand and chaste in the art of Hellas; but a sense of the pleasing, the piquant and brilliant, was his, and to this he joined an attempt at the grand in a superficial sense, at that which wakens amazement by gigantic size and mighty proportions. When his art dreams were not cabinet pieces they were fever fancies, the realisation of which defied all human power. Palaces with roofs reaching the sky, supported by forests of pillars, bearing in their turn high up in the air rocks shaped into statues; vistas, losing themselves in an infinity of colonnades; fountains, casting whole floods as drops into space; marble basins, with isles and oared ships; a world of gold, ivory, mother-of-pearl, of jasper and marble, adorned with the choicest works of Polygnotus's, Parrhasius's and Apelles's pencils, and of the chisels of Phidias, Skopas and Praxiteles—such was the vision he conjured up before the emperor as they looked out over the Forum, Capitolium and Esquilinus. Nero listened with greater delight the looser rein the artist gave his wild imagination. "But knowest thou," continued Celer, "knowest thou, Cæsar, what I see there, high above house and sanctuary? I see the brow of a god, on the temples of which the sunset light yet lingers when it has gone out upon the hills of Rome. I see a giant figure, the like of which the world has never looked on yet, and by the side of which the Colossi of the Pharaohs are dwarfs. The statue is worthy my palace. The vision bears thy features. That brow, from which the sunshine will not depart, is Nero's. But," he added with a sigh, "all that is a dream—" "Which shall become reality," interrupted the emperor. "That promise I expected of thee," cried Celer. "I cannot dream more boldly than thou canst execute. But then, why art thou Emperor, if not to do great deeds? A thousand houses and temples must be destroyed to make room for this one palace—Cæsar Nero's golden house; but thy will is law, and thy might boundless." Some time after this conversation, July 19, in the year 64, a fire broke out in Rome which made more than sufficient room for the projected palace imperial of Nero. For eight whole days the capital of the world was like a huge pyre. Ten of its fourteen districts were consumed, and art treasures of priceless value were lost. The wind, which blew from the sea drove the monstrous clouds of smoke, formed into strange shapes, towards the Apennines, and the people that saw it said trembling the guardian spirits of Rome are flying hence.

The Sistine "Last Judgment."

There is an idle opinion which has been handed down from one writer to another, which is that the style of design of Michel Angelo is altogether confined to one character, of a robust and muscular kind, copied always from the same model, who, as Freart ridiculously says, was the porter of his academy. If this opinion is not altogether false and groundless, yet at least it is shamefully overcharged; and one would not have mentioned it but to put students on their guard that it may not prevent them from allowing themselves all those advantages in the study of drawing with which the works of this great restorer of art will best supply them. This exaggerated censure had been originally ushered into the world with much more moderation and justice and under the sanction of a most respectable name, for a writer of Michel Angelo's own time, on mentioning the *Last Judgment*, says that when he was at Milan a scholar of Da Vinci informed him that his master spoke of it to this effect:—"That the only thing which displeased him in this work was that in so many various aspects there were so few figures, from which cause the muscles were as apparent in the youthful as in the aged, and that the outlines were of the same character." The remark is in some measure just, as applied to the *Last Judgment*, but it is worth observing that it never could have been made by Da Vinci, as he left Rome to go to France in the Pontificate of Leo X., and the *Last Judgment* of Michel Angelo was not executed till near twenty years afterwards, under Paul III. No doubt a considerable monotony of character prevails in the *Last Judgment*, where also his want of general management in the distribution of his objects as a painter (which, by-the-by, he never professed himself to be) is sufficiently evident. But this does not appear in his less extensive compositions in the ceiling, which were painted some years before, when he was in the vigour of life.

English Art Prior to 1760.

Although foreign artists were liberally, nay, splendidly encouraged and rewarded here from the time of Henry VIII., yet we cannot boast of English limners whose works superseded those of Holbein or Vandyke, not to name many others of distinguished abilities who, practising here, afforded our native artists abundant examples of sterling art. Surely, then, the perceptions of our painters must have been more obtuse than those of our poets, many of whose works, fairly competing with

those of the writers of former ages, left all contemporaneous labours far behind; at that period, too, when neither painting, sculpture nor engraving contributed aught to the honour of our national intellect. The dulness of native genius affecting these elegant arts appears to have been, as nearly as may be, coequal to the general apathy, from the king down to the cobbler, touching such pursuits. Painting in particular may be instanced in proof of this, for the public apathy continued and general ignorance prevailed as to the merit of this art, long after certain English professors had proved to the world by their own meritorious labours that painting was no longer a dead letter in the living school of science. Prejudice, however, which governed the opinions of those who might have been expected to manifest better taste, had much to do with this. The leaders of fashion in matters of *virtù* either could not or would not appreciate justly the claims of their countrymen and contemporaries. Hence the public, taking the dicta of these leading connoisseurs for orthodox canons of criticism, concluded that painting on canvas like staining of glass was a lost art. Hogarth was, even by Walpole, his first panegyrist, pronounced to be no colourist, and Reynolds, even in the plenitude of his fame as a portrait painter, obtained no more than 300 guineas for his *Garrick between Comedy and Tragedy*, and for a subsequent work, *The Count Ugolino*, only 400; though the first was purchased by a noble earl and the latter by a noble duke, each reputed connoisseurs. The liberal encouragement which subsequently was bestowed on the arts by Alderman Boydell, a trader in the labours of his ingenious compatriots, induces us to marvel at these past events. Amongst the many operating causes of the change in favour of the living school, we may ascribe the first and principal one, perhaps, to the good sense and foresight of the patriotic band of artists who first projected the scheme of a public exhibition of their respective works. The circumstances which led to this originated, as in many other affairs of still greater national importance, almost fortuitously.

Pavian Romanesque.

Among the other more prominent characteristics of this style it should be noticed that whether forming actual porticoes and galleries or closed up and applied merely as decoration, the arcades were generally small in proportion to the building itself, and instead of occupying the centre width of the front or other elevation were mostly inserted into distinct compartments of it, slightly recessed within the general face of the wall, so that the plain spaces between them assumed the appearance of buttresses or, when narrow, of plain pilasters continued up to the cornice of the gable or roof, and cutting through whatever string-courses or other horizontal moulding (if there were any) divided the different storeys or stages of the edifice. Such buttress-like surfaces—for buttresses they cannot properly be termed—were occasionally more or less enriched, sometimes so much so as to produce vertical lines of ornament continued the entire height of the building, as in the front of San Michele at Pavia, which city may be considered as the cradle of Lombardic architecture. When, as was frequently done, these surfaces were made wider at the angles of the front than elsewhere, they gave an expression of repose and of great solidity to it, serving, as it were, as a frame to the architectural decoration. Among the other peculiarities of this style, that arising from small open galleries immediately beneath the cornice or roof is too remarkable to be overlooked, especially in gable fronts, where the arches of such galleries follow the slope of the roof itself, the columns being successively elevated one above another on steps (so that the base of those supporting the centre arch are above the lower arches), as at San Michele, just mentioned, or else by placing the columns on the same horizontal line and gradually increasing their height, as in the front of Pisa Cathedral. To this may be added the very prevalent custom of making an upper cornice or border of very small interlacing arches, or rather of mouldings producing that appearance. Pinnacles are of rare occurrence, and when introduced have the look of being set on the part they rise above, being separated from it by horizontal mouldings; besides which they are generally low and somewhat resemble pedestals. Pinnacles of this description may be found surmounting pilaster-breaks, and cutting through either an horizontal cornice or the sloping ones of a gable, as in the front of the cathedral at Monza.

English Records.

In the *volumina*, or *scapi*, of the ancients, the writing was carried in equal columns, as in the pages of a book, along the length of the skin, whilst the enrolment in both sorts of English rolls was written across the width of the membrane. Both these kinds of rolls are still used. The rolls of the common law, after the time of Henry VIII., contain so many skins that they cease to be rolls, but become simply oblong books, and, unlike the early rolls of the same series, are exceedingly ill adapted for preservation and inconvenient for use. There are many of these misnamed rolls of the reign of Charles II., which in shape,

size and weight resemble the largest of Cheshire cheeses, often requiring two men to lift them from the rack. Membranes may be fastened together after the chancery fashion in any numbers, and yet remain a legitimate roll, though imposing much bodily labour in the consultation. The Land Tax Commissioners' Act of 1 Geo. IV. extends, it is said, 900 feet when unrolled, and employs a man three hours to unroll the volume. Other records have the shape of books. Domesday Book, called both "Rotulus" and "Liber," the oldest and most precious of our records, counting eight centuries as its age, and still in the finest order, is a book; and as occasions presented themselves for adopting this shape without infringing on ancient precedent, the far more accessible shape which we now call a "book" seems to have been employed. A considerable part of the records of the courts of surveyor-general and augmentations, in the reign of Henry VIII., of wards and liveries and requests, are made up as books. Other documents, those relating to fines, the "Pedes Finium or Finales Concordiæ," the writs of "Dedimus Potestatem," and acknowledgments and certificates, writs of the several courts and returns, writs of summons and returns to Parliament, inquisitions post mortem, &c., by tens and hundreds of thousands are filed, that is, each document is pierced through with a string or gut, and thus fastened together in a bundle. The material on which the record is written is generally parchment, which, until the reign of Elizabeth, is extremely clear and well prepared. From that period until the present, the parchment gradually deteriorates, and the worst specimens are furnished in the reigns of George IV. and William IV. The earliest record written on paper, known to the writer, is of the time of Edward II. It is one of a series entitled "Papyrus magistri Johannis Guicardi contra-rotulatoris Magnæ Costumæ in Castro Burdegaliæ anno domini M^o. ccc^o. viii^o."

Invention in Painting.

As for any rules that may be prescribed to assist invention, they can be but vague at best, particularly for the man who has occasion for them. Those most generally laid down are, that unity of idea be pursued through all parts, principal and accessory, and that all necessary conformity with the circumstances of times, places, usages, characters and manners be continually kept in view. But the successful application of these, and all such necessary observances, must entirely depend on the stock of liberal general education which is previously treasured up in the mind of the artist. Without this adequate education the hands of the painter or sculptor are inevitably tied up from all great undertakings, whatever his natural genius may be; for nothing can be more true than the old adage, "that the painter paints himself, or that the work is always a representation of the author." This is not to be understood, as some have imagined, that either the representation of the artist's face, or the peculiar conformation of his bodily structure is traceable in his works. No; it is the mind of the artist which is visible in what he does; the one must necessarily be an offshoot of the other; they are equally wise or foolish, contracted or expanded, made up of commonplace and gross ordinary materials, or the contrary. From a rude, trifling or ill-formed mind nothing good, instructing, great, sublime, amiable or interesting can be expected. Such an artist may, indeed, attempt to employ his memory, and imitate the celebrated works of others, coldly and at a distance; but he cannot be original without showing himself.

Seal Engraving.

The Greeks carried this branch of the fine arts to the same perfection which their genius and feeling for the beautiful enabled them to reach in all others to which they devoted their attention; but we do not trace its existence among them to a very remote date. It has been supposed that as Homer does not allude to seals they were not used in his time. It is to be lamented that we have no information respecting the process by which the ancient intagliatori (scalptores and cælatores—though the latter term seems to apply more properly to metal-chasers—as they are called by Pliny and others) executed works which are now justly referred to as the best examples of the art. It has been a question with antiquaries whether the lathe was known; but though it is not described by any ancient writer, the works themselves seem to afford evidence of its employment, and Pliny refers to the invention of an instrument which he calls "tornum," which may fairly be supposed to mean a turning machine or tool. It is certain they were acquainted with the use of diamond powder. The modern practice of cutting stones in intaglio is by an apparatus similar in principle to the turning lathe, which gives the cutting tool, placed horizontally, a quick rotatory motion, and the stone on which the design is to be engraved being brought into contact with it, the surface is ground away or indented till the effect required is produced. Instruments of various sizes are used which can easily be removed and replaced, and it is usual, during the process of engraving, to supply the points of the tools with diamond-dust mixed with a little sweet oil.

NOTES AND COMMENTS.

It will be an advantage if that part of the Public Health Act which relates to complaints by a ratepayer against local authorities to the Local Government Board is amended. It may be considered as more economical than a lawsuit, but the Whitehall authorities are difficult to move, and when actions are taken the right to complain is sure to be urged, and impedes judge and jurymen. There is the doctrine of misfeasance, which is entirely out of place in connection with the responsibility for sanitary works. The difficulties attending an action for damages by defective drains were exhibited in a case which was argued a few days ago before Mr. Justice WRIGHT. The plaintiff claimed damages against the Bishop Auckland Urban District Council for injury to his houses caused by sewage. Mr. Justice WRIGHT, when he tried the case at the last Durham Summer Assizes, left the following questions to the jury:—(1) Were the foundations of the plaintiff's houses insufficient? Answer—No. (2) Was the defendants' sewer badly constructed originally, that is, before their time, and, if so, in what respect? Answer—It was badly constructed in consequence of defective joints. (3) Was the defendants' sewer improperly and negligently maintained or repaired by them, and, if so, in what respect? Answer—The sewer was improperly and negligently maintained, because the defendants did not examine the drain the whole length of the street on the second occasion upon which they opened it out. (4) Was the damage caused entirely by the bad situation or bad foundation or bad construction of the houses? Answer—No; it was caused by the water from the sewer. In the Queen's Bench Division, when the case came up for further consideration, the defendants' counsel moved for judgment on the grounds that the flooding was a non-feasance for which no action would lie, and that the plaintiff's remedy was to complain to the Local Government Board. It was not shown that the defendants did anything wrongly, or neglected anything which was necessary. Mr. Justice WRIGHT said he considered the findings were contrary to the evidence, but he had to accept them as right. He believed that all was done in the way of repairs that ought to have been done, but with the findings before him he was compelled to enter judgment for the plaintiff. Stay of execution was granted. Apparently the repairs were executed in small divisions at a time, but as it was known that the drains were not of the latest or most perfect form, having joints without flanges, it is hard to see how the jury, with the evidence before them, could have arrived at any other conclusions than those given in reply to the Judge's questions.

THE late Mr. CHARLES JOHN SHOPPEE, who died on the 18th inst. in his seventy-third year, would have been a very prominent architect if he had lived in a provincial town. But he did not attempt the risks which are required to gain a foremost place in London. His was a safe and, we believe, a remunerative practice. He was an excellent President of the Surveyors' Institute, and was closely connected with some of the City companies. Although a most peaceable gentleman, on three occasions he was chosen to be Master of the Armourers' Company. Mr. SHOPPEE was also Master of the Barber Surgeons' Company. He restored their hall, which was threatened with destruction a week ago, and was a useful representative of the company in helping to manage the Irish estates. He was elected to the Council of the City and Guilds of London Institute. Mr. SHOPPEE also restored Gray's Inn Chapel. But the majority of his buildings were designed for business. The name SHOPPEE sounds English, but it is a corruption of "CHAPUIS," for the late architect was of Huguenot descent, and kept up connection with his fatherland by his office of deputy governor of the French Hospital.

It is the fashion of late years to imitate English manufactures in France, and especially in Paris. We cannot, of course, object to so sincere a form of flattery by a people who are adepts, but why should the atmosphere be also inspired by the fashion? From the deterioration of Paris buildings it would seem as if the air in the city exceeds our London air in the quantity of injurious elements. The

latest victim is the Madeleine. The Corinthian capitals of the exterior colonnade are in so dangerous a condition that several of the acanthus leaves have had to be removed in order to avoid accidents. The subject has come under the notice of the Municipality, and however stingy the councillors may be in voting money for ecclesiastical buildings, they dare not neglect so prominent a building. It is anticipated that the works will be commenced early in the coming year. The church has had a strange history. It was commenced in 1764. On the death of the architect his successor completely transformed the arrangements. NAPOLEON insisted on another transformation, with the object of using the building as a sort of temple of fame for his army. He decreed that on the anniversaries of the battles of Austerlitz and Jena the building was to be illuminated, that there was to be a concert and a discourse on military virtues. The downfall of the Empire suspended operations. In 1816 it was ordered that the building was to become a church, but VIGNON, the architect, adhered to his plan of a temple of victory. The completion of the works was carried out by M. HERVÉ. The Madeleine is unlike any of the churches in Paris, but it is well adapted for grand ceremonies.

THE Orleans Railway Company that obtained the privilege to erect a terminus on the site of the Cour des Comptes in Paris have yet to accomplish a difficult task, for it will be necessary to satisfy a more severe body of judges than was hitherto constituted about the suitability of the design for such a position as the Quai d'Orsay. Among the members are the painters M. PUVIS DE CHAVANNES, M. BONNAT, M. LAFENESTRE and M. DETAILLE; the architects M. PASCAL (the inspector-general of civil buildings), and M. VAUDREMER (Government architect); that is to say, six members of the Institut de France. The following architects are also members of the commission:—MM. HAENTCHEL, BERTRAND, NENOT and LISCH (inspector-general of historic monuments). We find also the names of M. ROUJON (director of fine arts) and three inspectors-general of the Department of Ponts et Chaussées, senators, deputies, &c. In all there are twenty-five members, and it would be strange if they allowed a design to pass which would not be an ornament to Paris.

THE visitors' committee of the Cheshire County Council report that the extensions of the Upton Lunatic Asylum would have been completed next month if the plasterers employed had not given up working. It was found necessary to send to America for substitutes, and plasterers have been likewise engaged in Italy and France. Some of the new-comers were persuaded by the strikers to break their agreement, but the committee are taking precautions to prevent a repetition of the weakness.

OWING to the perversity of a tenant the Commissioners of Public Works in Ireland cannot obtain Kilmallock Castle, which stands in need of Sir THOMAS N. DEANE'S conservative attention. The tenant is a smith, and the stronghold of the DESMONDS is used by him as a forge. Tenant right is now more valuable than landlord right where the latter has survived, and he demands 500*l.* for giving up possession. Eviction is a slow and troublesome process, but it is the only resource in this case. The Irish chiefs cared little for the picturesque, and Kilmallock Castle is so commonplace it does not gain interest by its decay. But it is supposed to have guarded the "Irish Baalbec" in the days of its glory. Not long since it was doomed to destruction, but the Grand Jury of Limerick saved the castle. We hope it was not a useless interference, for unless it comes quickly under the charge of the Board of Works, it may be destroyed by the local vandals.

ECCLESIOLOGIA GERMANICA.

By T. FRANCIS BUMPUS.

(Continued from page 300.)

ALTHOUGH the comprehensive title which has been selected for these papers precludes a lengthy description being given of any particular building or buildings, the comparatively little known character of the Dom at Halberstadt has constrained me to break through my self-imposed rule in this instance. So, before resuming the notes on the steeples and steeple groups of this part of Germany which its description interrupted, I propose making a few remarks upon the interior of what is, to my thinking, the most harmoniously-proportioned cruciform building in this part of Europe.

Next to its narrowness, the leading characteristic of the Dom at Halberstadt internally is its French aspect, the disposition of its nave piers,* and the graceful three-sided apse

the same end from an æsthetic point of view, viz. that prolongation of the clerestory windows to the string-course above the pier arches which adds such dignity and richness to the internal elevation of Ratisbon.

The unrelieved space left between the apex of the pier arches and the string-course of the clerestory, is not so disagreeably apparent at Halberstadt as in the examples to which I have just alluded; but while a small unpierced portion of the clerestory windows does in a measure answer to the Ratisbon Cathedral arrangement, yet relief to the bare interval of wall above the arches would certainly have improved the *ensemble*.

The prevailing hue of this elegant church internally is a greyish white, one that would be materially softened by painted glass, in which the aisles and clerestory of the nave are entirely deficient.

An immense organ by Heinrich Herbst of Magdeburg (1718), but almost entirely rebuilt in 1838 by Schulze, forms, with its nobly carved case, a magnificent termination to the view westward, towering as it does to the roof and completely

CATHEDRAL OF TOURNAI, FROM THE GRANDE PLACE.

terminating the vista, so agreeably broken by the exquisite Late Pointed rood-screen, being strikingly reminiscent of the cathedral of Tours.†

Such great German churches as Freiburg-im-Breisgau, Magdeburg, Metz, St. Sebald Nuremberg, and Ulm are unfortunate in desiderating a triforium range,‡ or what answers

* See *The Architect*, October 8, 1897.

† In the French example the rood is wanting. That beautiful and, it may be added, indispensable feature to a Pointed church being, as almost everywhere in France, wanting at Tours. A tall, nondescript iron gate ill supplies this deficiency.

‡ It seems not a little strange that the triforium should be absent from the Middle Pointed buildings of a people who showed what a noble feature it could become in such churches of the Romanesque and Early Pointed epochs as Neuss, Andernach and Limburg, where it goes under the name of Männerchor. Strasburg and Cologne Cathedrals are the only two great thirteenth-century Gothic ones possessing *bona-fide* triforia.

occupying the west end, above the gallery in which it is placed. This gallery has an elegant parapet pierced with quatre-foiled circles, and from its centre a species of small corbelled pulpitum projects. A wide Pointed arch springing from capless piers, and having a large quatrefoil circle in each spandrel, supports the whole.

The nave is fitted up for the Lutheran service with good and substantial, but heavy-looking, pews, having huge poppy-heads, on the "motif" of the old woodwork in the choir, to their ends. A few feet in advance of the central arch of the rood-screen,* which stands beneath the eastern arch of the crossing, is placed a stone altar having a painted front in lieu of antependium, and furnished with a crucifix and pair of candles. Some timid advances towards a more ornate ritualism seem to have been made lately in the Lutheran churches of Germany—such as the employment of coloured altar frontals for the

* As it is proposed to devote a special section of these Notes to the roods of Northern Germany, its description is at present deferred.

various seasons of the Church, which I notice have been adopted at Herford and Naumburg. In some of the Erfurt churches of the Lutheran persuasion I found vases of flowers in addition to the customary crucifix and lights on the table.

Passing within the screen, the old choral arrangements of the five-bayed eastern limb seem comparatively undisturbed. The stalls and Bishop's throne, which latter, as at the Protestantised cathedrals of Meissen and Naumburg, stands at the west end of the choir facing the altar, are fine specimens of wood-carving; three standards for lights of three branches apiece are disposed at intervals up the centre of the choir; and some rich tapestry, the canopied figures bracketed against the piers, and the Late painted glass, of which the windows of both aisle and clerestory boast a goodly supply, unite in composing a most picturesque architectural *ensemble*, one that would be materially enhanced by an amelioration of the mean arrangements of the altar, and its equipment with the crucifix and lights. There is no reredos, and a beautiful vista, terminating in the painted windows of the apsidal lady chapel, is thus obtained.

Passing into the choir aisles, a deterioration in workman-

of an autumnal leaf—look remarkably well, rising from the slender towers with their gables and graceful belfry windows. The mention of these steeples warns me that it is time to quit this fascinating building, and to resume the thread of my notes on that section of the subject which arrival in Halberstadt caused me temporarily to drop.

Although the architecture of this part of Germany, be it Romanesque, Pointed or Flamboyant, is superior not only to that of Westphalia and of the provinces bordering on the Baltic, but in some respects to that of the Rhine, there are no steeple groups in Saxony which impose the visitor at a *coup d'œil* like those of Gelnhausen, Limburg, Speyer, Andernach or Cologne. Neither can it show anything to compare with that extraordinary group at Tournai, one which for our purpose may be considered as thoroughly Teutonic, and of which I am able to furnish an illustration from the facile pen of Mr. W. A. Hanson; but Naumburg, Erfurt, Halle, Freiburg-on-Unstrutt, Muhlhausen, Arnstadt and the Liebfrau-Kirche at Halberstadt will not prove altogether disappointing in this respect, if they do not combine into such fascinating groups as those named in

W. A. Hanson

The Eastern Steeples
Naumburg

ship is very evident, the groining ribs springing from their slender shafts without the intervention of capitals. There is, however, some really beautiful detail, especially a narrow doorway in the south aisle having a sculptured Nativity in its tympanum. The Germans excelled in small bits of detail like this. One chapel—that of the Blessed Virgin—alone opens out of the circumambient procession path, upon the awkwardness of whose planning I had occasion to animadvert in a former paper.

Excepting, perhaps, a certain feeling of confinement, the prolongation—at the point called by the French the "Pourtour"—of the wall connecting the extremity of the aisles with the lady chapel obliquely, in lieu of continuing it due eastward to meet an apse, is not quite so disagreeably forced upon the spectator as when viewing the church externally.

From the upper storey of the cloisters, of which I shall say something when reviewing these entourages generally, the whole south side of the Dom is visible at a glance. Hence, the tall, modern Lübeck-like western spires—the colouring of whose metal-work assumes under certain conditions of light the tint

of the first list. As a rule the Saxon steeples, when four in number, are placed in pairs flanking either extremity of the church. As we are supposed to be still in Halberstadt, we will take the last-named example of spire groups first—that of the Liebfrau-Kirche. This is a most interestingly untouched eleventh-century conventual church, of exceedingly simple Romanesque architecture, and retaining its original flat wooden roof. It is equipped with four steeples. The eastern pair—tall octagons capped with spirelets—occupy the angle formed by the nave and either transept. Usually the eastern angle is chosen for their *locale*. The western pair are square towers, gabled on each side, and crowned with quadrilateral stone spires of the Rhenish type. I may add that additional dignity is imparted to the western elevation of this church by raising the façade between the steeples considerably above the roof line, after the fashion of the screen façades of Goslar, Brunswick and Gernrode, but the arrangement in this instance has a far greater appearance of solidity and grandeur, being coextensive with the depth of the steeples and transversely roofed with a gable in a *bona-fide* manner.

The cathedral of Naumburg was originally planned with four steeples, but it has only attained the fulness of this dignity within the last quarter of a century, during which great and salutary restorations and ameliorations have been carried out in the fabric of this most interesting German church.*

The Dom at Naumburg, of which it will be remembered a slight description was given in the first number of this series of papers, consists of a nave with aisles and transept in Transition between Romanesque and Pointed—or, to speak more strictly, in a style which titubates, like Münster, Osnabruck and Trèves, between the latter and the former protean one—and to which a "choir" of Early and Middle Pointed Gothic has been added at the west and east ends respectively.

Occupying the angles formed by the eastern choir with the transepts is a pair of steeples in Romanesque. These are carried up square to the same height as the walls of the choir and transept, the corbel-table being continued right round, and seeming to bind the three limbs together in a very satisfactorily

* Naumburg is described in the second volume of *The Sacristy*, a short-lived publication which, it was hoped, would have taken up the work that *The Ecclesiologist* had dropped shortly before the appearance of its first volume in 1871. Naumburg Cathedral was then in a deplorable state, its internal arrangements deserving to the full the censures passed upon them by the writer of the article. Among some of the most interesting contributions to this ephemeral publication were "Embroidery," by J. Aldham Heaton; "Gregorian Music," by Rev. H. Fleetwood Sheppard; "Some Thoughts on Modern Parish Churches," by J. T. Micklethwaite, who also contributed a paper on the completion of St. Paul's, where the present arrangement of the choir fittings was at that time (1870) under consideration; "The Anabaptists of Münster," by Rev. S. Baring-Gould, &c. The tone of all these articles was much more advanced than that of *The Ecclesiologist*, in the volume of which for 1855 there was an excellent account of Naumburg from the pen of the late G. E. Street.

solid manner. They then take an octagonal shape, and are capped with bulbous slate cupolas. These last, as well as the uppermost stage, betray the hand of the Late Pointed architect, and, while not a little picturesque, will scandalise the purist.

One of the Western Steeples Naumburg

The square portion of these towers opens, on the ground floor, into a small apsidal chapel. The next stage contains other chapels approached from the aisleless eastern choir, which, it will be remembered, is raised some 16 feet above the level of the nave and transepts, being elevated upon the crypt, whose floor is only 4 feet lower than the pavement of those portions.

The western pair of steeples seem to have been rebuilt when the elegant choir at that end of the church was projected, early in the second half of the thirteenth century. Until within the last twenty years the southern steeple had not risen above its square substructure, while the northern one had been completed with the exception of its pinnacles and spire—a fantastic dome forming its capping, as shown in Puttrich's book on the architecture of Saxony. Now, both have been finished, and with their elegant angle tourelles recall the steeples of Laon to

those familiar with the architecture of the country lying around that city, Soissons and Rheims; and few districts of Europe can show such a galaxy of churches as this. Pinnacles and slate spires of not very felicitous outline now crown these western steeples of Naumburg. Bamberg Cathedral has a similarly outlined pair of western steeples. I am indebted to my friend Mr. Hanson for the extremely spirited drawing which he has furnished of one of these towers, thus precluding a detailed description. This I have chosen in preference to a more distant and generalising view, as it enables the student to form a closer acquaintance with the beautiful Early Pointed detail in which it abounds. The carving of the cornice to the lowest stage is unusually good, and is carried right round the eaves of the western choir. The manner in which the natural foliage springs upwards and fills a large hollow with its ramifications is among the best I have seen in Germany; indeed, one is inclined to doubt not only the parentage of this detail, but of the upper storeys of the steeples generally.

(To be continued.)

PROTECTION AGAINST FIRE IN MUSEUMS.

ONE of the subjects to which the Select Committee on Museums of the Science and Art Department gave most attention was the provision against fire. It was notorious that the buildings of the

South Kensington Museum

could not be called fireproof in the lowest sense of that much-abused word. Mr. Edward Street, who had been instructed to examine them in 1893, gave a general opinion of the case in the following words:—

"Upon studying the buildings and their contents, one is first struck with the great beauty of effect as one walks through the various galleries, and a systematic series of visits, such as I have lately been making, greatly strengthens this impression upon the mind. One is still more deeply impressed as to the value of the collection brought together, and with the knowledge that, as regards many of the exhibits, if lost they could never be replaced; and this must not be lost sight of in considering the buildings in which such a priceless collection of beautiful objects is housed. One is astonished most of all at the apathy or condition of things that has permitted a series of old buildings, built of wood and lath and plaster, and in many instances covered with tarred felt, to go on existing from year to year in close proximity to such a collection of art treasures as I have referred to; and, further, that this danger should have been aggravated by the erection of a further series of large temporary buildings constructed of fir framing, and covered, it is true, on the outside with iron, but lined internally with varnished matchboarding. Nor is fire the only element that would be disastrous to the collections. One's experience as a fire-office surveyor leads one to the conclusion that almost as much damage is done by smoke as by the water and in extinguishing fire or embers as by the actual fire itself; and it is scarcely necessary for me to point out to you that water falling from a hose on to the Raphael Cartoons would have results that all lovers of the art of past ages must shudder to contemplate."

Some of the buildings are so dangerous Mr. Street considered they would not be insured on any premium that could be offered, and he added, "their preservation to the present time speaks in loud praise of the care and watchfulness of those who have had the care and charge of the premises and their contents."

The need of safety was so urgent that the committee were compelled to adopt the unusual course of preparing an interim report which contained a strong representation that the permanent buildings which are required should be proceeded with without delay, and according to the committee, it would be a grave discredit to the country if the settlement of the matter by Government were longer delayed. The evidence given by Major-General Festing, R.E., before the committee reveals the constant care which has to be taken in order to avoid a catastrophe.

The Chairman: Have you charge of the arrangements in the case of fire?—Yes.

Let me ask you generally, what is your opinion as to the safety of the buildings?—I think that the safety of the buildings depends absolutely upon the watching; that is the one thing. Many of the buildings are extremely inflammable. When I say that, that is perhaps rather strong, but they are more inflammable than public buildings ought to be, certainly, and I think it is only by extremely careful watching that we can feel any measure of security at all.

Is the watching of the buildings organised by you?—Yes, of course as a police matter.

Day and night?—Yes.

What provision have you in the case of fire; have you any immediate provision?—We have fire extinguishing apparatus all over the building; we have water mains right through the

buildings, with hydrants here and there; we have a certain number of small hand engines, and hand pumps and extinguishers, and we have a detachment of Royal Engineers who live on the premises.

Have you ever had a fire in your time?—We have had one or two, but they have been very trifling. Some years ago we had a fire in a sunlight flue in the museum; some woodwork which had been put to trim the opening of the flue somehow or another had not been properly protected originally, and that caught fire from the heat of the sunlight; that was put out in a very short time with one of these hand pumps.

Lord Balcarras: What was the date of that?—I cannot remember.

Is it twenty years ago?—I should think probably as much as twenty years ago. We had a small fire in one of the wooden buildings which is used by the professor of astronomy; that was seven or eight years ago, I think. In connection with the photographic work there was a drying closet which got overheated. That was put out by the men before the arrival of the fire brigade, and very little mischief was done. We had a fire of larger dimensions, not in our own buildings but in the buildings which were alongside the exhibition, the Inventions Exhibition, I think it was. They were buildings which had been erected originally as temporary buildings, and either from the overheating of a flue or from sparks from the flue, the roof of that building caught fire. It was a roof constructed in such a way that it was extremely difficult to get at, and the whole of the roof of the building was burned.

Can you tell us precisely when that occurred?—That was at the time of the Inventions Exhibition, which was in 1884 or 1885.

Mr. Acland: Do you give an alarm from time to time the same as the alarm is given on board ship for fire drill?—Yes. Sometimes the alarm goes off itself. We have the electric system of alarms all over the buildings, and sometimes they give an alarm when nobody gives it, so that the men get a certain amount of practice in turning out—quite automatically, as one may say.

What appliances have you? Have you a manual engine?—We have two manual engines, but we really never use them; at least, when I say we never use them, I hope we shall never have to use them. Our detachment of men now is not large enough to work a manual engine. We have water-mains all over the building, and hydrants at different places and hose kept in readiness. Of course, two men or three men with a hose at a hydrant can do as much work as eight men at a fire-engine.

Are your hydrants and pipes all through the building and accessible to every place where fire is likely to occur?—Yes; I suppose there is no place in the building which you cannot reach from a hydrant with perhaps two lengths of hose.

And are your high-pressure mains all over the building, in every part?—Yes; by high pressure I mean only the high pressure of the water company. In addition to that we have a high-pressure apparatus.

A hydraulic injector?—No, an air apparatus, by which we can discharge 2,000 gallons of water at the highest pressure.

Is that available over all parts of the buildings?—Yes, because it can be put into connection with the whole system of mains. We have that because some of our highest roofs are not very well commanded by water company's pressure.

What is the method of the patrol of your firemen at any time?—They do not patrol.

How many of them are there on duty at night-time?—They are divided into two pickets, half one day and half the next, and that half are on duty the whole twenty-four hours; they cannot leave the premises at all; and of the others not more than two can be out the whole night.

Are there fixed call points that the men turn a key at in the different galleries?—Yes; there are alarms distributed about over the galleries which cause a bell to ring just outside the barrack-room; inside the barrack-room is a dial arrangement, by turning the handle of which dial, when the bell stops ringing, the pointer shows the number of the bell that has been pulled, therefore they know where to go to.

Therefore the sergeant or officer in charge at the barrack-room knows when the fireman has gone up to or gone by a given point. What is the connection between the fireman who turns his point, so to speak, and the officer on duty?—The alarm is sounded by the policeman who is patrolling the gallery; supposing he sees fire, he has to pull the alarm at the nearest pull, and then the men know where to go to.

But apart from the actual call for fire which is communicated by a policeman, say, to another policeman or to your firemen, do your firemen periodically, irrespective of fire, let someone know either next day, or the officer on duty at night, that they have been by a certain portion of the building?—The firemen do not patrol the building, the policemen do; the policemen who patrol the building set the tell-tale clocks.

What do the firemen do?—Nothing until they are called or; every evening they test these fire alarms to see if they are

in proper order. When they leave off work at six o'clock or so, after they have had their tea, they test the alarms to see that each of them will ring and is in proper order.

I gather from you that the patrolling of the galleries, both as to theft or fire, is done entirely by the policemen, and in the event of a call being given, your firemen in the barrack respond?—Yes.

How often is your fire gear and your hose inspected?—Every day; the sappers look round it every day.

How often do you put your hose on to the hydrants?—Every week the men have a drill; they cannot do the whole of it in one week, but they arrange to do from one day to another, and one part to another, to see that it is all right.

When was it last tested?—They had a drill last Saturday.

Was everything satisfactory?—Yes; at least, nothing was reported unsatisfactory.

How often do you subject the firemen and the police to what I may term a test call or a test drill?—We have never subjected the police to a test call; as to the firemen, not at regular periods, but if I happen to be about some time in the night I may pull the call and summon them.

For both the police and the firemen?—For the firemen. The police do not want to be called together; they want to remain on their beats. The firemen I want to call together to work.

Have you ever asked the chief of the fire brigade with you to concentrate his engines from the adjoining station on the Museum by way of a test?—No, because when the fire brigade comes in, I think it much better that my men should be withdrawn and leave the fire work entirely to the fire brigade; my men would then come in much more useful in looking after moving any cases and property of that sort in the Museum.

What I want to know is, have you and the chief of the fire brigade ever met, and subjected both the Metropolitan Fire Brigade men and your own men to a supposed conflagration at South Kensington Museum, to see with what rapidity they could get there?—No.

You have never had the brigade there for any fire?—The brigade came, as I said, for that small fire at the Astronomical Observatory, and they also came to that fire in the temporary building by the Inventions Exhibition, and I believe they came (long before my time) when Mr. Braidwood was chief of the fire brigade.

There would be no disadvantage to either the Museum staff or to the brigade if occasionally that were done; do you think there would?—No, I should think not.

Bethnal Green Museum.

Major-General Festing was also questioned about the condition of the Bethnal Green Museum.

Mr. Bhownaggee: Is the nature of the Bethnal Green Museum building such as to expose it to great risk of fire?—No, I think no great risk; of course it has a wooden floor, and as long as you have a wooden floor you have stuff that will burn, and stuff in which fire will no doubt spread, but, on the other hand, it is a detached building and there are no fireplaces in it; when you are once inside the building you practically almost command the whole of the inside, you can see the whole of it, and therefore I should say it was not a building that was exposed to great risks.

The wooden flooring is the real part of the building that exposes it to a good deal of risk?—Yes; one can quite conceive that if there were a large fire in the neighbourhood, flakes of fire might come through the skylight and, pitching on to the wooden floor, there would be something for them to get hold of; on the other hand, I say the interior of the building is so clear that one man with a hose inside of the building would be able to attack a thing of that sort very quickly, and therefore I should say that the risk from fire is not very high there.

If the flooring caught fire it would be the most dangerous part of the building to catch fire?—Yes, it is a part of the building that is possible to catch fire.

Would it be easy to replace by some less inflammable material?—It is a matter of expense.

Would it be very costly?—It would cost a good deal. It is rather a difficult question, and in order to make a strong fireproof floor, you would have to do a great deal to the actual supports of the building, as they are at present. I do not know whether you would have to alter the iron columns which support the floor at present, but of course it could be done; and it is a matter of expense.

And you do not think that expense would be well incurred in making the building entirely fireproof if that wooden floor is the only combustible matter. Are there any arrangements for putting a fire down there?—We have hydrants and we have small hand-engines, and we keep three men always in the foreman's quarters close at hand there.

Edinburgh Museum.

General Sir R. Murdoch Smith was examined about the safety of the Edinburgh Museum.

Sir H. Howarth: How long have the present buildings been built?—They have been built in three portions; the east wing and a portion of the centre hall were begun in 1861, and then a number of years afterwards the second portion of the central hall was added, with the halls at the back; and the west wing was finished in 1888.

Have you had the responsibility of recommending any one of these buildings?—No, they are all built on the original plan, with slight modifications.

Have they all top lights or sunlights?—All top lights, with the exception that in the wings the halls to the front have floors, so that they form three halls, one above the other, and, of course, the two lower ones have no top lights; all the rest of the building is arranged in halls with galleries round the halls, and top lights throughout.

What access is there to the galleries?—By stairs; there are two stairs at each end of the great hall, from the ground floor up to the first floor, and then from that floor up to the next.

Are you satisfied that the buildings as exhibition-rooms are excellent?—I think they are excellent; I think it is the best lighted Museum I have ever seen.

I think so too. With regard to danger from fire or otherwise, are you satisfied with regard to their safety in that respect?—I think so; every possible precaution is taken, and we have a very complete set of fire apparatus in every part of the building, and that apparatus is inspected every month by one of the assistants, who has special charge of that, and with him there is always one of the other officers, two of the attendants, two of the police and one of the artificers who go in turn; so that in the course of a few months every officer and every man in the Museum has taken part in the inspection of the fire apparatus, which is also tested once a quarter with water; it is not tested every month with water because of the great mess it makes in the building.

Mr. Gray: You told us that in your opinion the buildings are admirably suited for their purpose?—I think so.

What is their construction, stone?—Stone, and glass roofs.

Practically fireproof?—Well, I should be sorry to say that they are exactly fireproof, but the basement is all vaulted and the whole of the ground floor is cement covered with tiles; the galleries cannot be said to be fireproof with wooden floors, but taking it altogether I think it is very safe from fire.

Are there means for separating the central building by fireproof doors, or anything of that kind? None; there are large archways.

What is the lighting, gas?—It is gas.

Are the jets exposed?—They are exposed; they are on long rods.

Have you no electrical installation?—None whatever.

Why?—Because the Treasury did not sanction the cost; it has twice been brought before the Treasury, and it is to be hoped it will pass some day.

That, I understand, is your strong wish?—Very much so.

Both in the general interests of the safety of the collection?—Both for safety, and especially for cleanliness; the amount of soot and dirt caused by the great amount of gas-lighting in such an immense building is so great that I believe the cost of simply repainting the building inside would very nearly pay for the installation of electric light.

That is, you have a collection there valued at something like 120,000?—One hundred and twenty thousand pounds odd.

All exposed to the damage from dust?—They are protected by cases; but the building itself is made dingy and dirty by the gas, and all exposed objects, like architectural casts and so on, are also exposed to the dirt caused by the gas.

Do you know when the last application was made to the Treasury?—Well, it was sent this last year for this current year's estimates.

And still refused?—It was refused by the Treasury. The Office of Works, I know, sent in an estimate.

What was the amount of the estimate?—I have no idea; that belongs to the Office of Works.

Have you ever gone into the question yourself as to what the additional cost would be as between gas and electricity?—I do not believe it would cost more than gas, when once the installation was paid for.

The initial cost of the installation?—Yes, because I believe the cost of the current in Edinburgh is very cheap, only 4d. a unit.

That is, you propose to take it from existing supplies, and not from any special supply of your own?—Precisely; from the supply provided by the Corporation, which is now supplied all over Edinburgh.

And as to the heating?—That is by hot-water pipes at low pressure from furnaces placed in the basement.

There is no danger likely to occur to the building from that?—I think none whatever, because the basement, as I have already mentioned, is vaulted in stone throughout.

Dublin Museum.

Lieut.-Colonel Plunkett gave evidence about the watching in the Dublin Museum.

Sir Henry Howarth: What is the protection at night; are there any of the under officials who live on the premises, who sleep there?—There is only a gatekeeper belonging to the museum sleeping there at night, one of the porters, but the metropolitan police of Dublin take charge of it, and they have members day and night in the museum, and there is also a fireman there of the Dublin Fire Brigade all night.

Do they divide the responsibility of custody with the civilians who are not police at all?—During the night they have the entire custody of the buildings—the police; there is nobody else there. The gatekeeper is sleeping in his house, which is close to the gates, but it is detached; although it is only about 30 or 40 yards to the museum, it is not in the building. The police and the fireman are the only people in the building at night.

Have you any boilers or other things necessitating fires in the building?—The heating apparatus is in a vaulted underground building shown upon that plan which I have handed to you, just adjacent to the museum.

And you think it fairly safe?—It is a fireproof vault, and I think there is no danger whatever of fire from our heating apparatus; the electric-lighting apparatus is also there.

Mr. Bartley: Do you make your own electric light?—Yes, we have our own installation.

Sir Francis Powell: As to the safety of the buildings as regards fire during the night, are you satisfied with the present arrangement?—Yes, I think the present arrangement is a very good one against fire. The fireman and the Dublin Metropolitan Police have regular practice at which officers of the museum attend in turn, and the attendants and labourers and the men in the workshops all attend; there are hydrants all over the building, and the fireman is there on bunk duty at night—that is, he sleeps there in his clothes ready to get up at a moment's notice.

Does he patrol the building?—He sleeps; the police patrol the building.

Is there a night patrol?—A constable patrols it all night.

So that the building is never left?—Never left.

Mr. Daly: Is the collection in the different branches of the Dublin Museum a very valuable one?—Yes.

Is the collection insured?—No; the Government never insure any collections, I believe.

Do you think they should be insured?—No, I think that fireproof buildings should be provided, and of course every possible precaution taken against fire. I think if that is done insurance is unnecessary.

But then, are the buildings fireproof in the Dublin Museum?—The buildings proper, the permanent buildings, I think you may consider fireproof; they have very little wood or anything inflammable in them at all. The temporary buildings in which are at present the fossil fauna and some of the geological collections and a few other objects are temporary buildings and they are not so, I was going to say not so fireproof, but I am not sure I am quite right there; they are not safe from fire on account of various stores and temporary buildings in and about them.

Are there portions of the Dublin Museum buildings fireproof?—What I should call the museum proper I should call fireproof, but some of these temporary buildings, which we hope will be removed within a short time to make room for permanent buildings, although fireproof themselves, being built entirely of brick with iron roofs, are so crowded up with objects and fittings that I do not consider them safe from fire.

So that if fire occurred on account of the congested state of the objects in the place great damage would be done, I suppose?—Great damage would be done, but I do not think there would be any fear of the main museum buildings, in which the most valuable part of the objects are, being involved in the fire.

And I presume you have no fire brigade?—We trust to the Dublin Metropolitan Fire Brigade. They arrange for fire practice with our men once a month, at which the officers attend in turn and the attendants attend regularly, and also they provide a fireman who is there all night.

In case the assistants lived on the premises of the Dublin Museum would you say that they should be trained to have some knowledge of extinguishing fires?—They are so trained at present; they have to attend the fire drills and learn under the superintendence of the Dublin Fire Brigade.

They live at a distance from the buildings?—They do.

They might be the last to attend in case of fire?—That is extremely likely.

That is a curious method of having a brigade?—Of course we have electric communication with the fire brigade, and the fireman and police on the premises would summon them.

British Museum.

The system adopted in the British Museum was described by the principal librarian, Sir Edward Mavnde Thompson.

Mr. John Burns: What is the total number of police you have on at night?—Four and a sergeant.

Beyond those there are the firemen?—Yes.

How many on at night?—Two firemen always on at night.

Do the police in charge at the British Museum, beyond doing police duty, do firemen's duty?—They are all practised in fire-drill, and are all available.

And the police know the fire-drill?—Yes.

And they work harmoniously and automatically with the firemen?—Yes.

Do both the firemen and police wind up a clock at certain hours?—Yes; with regard to the four police on duty, I should explain that three are outside at night; there is one at the gate and one on each flank; there is one locked up inside to guard the gold and medal rooms, and he has to keep on pegging two tell-tale clocks. A fireman also patrols the basement at night and pegs a tell-tale clock.

There are no commissioners on duty at night time?—No.

What is the general system of your fire arrangements?—Do you mean the water arrangements?

Yes; is it high-pressure?—Yes.

What pressure; can you tell me?—Yes, I think I can tell you that; it is from 40 to 60 lbs. In the night time it runs up to 60, but in the day time it slackens, being drained off in other directions, but it does not fall under 40.

Who has the mechanical administration of your pressure and your hydrants and hose, an engineer?—No, they would be under the chief fireman.

Is your chief fireman an engineer, or is your chief engineer a fireman?—No, we have not an engineer; the man who would be really responsible would be the clerk of the works.

And under him the fireman?—Yes.

How often are these tested?—They are tested officially once a quarter, but we have monthly inspections, and, of course, the men are constantly testing the hydrants all round the place; when polishing up and cleaning they test the things.

But officially you have your quarterly test by the chief of the fire brigade, and tests by the clerk of the works and the chief fireman whenever they may think necessary?—Yes.

Do you see these tests?—I personally? No. The chief officer of the Metropolitan Fire Brigade sees that. I know all about it personally. I know the arrangement perfectly well.

Do you know if the pattern of your hydrants and your gear is the same?—Just the same as the Metropolitan; everything is interchangeable.

And you consider that an advantage?—Decidedly.

You having the four firemen you have mentioned, you are on the telephone with the chief officer and the local fire staff?—Yes, we are on the telephone with Theobald's Road fire station, which is the nearest, and with Scotland Yard and the Tottenham Court Road police-station.

Who furnishes the four firemen in the museum?—They are men who have come on; they are our own men. I do not like the system, and we shall try if we can by degrees borrow them or hire them from the brigade, as we do the police from the Commissioners. We have tried to do that, but at present the County Council have asked such a large sum for the firemen that the Treasury will not let us hire them.

We are just discussing the terms for you, I may say. These are men who have been in the brigade, and have been taken on by you?—Yes.

And now inspected by the chief of the brigade?—Yes.

Have you ever had with the chief of the brigade a test call to the museum?—Yes, urgency calls. We have had two in my recollection. Captain Shaw brought up seventeen engines, I think; and about six years ago we had a test—we got, if I remember aright, six engines up in ten minutes.

You are in favour of the present system of fire administration?—Except that I should prefer to have our firemen hired from the brigade.

The fact that the chief of the fire brigade occasionally inspects in no sense interferes with your administration of your staff?—Not at all.

Can you conceive a better method of fire prevention than that which prevails?—No, I think ours is very good; we have high pressure all over the place—about 100 hydrants. We have a reserve in the way of tanks on the roof carrying about 23,000 gallons, and we have gear all over the place put about in boxes in different stations; every point can be commanded, and we have 8,000 feet of hose. The other day the local inspector came round, and told me that he had never seen a place so well equipped.

The fact that occasionally the officer of the fire brigade, the chief of the fire brigade, comes in and sees that you are all right, in no way interferes with either the discipline or administration of the museum staff?—Not at all.

Do you keep the gangways and passages in the museum of sufficient width for the hand engines?—Yes, we are always careful of that—to run the hose rather. We keep the gangways clear to run the hose.

Do you keep the gangways between your cases and your nooks and between the art objects, whatever they may be, of sufficient width?—Yes, we always keep sufficient room to run our hose.

Do you make that a cardinal rule of your fire regulations?—We make it a rule in arranging our objects not to interfere with the gangways.

Mr. Bartley: Can you tell us, with reference to the precautions for fire, are all your floors fireproof?—Practically, I think they are. If you take the basement, I think we might run a fire right through without touching the upper part.

What about the floors above?—Some are wood.

They are not fireproof?—But they are very hard wood, and closely laid, and they would be very difficult to burn.

What about the roof?—It is coppered.

Is it not made of timber?—Well, I cannot tell you that; there must be very little timber in it; it is mostly girders.

When was it built?—About forty-five to fifty years ago; I think the museum was finished about 1846 or 1847.

Is it not almost certain at that period that it would be made largely of wood?—I think it is a great deal girder work.

The gutters?—Iron girders; I know that in cutting ceilings we have to go through girders.

It is not a modern type of fireproof roof, I suppose?—I do not suppose it is.

Do you think it would be desirable that it should be so in future building?—In future building, of course, we should take the newest patterns of things.

Do you mean to say that in the whole of the British Museum there is only one man walking about inside at night?—Down in the basement there is a fireman always patrolling, and the sergeant of police goes his rounds as well.

Then it is not strictly correct that there is only one man inside?—We put him into that department because of the special value.

It is a very large place, of course?—Yes; but, of course, there are constant patrols, you understand. I suppose your question is put with a view to the safety. You will, perhaps, allow me to explain that we have patrols at certain times. We always have a patrol when the public are turned out, to begin with, consisting of the messengers, police and firemen, and so on. Then an hour afterwards the museum is always patrolled again, so that, for example, we turn the people out at 10 o'clock at night, and there is a patrol goes round at 11 through all the part that has been open to the public.

There are patrols outside always?—Always.

NORTHERN ARCHITECTURAL ASSOCIATION.

THE opening meeting of the Northern Architectural Association's winter session took place in the Art Gallery, Grainger Street, Newcastle, on the 17th inst. The following letter was read from Mr. William Glover:—

16 Market Street, Newcastle-on-Tyne:

November 17, 1897.

"To the members, Associates and students of the Northern Architectural Association.

"Gentlemen,—I have often thought that as our Association is one of the most important of the allied societies its president should wear an insignia or badge to correspond with those of the presidents of other kindred societies, and that it would give me much pleasure to present one. I have always taken a great interest in the welfare of the Association, and as you have done me the honour to elect me on your council for over three-fourths of the period of my membership, and the further honour of electing me vice-president for three years, I have felt that I would like to show my appreciation of your kindness to me and my regard for the present president, my old friend, Mr. F. W. Rich, who has done so much for the Society, by presenting to the Society a badge to be worn by the president and his successors during their year of office. In this spirit I have to ask you to accept from me the accompanying insignia or badge. I am indebted to our esteemed friend, Mr. W. S. Hicks, for the design, which I am sure you will agree with me is very beautiful, and combines artistic thought and skill in every line; and I may add the work has been carried out by the Goldsmiths and Silversmiths' Company, London, in a most artistic manner to the complete satisfaction of the designer and myself. Trusting the badge will be acceptable to the members, and with my best wishes for the future success of the Association.—I am, gentlemen, yours very sincerely, WM. GLOVER.

"A. B. Plummer, Esq., hon. secretary,
Northern Architectural Association."

The badge, of 18 carat gold, is oval in form, with beaded mouldings, between which is the name of the Association in dark blue enamel. In the centre, carried out in proper enamel colours (red, white and blue), and in high relief are two shields bearing the arms of Northumberland and Durham, having the square and compass below. An entwined ribbon on one side with the motto "Super Justitia Ædificata" (upon Justice built), and on the reverse side an ornamental lambrequin; above the shields composed of platinum is an antique helmet and the castle crest.

The President proposed a vote of thanks to the generous donor. Their friend, he said, did not believe in half measures; everything about the present was of the best. The occasion must be their rallying point. The badge must be held in the same manner as the mace at the House of Commons. It must always be on the table when business was afoot.

Mr. Oswald seconded. In doing so he referred to the many years Mr. Glover had interested himself in the welfare of that Association, and how assiduous he had been. He had bought prizes for the students, and had made additions to the library, and had presented two albums to the Association—one to contain pictures of the places they had visited and the other for portraits of prominent members. The interest of the two latter books would increase as the years rolled on. He spoke of the beauty of the design, and said Mr. Glover's kindness was warmly appreciated by them.

Alderman Dunn, of Gateshead, supported the motion, which was most heartily carried.

Mr. Glover, who was warmly received, thanked those present for their kind words and their applause. He referred to the members who had passed away during his time, and he concluded by giving some inspiring advice to the younger members of the Association.

The President (Mr. Frank W. Rich) then delivered his address, during which he said:—It may be interesting to glance hurriedly with an architectural eye over the past famous sixty years, and see how Newcastle-upon-Tyne comes through the ordeal. In the year of Her Majesty's accession, Newcastle would wear an entirely different aspect to Newcastle of the present day. The boundaries of the town at that time might roughly be taken to extend on the west to the west end of Thornton Street; on the north to Leazes Terrace; on the east to Ellison Place, and on the south to the Tyne. The growth of the city is not due to architecture, but to the great commercial spirit that is now upon us. There are two broad circumstances which may account for this prosperity. (1) The district is celebrated for its great mineral wealth; (2) the birth of the railway system. This latter circumstance is most intimately associated with this district, and here we have the starting-point of my remarks. Newcastle, a little previous to the time we start (1837), was but a moderate sort of place, sleepy in a way, something like the keels that used to glide down the Tyne at high tide with their heaped-up cargoes of coals as compared with the present craft. There was the castle, the older churches, All Saints and St. Thomas; the assembly rooms. And a quaint old place it must have been, and crammed full of history. But at this anterior period to the great epoch under review there was born a man who was destined to work a transformation of the old place, one of those men of indomitable will, one of those great captains of industry for which Newcastle is so justly celebrated—I allude to Richard Grainger, sometimes called "the architect of modern Newcastle," a position to which I don't think he ever aspired, but who had the good sense to call to his aid the architects of his native town, and to imbue them with the enthusiasm of which he possessed so large a store. He must have been a bold man and a shrewd one. His plans were most ambitious and gigantic, and his architects responded to the call, as, indeed, all men of art have done at all times when not beset with hampering circumstances. Grainger was well on with some of his schemes at the time of Her Majesty's accession, and the making of the great railways may be said to be synchronised with this. After these preliminary remarks we may now look at some of the architecture of modern Newcastle, of that coming within the famous sixty years, and see what account our friends living or dead can give of themselves. As a means of better realising what I am about to say, we may imagine ourselves arriving by train at our Central Station. Here, we are at once confronted by a famous building, the work of our first president, a building designed in the very beginning of the railway system, when no one could foretell its gigantic growth, yet to-day this building is as useful as the day it was built, when other stations in Britain have become obsolete and swept away to give place to modern structures. Coming out into Neville Street we obtain a fine view of the station, a building, from the clock tower to the west end, full of dignity. It is a matter of regret to us all that the original majestic design for the portico (which now hangs in the vestibule of the Museum of Natural History) was not carried out instead of the existing portico, and an equal matter of regret that the eastern extension of the station should not have been carried out on the lines of the original design, instead of the sort of coal dépôt roof lately erected. For these matters the directors must be blamed, and ought to be heartily ashamed of themselves. I make these remarks because I believe it echoes the view of all architects, and also in defence of the able man who designed the original building. The view from this spot as a "townscape" is somewhat unique. In looking to the east we bring in the view Collingwood Street and Mosley Street up to the Arcade, and in which the famous tower and spire of the cathedral group well. Looking in a

more northerly direction a similar view is obtained of Grainger Street, with the domes of the Exchange, and equally admirable monument to Earl Grey, closing the vista. We may now walk down Neville Street, and in doing so one cannot forget the change that has been effected in so short a time. One can remember Neville Street so well before Grainger Street was cut through when all the buildings round about were old-time buildings, and now nearly every one of them are new. The street, as we all know, is a very spacious one, broadening out very considerably at the Monument to George Stephenson, and with the modern buildings, now erected here, forms as fine an entrance to a city as will be difficult to beat. The entrance into London from King's Cross is shabby compared to it, as is the case in many of our principal cities. The buildings from the Douglas Hotel to the offices of the Standard Insurance Company are all modern business premises, save one, and on the other side of the street is the very large hotel lately erected by the North-Eastern Railway Company. The Union Club faces us as we proceed, forming a fine group with the offices of the *Newcastle Chronicle*, Messrs. Emleys and the offices of the Union Insurance Company. The mention of the offices of the *Chronicle* reminds me of my younger office days, about thirty years ago, when this building was designed by my old master—Mr. Parnell, a member of our Association. Before that time it was the town house of Dixon Dixon, of Unthank. To the south, where once stood the picturesque old Westmorland House, we have the offices of the Coal Trade, a very fine design by our ex-president. We now enter Collingwood Street, which, when I knew it first, was entirely residential. It is now something like the City of London, bereft of residents. The building that arrests our attention is the very fine bank, lately erected by Messrs. Hodgkin & Co. It is a stately and thoroughly gentlemanly building, and reflects the greatest credit on a lamented colleague (Mr. Robert Johnson), and the liberal-minded directors who allowed him "rope." A very fine block opposite—the offices of the Northern Assurance Company—is by the same artist. I must not forget a small building to the east of the bank, which was designed by Mr. Parnell, and was the first break into the residential quality of this street, and for many years stood high above the rest of the buildings. We now come to St. Nicholas Square. On the one hand we have the Town Hall Buildings, stretching from the square up into the Bigg Market, occupying the site of some very quaint old houses, which I remember very well, and on the other the street called the High Level Approach, a very extensive range, the High Level buildings (the work of Mr. Parnell), and opposite a picturesque block of offices by a past president (Mr. John Johnstone). Coming into Mosley Street, and proceeding half-way, we come to a famous corner, one that would be difficult to equal in any provincial city. At this particular spot, the meeting of Mosley Street, Dean Street and Grey Street, there is food for contemplation, as each corner presents something worth seeing. At one the National and Provincial Bank, by the late John Gibson; another the new building of the Prudential Assurance Company, by Mr. Waterhouse; and at the corners of Grey Street we have the start of what we call the Grainger buildings. At the head of Mosley Street stands the Arcade, one of Grainger's ambitious projects, and a stately termination to the street. Passing down Dean Street, and under the very fine arch which carries the North-Eastern Railway—a credit to engineers—one wonders why they did not carry the railway on one of the terrible utilitarian structures they delight in, floating like a spider's web, and proportionately ephemeral, but this is a good honest arch. Passing under this, one sees on all sides new buildings by colleagues yet amongst us, and many by others gone to their long home. At the angle of the Sandhill stand the very fine offices of the Royal Insurance Company, designed by Parnell, and further on the huge commercial buildings of Lombard Street, Queen Street, King Street, the Sandhill, &c. While we are at the riverside we might from the Quay look for a moment at the High Level Bridge, one of the most architectural engineering bridges in the country. Its design may be obsolete, but it far and away excels the terrible wrought-iron bridge a few hundred yards further west, which may be said to be entirely devoid of the faintest æsthetic design, and is an insult to our time. Coming back to the foot of Grey Street, we now undertake by far the greater portion of our task, for we now start with the noble buildings of Grainger and his architects. We must content ourselves with a very cursory glance. Taken altogether, they form one of the most extraordinary instances of town building ever conceived and carried out by one man. Within a year or two, they all practically fall within our period. The buildings in Grey Street, Shakespeare Street, Market Street, Hood Street, Grainger Street, Nelson Street, Nun Street and Clayton Street yield a quantity and quality that should satisfy the most exacting. As I said before, Grainger had the good sense to be guided by experienced architects, hence we have the buildings well designed, which means that detail and grouping are useful. There are, especially in Grey Street, buildings of the finest Renaissance design, where students

will find a wealth of material, and it must not be forgotten all these buildings are of a genuine stone, not stuccoed and painted, and when newly built, clean as they came from the hands of the mason and seen in a brilliant sunshine, they would indeed resemble a veritable palace of architecture—a rebuilding of Rome. To describe them all is out of the question, but we may just glance again at Grey Street, and the best view is to be obtained at the junction with Mosley Street. Here the full and graceful proportions of the whole are taken in, but not quite at one view, a circumstance which adds to the charm, for Grey Street not only ascends with a gentle gradient, but bends proudly away to the right with a noble sweep, passing on the way the Bank of England, the Theatre Royal, the group of the Exchange with its finely designed domes, Lambtons' Bank and terminating with the monumental column in memory of Earl Grey. They are familiar to us, but possibly like the prophet in his own country not sufficiently appreciated. So subtle is the design of this street that, while rising and curving, no harsh or abrupt treatment can be observed, each building though separately designed falls into one harmonious group. We may now leave this mass of modern buildings, and may safely say they stand a lasting monument to the genius of Richard Grainger and his architects, Dobson, Green, Wardle and Walker. Grainger Street West has not yet been mentioned. It is a comparatively new street, built since Grainger's days, and entirely by individual owners, the buildings being designed in every case by local architects, the result being a great diversity of design from the tail end of the Gothic revival down to date. I might also mention the new offices of the Water Company and of the Gas Company. My list, I am afraid, is but half complete, but I think I have enumerated enough to show the enormous mass of commercial buildings that have been erected here in this period, from the designs of our colleagues. I will now run over a few of the buildings that cannot be said to be commercial—the College of Medicine by our friends Messrs. Dunn & Hanson, the College of Science by the late R. J. Johnson, with whom I had the pleasure of being associated; the Museum of Natural History, St. Stephen's Church, St. Aidan's, St. Michael's, St. Matthew's, St. Peter's, St. Mary's, Rye Hill, St. Dominic's, St. James's, the Roman Catholic Cathedral by Pugin, with the tower and spire so ably added by our ex-president. This short list, taken at random, could be multiplied many times. I have not even said a word about the works and factories that abound with us, and in which architecture is often called to aid, and possibly this address would be incomplete were I not to mention that enormous hive of industry, the Elswick Works, where I have had the honour and privilege of carrying out some of the finest shops in the world. I have been in many of the chief cities of England and Scotland, from time to time, and looked about me, and often with a view of finding anything better in this respect than we have in Newcastle, but have been unable to find any. Newcastle will hold its own either in its architecture or in its administration of cleanliness. In speaking of the continued commercial prosperity, one often notices how in a busy practice commercial men often mould the ways of architecture. The imperative demands of trade are often antagonistic to the precedents in architecture. For instance, take a familiar case. The shop windows of our city, or any city, show the busy man will insist on having his window in one square of glass, or because he cannot get any glass large enough, he will divide them by gossamer bars. I am quite sure his goods would be as well seen if shrouded in architectural encasements. It would seem also in walking through our streets that the architecture will presently be "behind the scenes"—in other words it will be covered by huge letters of the alphabet. What is the cause of this trumpeting from the house fronts? Have we all become short-sighted that we cannot see to read a man's name in modern letters? I once lost a good client for declining (politely, I hope) to carry out some letters of this nature, over 9 feet high. It has often been said that an architect without the men of the building trades would be like a commander-in-chief without soldiers. The men of the building trade are our soldiers, and the excellence of their workmanship is of vital importance to us, and we cannot help but notice the nearly total extinction of some trades—that is to say, as independent trades, which are the only means in which to bring up apprentices. I am one of those men who believe that the best technical school is the workshop, where a lad would be in actual touch with the minutiae of the trade by which he will hereafter earn his living. There is at present too much of the former and too little of the latter. The apprenticeship system is self-acting and costs nothing, and I am sure the results to architects would be a comfort.

Mr. A. M. Dunn proposed a vote of thanks to the President. He said Grainger never received half the credit he deserved for making Newcastle what it was, adding that the results must have been disappointing to him financially. As the result of a Chancery case he learnt that the Grainger property was proved to be of a value of one to two millions of money. When Grainger left Newcastle, he left it one of the finest cities in the

world. Regent Street, London, could not compare with Grey Street, Newcastle. There should be a monument put up to Grainger's memory in one of the principal thoroughfares of the town.

The Great City Fire.

SIR,—The lesson of the great fire in London on the 10th inst. is this—that the proprietors of large buildings, such as warehouses and factories, especially those situated in crowded thoroughfares, should provide their own fire appliances. This fire broke out in the middle of the day, when the members of the staff were as a rule in attendance at the various warehouses, and doubtless had the necessary fire-extinguishing appliances been available at the establishment in which the outbreak occurred it would have been extinguished at once, and nothing whatever would have been heard of it except an incidental reference in the Fire Brigade report. This, however, could not be done, and the enormous traffic in the narrow streets made a rapid attendance of the public Fire Brigade a matter of absolute impossibility.

A fire in the middle of the night is apparently less dangerous than one in the middle of the day at this part of London. The public Fire Brigade has a right to expect that the owners and occupiers of large business premises will assist it to the extent of providing such simple apparatus as will be sufficient to cope with a fire discovered in its early stages.—Yours faithfully,

MERRYWEATHER & SONS, LIM.
Greenwich, S.E.: Nov. 24, 1897.

GENERAL.

A Meeting of the Institute of Painters in Oil-Colours, Piccadilly, was held on Wednesday, when the following artists were elected:—Honorary members—Messrs. L. Alma-Tadema, R.A., and John S. Sargent, R.A. Members—Messrs. E. Matthew Hale, Dudley Hardy, Gabriel Nicolet, G. C. Hindley, A. D. Reid, A.R.S.A., and R. G. Somerset.

The Late William Morris's "Kelmscott Press," which was established in order to revive printing of the old style, is about to be closed. The type will remain in the hands of the trustees for future use, but all the special ornaments will be discontinued, and the wood blocks deposited in the British Museum.

Mr. John Aldam Heaton, who was largely employed as a designer and decorator in London, died at Hampstead on Saturday. He was the author of "Furniture and Decoration in England during the Eighteenth Century."

M. Boldini, the French painter, has departed for New York, where he proposes to remain three months in painting portraits.

A New Station for the Great Northern Railway at Peterborough is contemplated, the cost of which would be about 50,000*l.* A large sum is also to be expended in improving the Great Eastern station.

The Recent Competition for public baths and wash-houses for the parish of St. Matthew, Bethnal Green, has been decided, the author of the design "Savon" (Mr. R. S. Ayling, A.R.I.B.A., of Parliament Mansions, Victoria Street) being awarded first premium, and "Red Cross" (Mr. E. Harnor, A.R.I.B.A., of 5 John Street, Adelphi) second.

The West Ham Corporation have instructed Mr. A. Saxon Snell, F.R.I.B.A., to prepare plans for the erection of public swimming and private baths at Plaistow, E.

The Next Meeting of the Northern Architectural Association will be held on Wednesday next, December 1, at 7.30 P.M., at the Art Gallery, Newcastle-on-Tyne. Mr. John Lane, of York, will deliver a lecture on "The English Cathedrals," with limelight illustrations.

St. Bride Church, Rosevale Street, Partick, the first building erected by Rev. Dr. John Macleod and the kirk-session of Govan parish in connection with the recently inaugurated scheme for church extension throughout the parish of Govan, was dedicated on Saturday afternoon. The church, which has been designed by Mr. Macgregor Chalmers, the architect for the extension scheme, is one of the most beautiful in its interior arrangements of those which have been erected in Scotland in recent years.

The Insurance Companies affected by the recent fire, who are associated in the loss on the bulk of the buildings destroyed, have entrusted the adjustment of the claims against them to Mr. Robert Willey, F.R.I.B.A., surveyor to the Hand-in-Hand Insurance Company, of 33 New Bridge Street, Blackfriars, E.C., and Mr. J. R. Cooper, F.S.I., the senior partner of the firm of Ventom, Bull & Cooper, surveyors, 35 Old Jewry, E.C.

The Architect.

THE WEEK.

THE difference between a drain and a sewer has at last been determined by the House of Lords. The case originated in an application by the London School Board for a mandamus to compel the Vestry of St. Matthew's, Bethnal Green, to repair a pipe which drained several houses. Apparently no order relating to the construction of the drain was to be discovered. The School Board maintained it was a sewer and should be repaired by the Vestry, while the contention on the other side was that the pipe was a drain, for which the School Board as owners of the houses were responsible. The Divisional Court held that although no order for its construction was forthcoming the pipe was a sewer and the vestry of St. Matthew's were bound to repair it. The Court of Appeal affirmed the decision. The Vestry accordingly appealed. The Lord Chancellor said it was clear, apart from statutory definitions, that this was what everybody would understand to be a sewer. He had not the smallest doubt that the officers of the Vestry perfectly well knew what was being done. It was not a small operation—the highway must have been taken up, and the local authorities must have been fully aware of the purpose and effect of the work. If, then this was a sewer, it was impossible to avoid the application of the language of the Act of Parliament or the conclusion that the sewer was vested in the Vestry and must be repaired by them. A combined system of drains might be constructed under an order of the Vestry by a private person. In such a case the combination would still be a drain and not a sewer, but there was no evidence of such a state of things. It was clear that those who alleged that this was a drain and not a sewer must prove that such an order of the Vestry was made, but no such order was produced, and he did not believe that any order of the kind was made. He came to the conclusion that the judgment of the Court of Appeal was right and must be affirmed. As the other noble and learned lords concurred the appeal was dismissed, with costs. The effect of the judgment must be an increase of the liabilities of the vestries in the Metropolis and of the sanitary authorities in other places.

THE project for the Glasgow International Exhibition of 1901 has emerged from the nebulous condition of its first stage. The guarantee fund amounts to 290,696*l*. Several applications for the offices of secretary and general manager have been received. An executive council has been formed and has held a meeting. HER MAJESTY has promised, if all is well, to be patron, and although the Prince of WALES is unable to accept the office of honorary president, His Royal Highness has offered to become vice-patron. The preliminary arrangements are therefore sufficiently satisfactory to warrant a belief in the success of the exhibition.

ON November 4, 1804, half a dozen artists met at the house of SAMUEL SHELLEY, the miniature painter in George Street, Hanover Square, in order to ascertain if a society of painters in water-colours could be founded. In addition to SHELLEY were present HILLS, WELLS, VARLEY, GLOVER and PYNE. It was decided to try the experiment of holding an annual exhibition of water-colour drawings which were to be produced by the members. The first exhibition was opened on April 22, 1805, at the "Great Room" in Lower Brook Street, Grosvenor Square, to which sixteen members contributed. There were 275 drawings, and the exhibition was visited by 12,000 people. W. S. GILPIN was the first president; he resigned in 1806. Next year he was succeeded by GLOVER, and then by REINAGLE. In 1812 there was a split, and it was resolved "That this Society, having found it impracticable to form another exhibition of water-colour paintings only, do consider itself dissolved this night." An effort was made to reconstitute it as a Society of Painters in Oil and Water Colours, but in 1821 paintings in oil were excluded. The first President of the reconstituted Society was CRISTALL. On his death in 1832 he was succeeded by COPLEY FIELDING, and then

came J. F. LEWIS, F. TAYLER and Sir JOHN GILBERT. On Tuesday night the election of Mr. E. A. WATERLOW, A.R.A., as president took place. The competition lay between him and Mr. HERKOMER, R.A., and the victory was won by a single vote. Mr. WATERLOW, like his predecessor, is also a painter in oils. But the majority of his works might be said to be inspired by the spirit which prevails in Pall Mall East.

THE annual meeting of the Society of Antiquaries of Scotland was held in Edinburgh on Tuesday. The following office-bearers for the ensuing year were elected:—President, the Marquis of LOTHIAN; vice-presidents, J. BALFOUR PAUL, Lyon King-of-Arms; Major-General Sir R. MURDOCH SMITH and the Hon. JOHN ABERCROMBY; secretaries, DAVID CHRISTISON, M.D., and ROBERT MUNRO, M.D.; foreign secretaries, Sir ARTHUR MITCHELL, K.C.B., M.D., LL.D., and THOMAS GRAVES LAW; treasurer, J. H. CUNNINGHAM; curators, ROBERT CARFRAE and Professor DUNS, D.D.; curator of coins, ADAM B. RICHARDSON; librarian, JAMES CURLE; councillors, Sir GEORGE REID, P.R.S.A., and JOHN RITCHIE FINDLAY, representing the Board of Trustees; CHARLES J. GUTHRIE, THOMAS ROSS, GILBERT GOUDIE, REGINALD MACLEOD, C.B.; Sir HERBERT MAXWELL, Bart., M.P.; JOHN HOME STEVENSON, and ALEXANDER J. S. BROOK. According to the annual report the museum had been visited by 22,310 persons during the year, and the number of objects of antiquity added to the collection had been 135 by donation and 370 by purchase; while seventy-seven volumes of books have been added to the library by donation and 102 by purchase, and the binding of 150 volumes has been proceeded with. Among the more important donations to the museum is the series of articles discovered during the excavation of the Roman camp at Ardoch, undertaken by the Society last summer, which have been presented by Colonel HOME DRUMMOND, of Blair Drummond, the proprietor.

THE School Board of London on November 8, 1894, accepted the tender of Messrs. KIRK & RANDALL, amounting to 31,324*l*., for erecting new stores for books, apparatus and furniture in Clerkenwell Close. In connection with the adjustment of the accounts for this work, the committee received a letter from these contractors stating that the very numerous alterations made as the work progressed, necessitated by the requirements of the district surveyor and parish authorities, and the delay which followed, entailed considerable extra expense, and will result in a loss to them. They forwarded a detailed statement of claim for additional payment, amounting in all to 2,750*l*. 19*s*. 5*d*., and offered to refer the matter to some disinterested and qualified professional man. Messrs. KIRK & RANDALL have since notified the Board that they are willing to accept half the amount of their claim, viz. 1,375*l*., rather than refer the matter to arbitration under the conditions of the contract. Having regard to the special circumstances of the case, and to the fact that if the matter were referred to arbitration the Board might, with the sum awarded and the costs of the arbitration, be held liable for a still further payment, the works committee are of opinion that the proposed settlement should be agreed to.

THE work of the city engineer of Liverpool is of a most onerous nature, and it has been efficiently carried out by Mr. BOULNOIS. But it does not follow that his successor will be equal to the duties. Accordingly it was arranged that the examination of plans and other routine work in connection should be undertaken by a building surveyor. Apparently on the assumption that the office of engineer would henceforth be a light burden for the holder, the health committee of the City Council fixed the salary at 1,000*l*. a year. That sum is inadequate for the services of a competent engineer, and accordingly on Wednesday Sir A. FORWOOD moved that the sum should be 1,500*l*. But the proposal was defeated, as well as another which fixed the salary at 1,200*l*. The committee will seek for candidates by advertisement, and they say they are determined to appoint the best man that is to be obtained. What they mean, no doubt, is the best man obtainable for so moderate a salary.

THE MYSTERY OF PROPORTION.*

THE expositor of "The Canon," for we suppose we dare not consider any modern man or woman as the author of such ancient speculations, has either from modesty, fear or reverence concealed his name. Indeed, it may be doubted whether the speculations which fill the pages were ever considered as less than heretical, and in many a pagan city whoever uttered them would be as likely to meet with punishment as he would certainly be in a Mediæval city when ecclesiastics controlled the law. From its danger the subject was always fascinating, and the science of the nineteenth century cannot prevent an expositor from devoting his life to it, and a publisher would not put his name on the title-page unless there was a likelihood that many purchasers were to be tempted by the announcement of "An Exposition of the Pagan Mystery perpetuated in the Caballa as the Rule of all the Arts," and as an enthusiast would add, "of all the sciences too."

But those who have patiently endeavoured to meditate on the mystery will at first be induced to doubt the competence of the expositor for what he has undertaken. For he has gone for a character of himself and, what is infinitely more unworthy, for an appreciation of the mystery to so erratic a being as Mr. CUNINGHAME GRAHAM. That gentleman displays his incompetence to comprehend the rudiments of so abstruse a philosophy by allowing such nonsense as the following to escape from his pen:—

If, in his researches, the author has brought to light some canon which may enlighten architects, and so redeem us from the outrages our builders heap upon us, if he can do even a little to stay the hands of Deans and Chapters from destroying buildings which, by the folly of the nation, have been committed to their care (like sheep to wolves), or put a stop to the restorer, that arch fiend who, in consuming thirst for unity, tears down a fine Renaissance doorway in a Gothic church and puts up instead what he thinks Gothic, his labour will not have been lost. Could he redeem us from Victorian Queen Anne, but mitigate the horrors of plate-glass, set bounds to all the Gothics ranging from Strangled through the degrees of Congregational and Convulsional down to Ebenezersque, could he but find a style in which our builders could express their thoughts and help them to build for us our churches, houses, theatres and bridges without adhering slavishly to bygone styles, the twelve shillings which I understand his volume is to cost will be well spent. Music and literature, with painting, surgery and economics, with boxing, fencing and others of the liberal arts, all have a style fit and peculiar to the times, but architecture yet remains a blot and a disgrace to those who live by it, and to all those who use the edifices which it makes and pay the makers' bills.

A man who raves must excite pity in those who hear him, but what is to be said of an expositor who accepts the words, however incoherent they are, as a guide to the meaning of his own work? "The Canon," as expounded in the pages, has nothing to do with plate-glass windows or the relative propriety of Renaissance and Gothic doorways, and to suggest, as is done by retaining the preface, that the pages deal with details of the kind comes perilously near an endeavour to obtain money by false pretences. The purchasers of the book will do well to tear out the preface and judge the exposition without the help of Mr. CUNINGHAME GRAHAM's interpretation.

What the expositor attempts is to explain the ancient, the esoteric doctrine of numbers. It is sometimes associated with the name of PYTHAGORAS, but he derived it from still older teachers, and there can be no certainty about when or where it originated. MACAULAY fairly suggests what was thought of it in the Academy when he describes PLATO as saying that the science of number "habituates the mind to the contemplation of pure truth, and raises it above the material universe, and that it would help to teach disciples to withdraw their minds from the ever-shifting spectacle of this visible and tangible world, and to fix them on the inimitable essence of things." MACAULAY's own opinion of the value of numbers differed from that of PLATO, but on that subject we need not enter.

The value of numbers was to an ancient mystic recalled by names as well as in other ways. Mr. RUSKIN is a modern mystic, and as such it was only natural for him to endeavour to discover occult meanings in the names he

found in SHAKESPEARE'S plays and elsewhere. His efforts seemed ridiculous to modern philistines, the late MATTHEW ARNOLD being one, who had not walked in the byways of ancient philosophies. To the Greeks, however, names, and especially proper names, were interesting because there was a numerical value attached to the letters composing them, and in that way many remarkable coincidences were discoverable. In "The Canon" examples of what is possible to be made out are to be found in many of the pages. There is no doubt the practice was sometimes abused, and SOCRATES was referring to such cases when he said:—"I believe that the primeval givers of names were undoubtedly like too many of our modern philosophers, who in the search after the nature of things are always getting dizzy from constantly going round and round, and then they imagine that the world is going round and round and moving in all directions, and this appearance, which arises out of their own internal condition, they suppose to be a reality of nature; they think there is nothing stable or permanent, but only flux and motion and that the world is always full of every sort of motions and change."

What can be done by the combination of letters and figures has been shown by the late Professor DE MORGAN in his "Budget of Paradoxes." For example, PETER BUNGUS shows very easily how the mystical number 666 is applicable to MARTIN LUTHER. If from A to I represent 1-10, from K to S 10-90, and from T to Z 100-500; we see—

M A R T I N L U T E R A

30 1 80 100 9 40 20 200 100 5 80 1

NAPOLEON III. and other modern notabilities have been subjected to the process with similar success, and it is a favourite mode of arguing against the Roman Church. A more amusing case is the following. Some years ago the Royal Society proposed to restrict the admissions of men of science to fifteen in each year, while noblemen could get into the Society *ad libitum*. According to the late Professor DE MORGAN, one of the members of the Council, a Mr. GALLOWAY, opposed the proposal, and inquired why fifteen, of all numbers, was fixed upon as the normal rate of increase:—

Was it, he demanded, because fifteen is seven and eight, typifying the Old Testament Sabbath and the New Testament day of the resurrection following? Was it because Paul strove fifteen days against Peter, proving that he was a doctor both of the Old and New Testament? Was it because the prophet Hosea bought a lady for fifteen pieces of silver? Was it because, according to Micah, seven shepherds and eight chiefs should waste the Assyrians? Was it because Ecclesiastes commands equal reverence to be given to both Testaments—such was the interpretation—in the words, "Give a portion to seven, and also to eight?" Was it because the waters of the Deluge rose fifteen cubits above the mountains? or because they lasted fifteen decades of days? Was it because Ezekiel's temple had fifteen steps? Was it because Jacob's ladder has been supposed to have had fifteen steps? Was it because fifteen years were added to the life of Hezekiah? Was it because the feast of unleavened bread was on the fifteenth day of the month? Was it because the scene of the Ascension was fifteen stadia from Jerusalem? Was it because the stone-masons and porters employed in Solomon's Temple amounted to fifteen myriads? &c., &c.

We have not space to follow out the connection between numbers and words, although it is an entertaining pursuit. When numbers and form are united, as in geometrical figures, the subject comes nearer to us, for it is a sort of basis to architectural proportion. In that most prosaic of books, CRESY'S "Encyclopædia of Civil Engineering," there is a chapter on principles of proportion which has been transferred to "Gwilt." CRESY covered and enclosed ancient and modern buildings with squares, triangles, circles, &c., and, as he believed, fixed the system once and for ever. He has had many later rivals, and apparently speculations of the kind are as old as systematic building. VITRUVIUS had a notion of the importance of the human figure as a standard of proportion for architects' work, but the mystics, including the expositor, carry the proportions far beyond temples or buildings made by hands. In "The Canon" we read:—

The architect Cesariano, who edited an Italian translation of Vitruvius published in 1521, has drawn the two figures, intended by Vitruvius to embody the proportions of temples

* The Canon: An Exposition of the Pagan Mystery perpetuated in the Caballa as the Rule of all the Arts. London: Elkin Mathews.

with an anatomical exactness not to be found elsewhere. The first glance at these two figures shows us that they are each disposed in the form of a cross. The man whose body forms the Jerusalem cross is relatively bigger than the other, whose limbs describe the St. Andrew's cross or saltire, their proportions being so arranged as to exemplify the duplication of the square. The square enclosing the greater man is divided horizontally and vertically into thirty parts, thus dividing the area into 900 small squares. His height being 96 digits, the perimeter of the square is 384 digits—the number of the soul of the world according to Plutarch—and if he were drawn into the Holy Oblation, then his body would extend through the seven orbits of the planets to the sphere of the Zodiac or fixed stars, and exactly resemble the figures of the Macrocosm which appear in the works of the mystic philosophers of the seventeenth century. The figure of the lesser man would occupy the square whose area is half that of the Holy Oblation. Now the Microcosm, whose body is disposed saltire-wise, like the letter X, exactly agrees with the description of Plato's Logos, whom the early Fathers considered to be identical with the Christos. And when the Microcosm, or Logos, is stretched crosswise in a circle, drawn within the Holy Oblation, the sides of the square surrounding his body measure 1,480 diameters of the sun, and the name Christos is numerically equal to 1,480.

All these conclusions may be included among the "delicias et fastum mathematicorum," but able men were for many a century occupied with them. Mathematical recreations of the sort "do remedy and cure many defects in the wit and faculties intellectual," to use Lord BACON's words; and by them men were enabled to take an interest in things which otherwise might be neglected. The expositor sets great value on the diagrams of Milan Cathedral, which are also given by CESARIANO. That building presents remarkable coincidences in its proportions, as indeed do many of the Gothic churches. But in "The Canon" there is little difference between Pagan and Christian churches, for it is believed that all great buildings were set out according to a common system of proportion. Hence it is said that "in the Parthenon we probably see the prototype of the arrangements of the Christian church, and also there is no doubt that SOLOMON'S Temple formed the pattern of the Christian church, and the ark occupied the centre of the holy of holies."

The mysticism that was exhibited in Gothic churches is explained by DURANDUS, and has formed an inexhaustible topic for modern investigators. From what is said by SPENSER in the "Faerie Queene," it would appear as if the fine gentlemen of the Court were acquainted with the subject. Thus, when ARTHUR and GUYON are introduced by the Lady ALMA into her castle, which is built of a material resembling Egyptian slime, like that used in the Tower of Babel, the building is thus described:—

The frame thereof seemed partly circular,
And part triangular: O work divine!
Those two the first and last proportions are;
The one imperfect, mortal, feminine;
The other immortal, perfect, masculine;
And 'twixt them both a quadrate was the base,
Proportioned equally by seven and nine;
Nine was the circle set in heaven's place,
All which, compacted, made a goodly diapase.

The lines have a meaning which is not clear to us, but they were plain to the poet's contemporaries. Afterwards those peculiar proportions were neglected, or they took the form we find in Sir HENRY WOTTON'S book. A little later a more general system was in favour. HARRINGTON, the author of "Oceana," suggested to NEWTON that the proportions in architecture coincided with harmonic ratios in sound. The reply of the great mathematician is remarkable. "I am inclined to believe some general laws of the CREATOR prevailed with respect to the agreeable or displeasing affections of all our senses; at least, the supposition does not derogate from the wisdom or power of God, and seems highly consonant to the simplicity of the Microcosm in general." If NEWTON had attempted to define those general laws aesthetics would now be a different sort of science.

As might be expected from his speculations, the expositor believes that remains of ancient philosophical doctrines of architectural proportions may be found in the ritual of the Freemasons. LAMECH is supposed to be the father of masonry, a name with a numerical value of 676, the square of 26, and 26, according to the expositor, is the number of Tetragrammaton, which, with the alphabet of

26 letters and the Sephiroth, are the foundation of all things. The value of the word masqny is also 676, and much else might be added.

The three Classic orders—Doric, Ionic and Corinthian—are said to show a mystical purpose, for "they apparently symbolise the Macrocosm, the Microcosm and the Bride or Virgin of the Caballa, the three personifications of the architectural canon." When we remember that architectural forms can be discussed in police-courts and are to some extent controlled by county and parish authorities, there is some relief in learning that the art was and can become an inexhaustible subject for the contemplation of mystics. For is it not gratifying to be assured that the proportions of the solar system or the harmony of the spheres "probably formed the harmonic canon of the architects, and it may be concluded they were known to VITRUVIUS"?

The value of "The Canon" arises from being a sort of record of the efforts which were made during ages to discover why buildings were impressive? At the present day it is not easy to answer so complex a question. The ancients endeavoured to solve the difficulty by a comparison of the proportions of various buildings, then taking one as a standard and fixing the relations of the parts with the aid of numbers. The dignity of architecture was further enhanced when it was found that what was true of a building was often applicable to the universe as a whole. If an apple could suggest the law of gravitation to a NEWTON, it was not surprising that ancient geometricians could find conformity between buildings and the Kosmos. "The Canon" is interesting because it suggests that building is not altogether to be judged by utilitarian laws, and has sublimities which are worth the attention of the theologian as well as of the architect.

ACCUMULATOR TRACTION ON RAILS AND ORDINARY ROADS.

IN connection with the articles which have appeared in this Journal on the subject of electric traction, it will be of interest to briefly notice a paper read on November 11 before the Institution of Electrical Engineers by Mr. L. EPSTEIN, M.I.E.E., who is a well-known expert and inventor.

Electric traction by means of accumulators, states Mr. EPSTEIN, "could, until quite recently, only be pronounced a failure, and all that even its most ardent advocates can plead for it is the substitution of the term 'qualified success.'" This is quite true, and in contrast to this the author places the "unqualified success" of the trolley system. Mr. EPSTEIN mentions, however, that the matter is now on a sounder basis, owing to the progress in the manufacture and experience gained in the use of secondary batteries. The reasons for this failure are stated to be covered by (1) inherent defects in the accumulators themselves, and (2) mistakes in their mode of application.

The author very rightly states that the accumulators should be employed in such a manner that they require a minimum of attendance, and points out that in the unsuccessful tramways this has not been done. "The common practice was to subdivide the battery into a number of groups, each contained in a tray, and the connection between one tray and the next, as well as at the terminals, both in the cars and in the lifts for charging, was most imperfect. Sliding contacts were generally used, which were open to attack by the acid spray. . . . Again, the pulling out and pushing in of these heavy trays was not always done with the requisite care, much to the detriment of the batteries, cars and lifts." The electrical leakage when charging, owing to the cells being saturated with acid spray, is mentioned as another fault.

Mr. EPSTEIN advocates the use of batteries treated as one permanent whole, "either by being placed in the cars or preferably slung to the frame, or carried on a separate car. When the conditions of working render it desirable the motor or motors could also be fixed in the battery car, which would then assume the character of an electric locomotive. The obvious advantages gained by this method are the absence of lifts or similar contrivances, good connection between cell and cell, no corroding contacts, no loss of current through leakage, less wear and tear of batteries and consequently easier management and reduced expenses."

The author then goes on to say that the Hanover and Paris examples show how this object has been attained. As the methods and results obtained in these two places were given fully in this Journal a few weeks ago, we will not repeat them here. With respect to Hanover, the disadvantage mentioned is that the battery has to be carried along the trolley portion, and its dead weight reduces the efficiency. A suggestion is made that the battery might be picked up (if slung under the car) at the end of the trolley section, and the charging of the accumulators could still go on from the trolley wire, but at fixed points instead of *en route*.

A great many figures are given as to the cost of accumulator working with the cells in a "dummy" car or bogey, and these are advocated for places where the traffic varies considerably, as they can be attached to any car and fewer cars than dummies can be kept, thus leaving time for charging.

The accumulator itself is then considered, and the following requirements are stated:—"Although lightness may not be the main consideration, yet it is a very important one. Again, the cell must not only be able to withstand jolting, without shedding of material, and high discharge rates without buckling, but, moreover, it must not decrease in capacity while in use, as this would necessitate alterations in the time-table relating to the charging of the batteries, and interfere with the general arrangement. The battery, furthermore, should not require frequent overhauling, and the repairs should be neither more numerous, nor more costly than those of any other part of the machinery." However, great improvements will have to be made before these conditions, especially the last, are complied with.

The author thinks that "The nearest approach to this ideal cell will probably be one of the Planté type, with a large extent of surface, the layer of active material relatively thin, but in most intimate contact with the metallic lead out of which it has been formed." In fact, Mr. EPSTEIN really goes on to describe the Tudor cell as used on the Paris tramways. This is a rather interesting result when it is remembered that Mr. EPSTEIN is the inventor of and was lately a maker of batteries on a different principle which were introduced for electric traction, but we think have since been abandoned.

A very interesting point is mentioned which is very little known—that is, the voltage of a battery falls very rapidly after the negative plates are exhausted, but that with the positive plate slowly. It is, therefore, advisable for traction purposes to use negative sections of higher capacity than that of the corresponding positive sections.

Overcharging is recommended in moderation as being useful, not in improving the electrodes, but for mixing the acid by the evolution of gas.

The question of depreciation on accumulators is gone into and a figure is fixed as the highest which should be allowed. This comes out at 35*d.* per car mile for 400 volts—240 amp. hours. This is stated to be greater than that at Hanover, but it is explained that at this place the battery seems too large. It is also, it will be remembered, a fact that the cost of accumulator traction is only slightly in excess at Hanover of the cost of trolley traction.

The latter part of the paper deals with electric motor cars, but there is not a great deal which is new in this. However, it is shown that if a battery has to have new plates even in eight months, the cost would only be 5*d.* per cab-mile, and if in two years 166*d.* per mile. But the cost of frequent inspection becomes of more importance than that of actual cost of renewals. "Reliability of the battery, obviating the necessity for frequent examinations and tests and for remedying partial defects, is again of much higher importance—within reasonable limits—than the lifetime of the whole battery."

A further point is that "lightness of batteries for ordinary roads is of much more importance than it is on tram lines, not only on account of the heavier energy expenditure which is necessary to propel a given weight, but the more so as the battery will represent a larger portion of the total weight of the vehicle as compared with tramcars." It is also suggested that there should be several charging stations in various parts of the town where cabs run, so that a call could be made at the nearest station for

a fresh battery, when the one used showed signs of being exhausted.

The discussion did not bring out many points of interest, and the criticism was all favourable to Mr. EPSTEIN. Some figures were given referring to the cabs of the London Electric Cab Company, which have already been given in this Journal.

Reference was made to the Birmingham Central Tramway system by two speakers, and the failure of this experiment was explained in the same way by them as it was explained in a general way by Mr. EPSTEIN in his paper, viz. chiefly due to defective methods of charging and handling, and no doubt to imperfect accumulators.

This paper is, on the whole, no very great addition to our knowledge on the subject, but the information obtainable has been collected from many sources, including the author's large experience, and placed before us in a convenient and pleasant manner.

WAREHOUSE AND FACTORY FIRE DANGERS.

By GEORGE H. BIBBY.

THE numerous buildings destroyed by fire in the City on November 19 were almost exclusively of the warehouse class, or else factories, workshops and buildings of a kindred nature. For the most part they were constructed in conformity with the modern requirements of various Building Acts (so far as regards the provision of means for the prevention of the spread of fire from one building to another), but with less consideration as to the means to be adopted for the prevention of fire extensions from one floor to another, and to the roofs.

If a building contain more than a given number of cubic feet, or if the nature of the business to be carried on is such that it appears to demand special precautions, these are very frequently limited to the division of the premises into one or more fire-tight compartments. They are formed by vertical partitions of brickwork extending from the foundations to a point above the roof, and with double iron doors at each floor level, or where these may be required, but such doors are obviously quite as likely to be left open (upon the outbreak of fire) by the alarmed workpeople, as too frequently are the doors of "water-tight" compartments of ships upon the occasion of collisions.

Further than this, the iron doors are very frequently of insufficient thickness, do not fit the openings closely, or are excessively large and too heavy to be moved easily, or are arranged to slide on rollers subject to considerable friction. Even when the doors have been duly closed, I have found, after a fire, that flames have passed through the small openings between the jambs and doors, and that the woodwork in floors and partitions (placed too close to the iron doors) had been ignited.

One of the chief causes of the spread of fires in warehouses, factories and workshops, is that the sides and soffits of the floor joists are exposed to its action, or, if covered at all, are ceiled with light boarding, instead of lath and plaster. After a very considerable experience in factory inspections, both in the provinces and the Metropolis, I have found that most factories and workshops (where not supplied with concrete or other fire-resisting floors) have only the joists and floor boards at each level, and are entirely without ceilings of wood or plaster, or of corrugated iron plates, as can occasionally be seen in factories.

A further cause of the rapid spread of fire within a building is that in very large numbers of factories and warehouses the means of communication between the various floors are usually wooden staircases or step-ladders, boarded on their soffits, and with boarded partitions dividing them from the workrooms. These and the wood-cased lifts to be found in many buildings have been known to convey flames from basement to roof with enormous rapidity, and if, as is frequently the case, there are no fire buckets, or if these happen not to be filled with water, or if there be no convenient means of refilling them (in cases when the first bucketful is ineffectual), the building is often doomed to destruction before the firemen can arrive.

When a great fire occurs and large numbers of buildings are almost simultaneously destroyed it is highly probable that some of the workpeople may be burnt to death, and without any knowledge of the circumstance coming to the public ear or even to the owners of the premises, for it is a common occurrence for one or two of the occupants of a warehouse or factory at meal times to take his or their food in some isolated apartment or behind packing-cases, &c., and then to sleep out a portion of the dinner hour; some of these may have no friends to inquire about them if missing after a fire, and the books of the firm employing them being burnt during the conflagration, no record may remain respecting their employment upon the premises at the time.

When the plans for a new warehouse have been passed and approved by the local authority, any precautions to be adopted in the event of fire remain entirely in the discretion of the owners and occupiers, unless these should desire to insure their property, in which case the surveyors to the insurance company may require certain works to be carried out to secure the safety of the premises before advising that a policy of fire insurance may be granted.

But if the plans are submitted for a factory or workshop the case is quite different, even if there be fewer persons engaged on the premises than in a warehouse, for under the Factory Acts of 1891 and 1895 (as well as under previous Acts) such premises are never quite free from periodical inspections by the Home Office officials, the sanitary authorities in the provinces and the London County Council in the Metropolis, and where explosives are manufactured or petroleum used, special inspectors are required to survey the premises.

In the provinces generally, the inspection of factories and workshops, under the provisions of the Factory and Workshop Acts of 1891 and 1895, must necessarily, under existing circumstances, be much less effective (as regards other than Home Office inspections) than the inspections by the officials of the London County Council, who are engaged in reporting upon the condition of all factories, workshops and laundries in London having more than forty workpeople employed therein). The chief reason why such inspections would be less effective in the provinces may be because the districts, being in many cases of limited area, it is impossible or inconvenient to employ officials specially upon such duties or with the necessary qualifications for the work. In London, however, such inspections for the London County Council have been upon a large scale, and chiefly carried out by officials who have had a lengthy previous experience as to the safety of theatres and music-halls and the precautions to be observed therein in the event of fire.

To prevent or delay the spread of fire from one building to another, it is most desirable that the ceiling of the top floor should be of fire-resisting materials. In a building of many floors it may often be impracticable to construct the floors throughout with fire-resisting materials, not only for economical reasons, but for various other considerations. But the extra cost of the fireproof ceiling is a much smaller matter, and such construction might well be insisted upon in districts where the streets are narrow and the buildings are lofty and crowded together. It is obvious that if each building forming a warehouse or factory be a "fire-tight" compartment, as regards the party-walls, the greatest danger is at the roof, and it is there that the heat would be greatest. In narrow streets especially (and certainly in the case of warehouses where valuable goods are stored) there should be fixed outside iron shutters to the windows. These, I believe, were first introduced in some of the windows of warehouses previous to the last great fire in Chicago, and with satisfactory results, for I have myself seen a building there which was so provided, and which remained almost unharmed in the midst of destruction on every side.

Ceilings of concrete and other fire-resisting materials are occasionally adopted in the construction of the top storeys of hospitals, workhouses, asylums and buildings of a similar description, and where a considerable surface has to be covered, and there appears to be good reason for adopting similar precautions in the erection of business premises. The chief objection to such ceilings is that owners and occupiers are very desirous of securing upon the uppermost floor the advantages of skylights or lantern

lights in the roof for certain processes of manufacture requiring the best light obtainable.

So far as I am aware, no public authority has yet laid down any fixed regulations either as to the construction of new warehouses and factories, or as to the alteration of existing buildings of that description, having special reference to the requirements of the Factory and Workshop Acts of 1891 and 1895. It appears, in fact, almost impossible to frame anything more than general rules for the information of those concerned with such work. The most important features of these Acts are connected with the safety of the workpeople employed in each building, and then only if more than forty persons are employed.

If the buildings should be of considerable area, two or more staircases should always be provided, built of fire-resisting materials, and enclosed in brick walls of adequate thickness, and with all doors useable as exits arranged so as to open outwards, or if towards two or more exits to swing both ways and in such a manner as not to encroach upon the landings or passage-way of the staircases. Any means of escape that may be secured by way of the roofs should be fully considered, and staircases or step-ladders provided so that there may be every reasonable facility for reaching the roof. Of course, when any building is so situated that escape over the roof to other premises would be impossible (as in the case, for instance, of a building much higher than others adjoining) special means for enabling the workpeople to descend from the roof to the ground should be considered, especially in those instances where it would be impossible to use a movable fire-escape, as is the case with a large number of buildings in the narrow courts and alleys of many of the provincial cities and of the Metropolis. Many erections can only be reached by means of a covered entry of very narrow dimensions. After a very considerable experience upon the inspection and survey of warehouses, factories and workshops, I have found very few buildings of these classes provided with sufficient means of escape from the upper floors in the event of fire or panic.

There are buildings which are provided not only with very elaborate and perfect systems of hydrants and hose, &c., with fire-buckets and other appliances, but also with external iron landings and ladders communicating with every floor. The efficiency of these, however, would often be negated by their position with regard to the windows, as in the event of fire, smoke and flame from these might render the ladders impassable. Some factories are not only provided with steam fire-pumps and other special appliances, but also with well-trained private fire-brigade men, who are periodically exercised in the duties they may be called upon to perform.

A not uncommon defect to be found in factory buildings, especially those of older date, is that iron window frames (with very small panes) are provided, through which it would be impossible for the workpeople to pass should the usual exits be unavailable by reason of fire and smoke. Windows of that class are frequently without any portions arranged to open, and cases have occurred where the workpeople have been burnt to death in the presence of a crowd, unable from the outside to break the ironwork of the windows in time to rescue them.

There are buildings which are not only so constructed as to offer every facility for the rapid spread of fire, but are made yet worse by reason of the large stocks of wood stored in drying-rooms, heated by steam pipes from one year's end to another. These apartments are frequently partitioned off by mere matchboard constructions instead of brickwork, iron, or other fire-resisting materials; and it is a matter for surprise that so many of these badly-arranged buildings should have escaped destruction long since.

If erected at all, those buildings should at least never be permitted in narrow streets and closely built-up districts, but they do exist in nearly all the large towns and in the Metropolis, and we may, therefore, from time to time expect recurrences of such disasters as those that have occurred in the Aldersgate district, St. Mary Axe, Tabernacle Street and elsewhere.

Mr. R. E. Middleton will read a paper on "The Pollution of Water and its Correction" at the meeting of the Society of Engineers on Monday next.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

ON Monday evening Mr. Stephen Adam, Glasgow, lectured in the Leeds Institute on "Glass-Staining Art," with special reference to the position of the craftsman in art work. After describing the varied processes and glancing at the history of the ancient craft from the tenth to the nineteenth century, with the aid of cartoons and examples, the lecturer proceeded to say that he deplored the use of enamel or paint on glass surfaces, especially for church memorial windows intended to be permanent. He strongly advocated the pure "mosaic" methods of execution as practised in Mediaeval times. He pointed out with regret how many otherwise excellent windows carried out in "enamel style," such as those in College Chapel, Oxford, and in Glasgow Cathedral, were rapidly fading away. It might be said that there was nothing in art or nature imperishable, but certain stained-glass windows of the tenth, twelfth and thirteenth centuries in our English and continental cathedrals tell us to-day, and proclaim it in glowing "mosaic" colours—through which the light of centuries has streamed in subdued glory—that stained glass can be durable in ineffaceable beauty long after tombstone memorials have crumbled into dust. In conclusion, the lecturer contended that the aim and mission of the art craftsman in ennobling and beautifying our surroundings was higher than that of the artist who year after year wearied us by monotonous exhibits of subjects teaching nothing. On the motion of Mr. Bedford a hearty vote of thanks was awarded to Mr. Adam for his interesting paper.

"THE BROKEN CONTRACT."

POLITICIANS have taken much of the romance out of Egypt, and Mr. F. D. Clapham was wise to make timely use of an ancient tradition (or to reinvent one) for "The Broken Contract," the Egyptian Enigma which was to amuse the Architectural Association on Friday last. In a few years African as well as Egyptian mysteries will be too commonplace for a dramatist. The whole action of the Enigma takes place within or outside the tomb of King Amenemhat, of pious memory. At the opening several Egyptians, decorators by profession, are discovered looking round the walls of the tomb carefully, but there is no cranny to allow escape. Time did not count for much in Egypt, and a dramatist can afford to be liberal with it. The prisoners were walled in exactly 4,000 years ago, but they retained their voices as well as their youth, for they announced in vigorous tones why they were entombed. It was through a common fault with decorators, the neglect of time, and what was intended as a tomb was utilised as a prison. There they were left:—

For failing to complete this vault,
Although it was not all our fault.
Let our fate all builders warn
Their time limits not to scorn,
Nor extend their contract date,
Or they'll share with us our fate.

It is no excuse that their tender was the lowest, or that they had subsequently converted the business into a limited liability company with a still more limited interest in the contracts, and that a strike of decorators followed. Masters, men and handmaidens were immured, but owing to the skill of Painhesi, the court physician, and occasional slumbers during a century, the builders and decorators were kept alive, and by an accident the Princess Nephthis, the daughter of Amenemhat, involuntarily shared in the captivity. Her highness was an amateur who obtained prizes at the Thebes school of art. She was an economist also, and was therefore competent to make clothes-horses out of meat-skewers, arm-chairs out of packing-cases and art muslin. As a dutiful daughter, it was her ambition to paint the paternal tomb a brilliant grass green, which would scare the eyes of thieves. But her influence was profitable to the firm of Pempi & Merimies, for when the male decorators went on strike, the worthy pair "had a little plan," and, as they said:—

We advertised for girls, they work for much less than a man.
Of course we chose the pretty ones and gave them all smart frocks,
And took good care to see they wore the latest thing in clocks.
When working on a ladder it's a thing that always drew,
Their ankles being all well made,
They certainly increased our trade.

The princess moreover kept up the spirits of her companions by her faith in the future, for once at the Karnak races she was told by a gipsy that she was to be hidden from sight for many years, then she was to be released and was to marry her rescuer. Who could doubt such a prophecy and the hopes it inspired? The adventure was scarcely related and a song given about the tender memories of bygone days when an Architectural Association exploration party, headed by Professor Stonechat,

tumbled in through a hole in the rock. In reply to the usual questions about who they were and what they did for a living, the explorers answer:—

We students are
All on a par,
As doubtless you conjecture;
Our only aim,
To spread the fame
Of Art and Architecture.

It is needless to say the princess could not fail to fall in love with Stanley Chester, the selected one of the party. While the pair are billing and cooing in a style that is never ancient, the Egyptian firm comparé notes with the strangers about architectural affairs, but the moderns have to hide their diminished heads when they learn that once upon a time in Egypt "nothing was ever done without consulting an architect." Stanley, too, suspends love making for a time to chant about the model English architect:—

He has a wish when he leaves school
To be an Architect,
He wants to join the great A.A.,
He likes to be correct.
He sends his nomination form,
We give to him our votes,
He pays his sub., gets in return
The "Brown Book" and the "Notes."
He goes into an office where
He learns to trace and draw,
He wades right through the Orders, too,
And votes them all a bore.
He wins a travelling studentship,
The "Pugin" or the "Soane,"
He goes abroad and then he starts
An office of his own.
For he's a right good sort of chap,
A man we all respect,
The best of jolly fellows is
The budding Architect.

Although he is describing himself when he talks of the best of jolly fellows, by the laws of gipsydom and fortune-telling Master Chester has no claim on the princess, for Professor Stonechat was the first to tumble into the tomb, so the act closes with weeping and wailing, accompanied by the resolve of the chorus to make the princess and Mr. Chester happy.

As it is necessary in affairs of the kind to have recourse to an oracle, the Professor at the princess's desire is selected for the office. He is to be properly coached, and then by adopting the modern system of cooking, in which he must be an adept, a fortunate result will be obtained:—

You may perhaps have noticed what a lot of things are done
By cooking, yes, by cooking,
And it may be that a competition is very often won
By cooking, yes, by cooking.
On plan you find there's nothing underneath a three-foot wall,
A column in the attic perhaps has no support at all,
You can make your elevations too look either low or tall
By cooking, yes, by cooking.
For it's really very funny
How imposing plans may look,
When handled by a man who
Understands the way to cook.

The Association did not improve the occasion to advertise how much it does to promote the knowledge of cooking, but its services were not likely to be overlooked by actors or audience. The Professor's get-up as the oracle was not reminiscent of Egypt or Greece, but it was hardly becoming to describe the Professor as looking as silly as if he were one of the Council of the Institute. In spite of his appearance the Professor was sensible, and oracularly declared that the princess could bestow her hand on a budding architect. The other explorers also found charmers, and the Enigma ended with the departure of everybody for "dear old England" and a chorus of victory:

Clash the cymbals, trumpets sound,
Proclaim to every nation,
How after years the lost were found
By the Association.
So clash the cymbals, beat the drum,
Proclaim to every nation,
With what success they homeward come,
The great Association.

The music was by Mr. Leonard Butler. The following members (assisted by some ladies) took part in the play, and amused a very crowded house:—Messrs. Alfred Stalman, S. Constanduros, H. Seton Morris, A. G. Turner, Frank Collins, F. D. Clapham, G. B. Carvill, J. H. Wilson, P. Albert, G. Bailey, Douglas Carvill, S. Elston, G. H. Frow, Howard Holt, A. C. Kelly, A. Lovejoy, G. J. T. Reavell, W. P. Swaby, F. Thomas.

THE ART OF SIR J. MILLAIS.

A LECTURE was delivered at the London Institution on Monday by Mr. Whitworth Wallis on the pre-Raphaelite art of Sir John Millais. It accordingly covered the period of his work from his early student days, when he, Rossetti and Holman Hunt began to conceive the revolt against the conventionalism of the schools, in order to bring art back to the truth of nature by founding the pre-Raphaelite Brotherhood, down to 1860, when he began to introduce into his works the elements of romance. The works of his pre-Raphaelite days were illustrated by a series of lantern slides, which, though they did not exhibit the colouring of the artist, showed the composition of the picture and the standpoint of the Brotherhood. In the case of nearly every picture which was thus thrown upon the screen, Mr. Wallis dwelt upon the intense realism of the conception as a proof of the striving of the young artists to keep in touch with nature, and he quoted also the terms of ridicule with which the works were invariably greeted by the critics and the public on their first appearance. *The Carpenter's Shop*, for instance, in which the child Christ is represented as having injured his hand, and which was a very violent realistic departure from the Italian traditions and conceptions of the Saviour and the Virgin, was denounced by the critics of the time as even blasphemous. Such a reception, the lecturer said, showed how ignorant the public was to the true principles of art, and how necessary as an educative influence the revolt of the young artists had been. No such criticism would be levelled against a similar work now, so far had the influence of the Brotherhood contributed to the moulding of English opinion. Apart from the great number of works of wondrous technique, of deep earnestness and intellectuality, of extraordinary realism and of great achievement in the expression of emotion which Millais during this period produced, the lecturer seemed to regard this bringing back of art to the domain of nature as the crowning work of the Brotherhood. In half a dozen eloquent passages he spoke of some of the pre-Raphaelite paintings of Millais as the greatest and most impressive ever painted in England. Posterity would have to decide his position in the art history of the world, but so far as English painting was concerned he stood unquestionably paramount, and even if his days had been prolonged he could not have enhanced the brilliant record he had left behind.

LAW IN TASTE.

ON Saturday last Professor Courthope, the Professor of Poetry at Oxford, delivered the first of a series of lectures on "Law in Taste," supplementary to those he has already given on "Life in Poetry." He dwelt, in the first place, on the anomaly that the English, who in all other departments of life were most observant of law, refused to recognise its operation in the sphere of art and taste, and he ascribed the fact to the bent of the national character, at once sceptical and practical. It was said that no law of taste could be discovered, and that, if it could, it would be of no use. In answer to the first objection, he pointed out how universal in all ages and nations had been the endeavour to formulate a theory of fine art; and in answer to the second, he said that the prevailing anarchy of opinion was in itself an argument for trying to place our æsthetic perceptions and preferences on a basis of reason. His inquiry should be directed to this practical end. Starting with an acceptance of Aristotle's distinction between the mimetic and useful arts, he said that all fine art had a twofold purpose—imitation of an external object and the production of imaginative pleasure. A true likeness of the thing imitated was, of course, a primary requisite of art, but beyond the mere correct representation of nature, all fine art aimed at an ideal object. This object of imitation had been called in ancient times the beautiful, and in modern times the characteristic, but its absolute nature could not be ascertained. Since then all in this region was so uncertain it was necessary to estimate the quality of artistic imitation by reference to the pleasure which it produced. The necessity had been denied by modern philosophers, but in point of fact it was impossible to dissociate our perceptions of beautiful, ugly and sublime things from the perceptions of pleasure which accompanied them. The question he proposed for consideration in his first lecture was whether æsthetic philosophy, as such, apart from artistic practice, had revealed any law regulating ideal imitation and imaginative pleasure, and if no such law had been discovered by philosophy whether any other method of investigation could be pursued. In a brief sketch he showed the way in which his subject had been treated by philosophers in different periods, following the divisions in Mr. Bosanquet's "History of Æsthetic," a book which he strongly recommended to the study of his hearers. The periods which he noticed were the Greek civic period, the Alexandrian-Roman period, the Mediæval period, the period of the Renaissance, and the modern period following the French Revolution. Within these

limits he mentioned the leading questions which had been raised with regard to ideal imitation and the treatises in which they had been discussed. Then, turning to what had been said on the subject of imaginative pleasure, he noticed the reasoning of Plato, which had led him to conclusions like those of the English Puritans. From Plato he passed to Aristotle, whose views about artistic pleasure he warmly defended against the modern Hegelians, who had censured Aristotle for allowing moral considerations to enter into his æsthetic judgments. Aristotle, he said, was always thinking of man as the member of society and a State, and there was, therefore, in his mind an inseparable association between art and morality. The German philosophers, on the other hand, treated man merely as an isolated sentient individual, and, looking at him in this aspect, Kant and his followers were at least consistent in restricting their investigation of the nature of æsthetic pleasure to the perceptions of purely physical beauty and in excluding from it the pleasures of fine art. The Hegelians, however, who followed Kant in excluding moral judgments from æsthetic perceptions, claim poetry as falling within the purely æsthetic domain. This, he maintained, was inconsistent. An art like poetry could not be justly appreciated apart from the religious, moral and even political conditions of the society in which it was produced. Summing up the results of this survey, he said that, though æsthetic philosophy had raised questions of the greatest abstract interest with regard to the nature of the beautiful, it had discovered no law or principle which was of any assistance in the critical appreciation of works of art. Might we not be more successful if, looking away from the abstractions of philosophy, we proceeded inductively by observation of concrete works of art? Art preceded criticism; and the work of the greatest poets, sculptors and painters had been produced without any conscious application of the philosophic principles which were afterwards discovered in it. We knew, by the enduring pleasure it produced, that this work must have been produced in conformity with the law of nature and true taste. Here then were the living monuments of æsthetic law. But it would be idle to look for an universal law of taste, for though all great art proceeded from a single divine source of inspiration, which imposed its own unity on the artist's conception, yet, operating as it did within differently constituted minds, it manifested itself to the world in the most various forms and types. Moreover, these forms did not spring out of the isolated conception of the individual artist, but were very largely the product of the common perceptions of society, reacting on the imagination of the artist who had the gift of representative expression. We might, in fact, observe in every nation a well-defined character which gave a particular bent to its art and determined its law of taste. In what way could we construct from the observation of character in national art a standard of taste capable of checking the anarchy of individualism? By the common recognition of those works of genius in which the spirit of the great artist, representing his nation, has found the means of expressing itself with most life, freedom and spontaneity. It was the business of criticism to discover the law underlying such creations. Life in art and law in taste were, in fact, the opposite sides of the same principle. Life in poetry was the reconstruction in an organic form of the universal ideas or impressions which the mind derives from nature. Law in taste was a just critical perception of the conditions of life which constitute the organic unity of the poetic creation. The critic, like the poet, must, in a sense, be born such. He, too, must be the representative of society. He must have an instinctive knowledge of the source of the artist's inspiration, and he must be able to follow him sympathetically in all the processes of his invention, but he must also be able to comprehend his limitations by comparing his work historically with that of his predecessors and with work of the same order produced in other nations. By constant and patient comparison of this kind the critic would gradually form in his mind a standard of judgment by which to estimate the value of contemporary art. The Professor concluded with a hope that he might be able before his term of occupying the chair closed to illustrate the line of thought he had suggested. It was his intention in his next lecture to treat of the idea of unity common to all art as it was put forward by Aristotle in his "Poetics;" in the three following lectures to show how the idea of unity reappeared with various modifications in the criticism of the French, German and English nations respectively; then, in four lectures, to take Chaucer, Shakespeare, Pope and Tennyson as the types of poetical art in different periods of English history, showing how each preserved in his work the unity and continuity of national character which determines the law of taste; his last lecture would be devoted to considering the place which the training of taste ought to occupy in a system of liberal education.

The Parish Church, Knutsford, on the restoration of which 2,000*l.* has been spent, was reopened on Sunday last.

NOTES AND COMMENTS.

NAPOLEON I. played many parts, but few of his admirers were aware that he once was not afraid to undertake an architect's duties. In the archives of Ajaccio are a set of plans for a hospital at Oliveto which he prepared, the site having been selected by him. It is not unlikely that the site will at last be utilised, and that the Emperor's plans will have some influence on whatever design is adopted for the new building. There is at present in Ajaccio a civil hospital and a military hospital. As the town is gaining a reputation as a winter resort it is proposed to remove the hospitals and to erect a casino and a large hotel on the sites. A mixed hospital is therefore to be built at Oliveto. The plans of NAPOLEON might be described as being an early recognition of the pavilion principle, for three blocks of buildings are shown on them which are united by glazed galleries. The subject will shortly be considered by the Administrative Council.

PRINCESS CHRISTIAN has succeeded in securing upwards of 11,000*l.*, approximately a third of the sum required for the erection of the permanent building proposed for the Royal School of Art Needlework. HER MAJESTY'S Commissioners for 1851 have granted an admirable site, at a nominal rental (of 200*l.* per annum) subject to the proviso that the building is commenced within a fixed term now nearly expired. The Princess accordingly appeals for assistance to complete the balance of the amount required in order to have the building commenced before the year closes. For twenty-five years excellent work has been done in the temporary buildings of the school, and the grant given by the London Technical Education Board shows the appreciation of the training classes. The school is no longer confined to assisting ladies in reduced circumstances, but has been widened so as to embrace the training of technical teachers, such as are now employed to train women, both in art needlework and applied design, under the system pursued upon the Continent and elsewhere.

OLD stained-glass obtains high prices in Germany, for a collection of fifty-nine examples of various sizes from Schloss Langenstein was sold on Thursday last in Cologne for 223,000 marks, or over 11,000*l.* Most of the examples were purchased for museums. A window having for subject the *Crucifixion*, which was designed by HANS HOLBEIN, was acquired for the museum at Basle, the price being 29,800 marks. A *Mater Dolorosa* (5,100 marks), a *St. Wolfgang* (7,900 marks), an *Ecce Homo* (4,600 marks), and a *St. Christopher* (6,500 marks) will also enrich the Basle museum. They were all painted from HOLBEIN'S cartoons, and a more fitting place could hardly be found for them than a town where the artist lived for many years. Some windows designed by HANS BALDUNG GRIEN were likewise secured for the museum. A sum of 19,800 marks was subscribed to purchase a window for the Cologne museum. A figure of *St. George*, which cost 14,400 marks, and other saints sold at a lesser price, will be sent to the Berlin museum. The museums of Nuremberg and Solothurn will also receive additions from the collection.

It is hard on the competitors for the capitol at Harrisburg to have the conditions set aside, but it is adding insult to injury when the Supreme Court of Pennsylvania says they have themselves to blame for the dishonest conclusion of the affair. According to the sapient judges who form that tribunal, the competitors should have been aware that the commissioners for the building were acting illegally when they called in experts to examine the designs, for authority cannot be delegated in America. The *American Architect*, in commenting on the fiasco, says:—"Punic faith, however immediately profitable, is seldom advantageous in the long run, and unless the Legislature should take action this winter to redeem the good name of the State, Pennsylvania must take its place, in the eyes of the world, with the other communities of repudiators which have disgraced American civilisation.

Naturally enough, the Pennsylvania newspapers throw the responsibility for the scandal upon the present members of the Commission, as individuals; but the rest of the world will soon forget the personal part of the matter, and will remember only that the programme by which the best and most scrupulous part of the profession was deceived was signed by the Governor, the Acting President of the Senate, the Speaker of the House of Representatives, the State Treasurer, and the Auditor-General of the Commonwealth of Pennsylvania; and documents inviting confidence on the part of the public, and signed by these officials, will excite laughter for a century to come." As Mr. COBB, of Chicago, has contrived to carry off the contested prize, the *Inland Architect* of course takes a complacent view of the transaction, saying:—"Now that Mr. COBB has been appointed the matter can certainly rest, as this action of the Commissioners has placed all chance of any misuse of State funds beyond the power of manipulation by them or anyone else. Architecturally the design will be creditable, and if the building costs more in the end than was originally appropriated it will be at the wish of the people, and every dollar appropriated will be spent on the building and go as far as possible commensurate with good construction. While the appointment of Mr. COBB does not place the action of the Commissioners in regard to the original competition in a more favourable light, it ends the matter in a much more creditable manner than the outlook promised. The incident, as a whole, will cause architects to look with less favour than ever upon competitions for public buildings."

A TRAVELLING studentship of 50*l.* is offered by the Painters' Company for the encouragement of the study of decorative painting. The studentship is open to competition by students between the ages of twenty and thirty-five in any recognised school of art or other institution devoted to the study of applied art in any form, and situate within the limit of the larger metropolitan postal area. Each set of designs sent in competition must bear the author's distinctive mark or motto (but not his name), and the title and address of the institution by which they are forwarded; they must also be countersigned by the responsible officer of the institution. The set of drawings must be accompanied by a sealed envelope marked outside "Competition," and containing the author's name and address with the mark or motto borne by the drawings. The drawings and envelope to be addressed to "The Clerks of the Painters' Company, Painters' Hall, Little Trinity Lane, London, E.C." Not more than two sets of designs may be forwarded for one competition by any one institution. The following drawings must be submitted by each competitor:—1. A drawing from the antique or from life. 2. A study from an example of coloured ornament. 3. A set of original designs for coloured decoration as follows:—(a) One side with the recess of a vestibule 15 feet square and 15 feet high; (b) the ceiling of the same, including the soffit of the arched recess, scale $\frac{3}{4}$ inch to a foot (the details of the cornice and other mouldings are left to the competitor, who may add any moulded features at his discretion); (c) a portion of the ornament in the above drawn to one-third full size. The spirit and character of these designs will be considered rather than elaborate finish. All the drawings must be delivered at Painters' Hall on or before March 1, 1898. The successful competitor must be prepared to spend not less than six months in Italy in such places as the committee may direct.

SOCIETY OF ARCHITECTS.

ON the 25th ult. the opening meeting of the session 1897-98 of the Society of Architects was held in St. James's Hall, when the following address was delivered by the president, Mr. T. Walter L. Emden, J.P. :—

It has been the pleasure of this Society to elect me to the chair of its President, an honour which I appreciate most thoroughly, and the more so inasmuch as the election has been unanimous.

I would tender to the Society generally, as well as to the members of council and officials, my most hearty thanks, not only for the support given me in this instance, but also for the pleasant relations which have existed between us ever since I became a member of this Society.

It may seem ungracious, but it certainly is not meant so, if I say that I do not believe in societies as at present constituted, and that for most of the years of my professional existence I stood aloof from them and only joined this Society because of its efforts to obtain a Registration Act for architects, and with a desire to help in this programme. I say this, not as being against such institutions which have sought to do good work and no doubt have done much, but because I find, and have always found, that while they purport to give the public an assurance as to the capabilities of an architect, practically without compulsory registration they cannot do so. There is no compulsory regular examination, and no diploma issuable under the law as in the case of other learned professions; indeed, while anyone can set himself up as an architect, without any examination, and without previous study, experience or competent knowledge, and as long as examination is voluntary, the best benefits of these societies are but small security to the public.

Examination is no doubt more or less insisted on before entering the Royal Institute and other societies; but this does not meet the case, as while the use of letters, indicating the connection of persons using them with any society, may mean that some examination more or less has been accomplished, many, indeed by far the greater number, do not belong to any society and yet practise.

Many of the most competent men practise without belonging to any society, so that it is seldom the public inquire, or care, if the professional man employed belongs to a society or not. Let me again point out, and insist upon the fact, that as anyone, never mind what his position is, can call himself (even be he a labourer, or, as in a known case, an undertaker) an architect, surveyor, or engineer, without let or hindrance; and as voluntary examination can afford no real protection to the public that the architect employed will design sanitary and properly constructed buildings, I can but conclude that, except absolute compulsion is enforced under an Act for Registration, nothing will accomplish the exclusion of the incompetent.

The Profession.

The duties of the architect, or master builder, no doubt originally covered the engineering efforts as well as the architectural efforts of the ancient world. Unfortunately, at the present day in England, and probably to a great extent because there is no State intervention in the shape of compulsory examinations (as in other countries), there has grown up in the work of the architect less knowledge of construction in its larger form, and a separating of engineering from the architectural work, and hence want of artistic design in our great engineering works.

The engineer has to be called in when a large or difficult work of construction has to be carried out, and the designs of our railway and other bridges, and railway stations, &c., show the want of artistic effort there is in dealing with what are now called engineering works, as distinct from architectural.

Could we, for an instant, compare modern aqueducts or viaducts with the ancients with advantage to the modern designer?

Much has been done of late years by various Acts of Parliament relating to buildings and for the preservation of public health.

A serious difficulty, however, is that each step requires an Act of Parliament framed more or less by men with incomplete knowledge or experience of the necessities, while the alterations necessary in the present Acts so indirectly affect the public that it takes years before even the most simple or urgent necessity for alterations or modifications in the law become apparent and obtains a remedy.

I cannot but think that much might be done if the Local Government Board could be made more regularly and consistently the recipient of information gained by local and other authorities of the various necessities in building and its sanitation. The Board should be authorised to set machinery to work to obtain from the various surveyors in the districts regular reports, and could therefrom draw information for the alterations necessary in our Public Health and Building Acts, invoking the action of Parliament in the same way as in a

question of insanitary areas by a provisional order. Much would thereby be gained and dangerous delays saved.

Undoubtedly, and more particularly, as far as London is concerned, the New Building Act is a step in the right direction, and one cannot but admire the courage and perseverance of Dr. Longstaff, L.C.C., who was chairman of the Building Act committee. The more so that he, a layman (so far as building was concerned), set himself to work to become master of the enormous mass of details and all the *pros* and *cons* and necessities for alteration, and should have succeeded in carrying through so voluminous an Act, as this necessarily was, to what must certainly be called a successful issue. No doubt it will prove of great advantage to London, and while its errors must be remedied as they appear, its benefits must not be forgotten, as the Act is a substantial step in advance.

One of the difficulties which has to be contended with by the professional man is the overlapping of the powers of the various authorities. It is a crying evil in London where the central authority deals with frontage lines, projections, construction and all such-like matters, and puts in action its own surveyors, that there is in each district the surveyor of the local body also dealing, more or less, with the same subjects and other overlapping duties.

If the central authority laid down the rules and regulations under such Acts as deal with these questions (after consultation with the local authorities) and the local authorities administered them, much expense to building owners would be saved, and to the public also, by preventing the duplication of officials and duties and avoiding further friction, as useless as it is delaying, and thus facilitating building operations to an enormous extent.

To pass a set of plans under the present system is not only a complicated, long and harassing process, costly to the building owner, but without increasing the protection of the public; indeed, is wasteful and unproductive of any benefit at all.

A very substantial fee might well be obtained from the building owner under the simpler system for the passing of and licensing plans, leaving the owner better off than now, and making the public purse the richer.

As a step in the right direction it ought to be possible, and I think it is possible (were an effort made), to so arrange the surveyorship for the authorities that one surveyor in each district should suffice, and that the central body should delegate (as I have suggested, after laying down the rules under which the local authority should administer) the active administration to them, and so avoiding overlapping and facilitating very considerably building operations.

Another complication in town building is consequent upon our system of leases and the necessary intervention of the surveyors to freeholder and intermediate owner; and here, as private rights are touched, it is difficult to frame laws to deal fairly with it, to save the uncertainty, expense and delay, and yet fully protect owners' just rights. Indeed, it is so difficult and delicate a subject to handle that it will be a bold man who accomplishes it.

I make it as a suggestion, but as that only, that the building owners should be at liberty, after notice given to the freeholder or superior landlord, to make the alterations he may deem necessary, subject to a right to the freeholder or superior landlord to formally object, and the objection (failing agreement) being heard and determined by a permanent official under the Local Government Board.

Sanitation.

I should like to turn for a moment to sanitation, and ask you to consider how much might have been accomplished by the present time, how many lives saved, and what spread of disease prevented, had the professional man to pass through examination and obtain an intimate knowledge of the necessity of sanitation first, before practising. What I say does not apply to individuals, many of whom have done great and important work in this direction. But can it be said the profession, as a body, has a thorough knowledge of this subject? By the neglect of each Government to provide for compulsory examination and the registration of competent men, they have now much to answer for in this direction.

In England, with our Free Trade principles, we have, I think I am right in saying, hundreds of systems and apparatus stated to be, and no doubt credited with being, good and capable of accomplishing sanitary perfection, but except by the test of experience, what examination into these claims is brought to bear, and specialists, each with their own specific, are called in instead of the architect, and no system is thoroughly or effectually exploited.

Experience may often be dearly bought by those who have to submit to the use of some so-called sanitary apparatus or arrangement of house or other drainage until its defects are discovered.

It is no one's business to say which is best, and even our local authorities pin their faith to different systems, no doubt recommended by their officials. How, then, can professional men be expected to deal more thoroughly than the authorities do?

Surely this is folly, when so much depends upon what is used.

Can it be wise in an age when vast numbers congregate together and great cities are created in our own Empire for such a state of confusion with regard to this most important factor—sanitation—to be allowed to go on unimpeded and almost unthought of until some great calamity visits us?

The fact is no public body and no authority likes to take the responsibility of recommending anything new; but I contend that the Local Government Board should be obligated by law to take up and examine into the necessities and lay down what should be done.

In latter years no doubt advance has been made, but until some such power as I have before suggested is delegated to the Local Government Board, and those whose duty it is to design and superintend buildings are compelled to pass a thorough examination, no thorough knowledge can be assured even though there depends upon it the life and the health of every individual citizen.

Art.

With regard to the question of art, undoubtedly much progress has been made during the Victorian era. When we look at the houses built not long before the accession of the Queen to the throne (such houses as form the various squares of London) we obtain at once a very fair exemplification of what was considered a good class of dwelling-house of that period. Compare these with a good dwelling-house of the present period. Sanitarily and constructively we have improved, but certainly in comfort, luxury and artistic design the advance made is strikingly great.

Take again the shop of sixty years ago, and compare it with the artistic design of much of the work of the present day, and the advance will again be strikingly seen.

If we turn from this to a higher branch of work, to our more public buildings in the shape of churches, hospitals, theatres, music halls, hotels, restaurants, &c., at once the luxury and artistic improvement are so marked that one can hardly believe the whole of it has been accomplished in the space of one reign. Moreover, when it is considered that the improvement has come about not because the State has lent its aid, but has been accomplished under many difficulties, it becomes a useful study to consider not only how much greater it would have been, but how much waste in its accomplishment might have been saved had compulsory examination and registration protected the investor and public. This advance, however, speaks much and well for the energy and artistic effort of the architect, and considering the difficulties he labours under should not be forgotten.

Too much credit cannot be given to those who have fostered and increased the strength of artistic effort in this country, overshadowed as it is by the question of almost everything having to be done by private enterprise, and that even in the most elaborate decoration of buildings for public use, the owner's first consideration must be that it shall pay.

I would, before leaving this subject, like particularly to draw attention to the great spread, among the people at large, there has been in Her Majesty's reign in artistic teaching. Many institutions and schools have grown up by the efforts of the City and London County Council and other corporations and public bodies in the establishment of technical schools, and much has been done to educate those who have taste and intelligence and are willing to devote their spare time to the study of artistic work.

A short time back a small exhibition was made at the offices of the London County Council of work turned out from some of its technical schools, the work for the most part (I think I am right in saying) of young people of about fifteen years of age.

The work consisted of some excellent examples of enamel, repoussé work, carving, painted glass and joinery, plumbing and other work. Without taking into consideration the comparatively short time for which these schools have been at work, the work generally was highly creditable, while the artistic work showed such promise as bid within a generation to take away the stigma which has so long been placed upon the English people, that they are wanting in artistic design and taste in their work as compared with that which comes out of the French and some other continental workshops.

It has always seemed to me a pity and a neglected opportunity on the part of trades unions that they do not make an effort to improve their workers, set up an examination in their trades for each union, and thus be able to assure employers as to the competence of the man employed, and enable, by its certificate, the workers to show which are its best men. It would certainly serve a useful purpose; more useful, I think, than some of the other work the unions do, and I believe it would place them in a better and higher position in public opinion.

I have often heard it stated that if the profession of architect were to become a registered profession dealt with by compulsory examination that the artists in the profession would be

hampered and prevented from taking up the profession; but when it is seen that not only many of those who are actual workers with their hands by day can in their evenings turn out such good work, this reason, against the compulsory registration of architects falls to the ground, as it would also if tested by the result of the efforts which in the old days were made by the great architects and artists who often enough struggled through years of hard work in manual and other trades to make themselves, as they eventually succeeded in doing, artists. Indeed, the original architect was the master builder.

It cannot be for a moment supposed that artistic effort can be deterred or kept back or even inconvenienced by a knowledge of construction and sanitation.

It would be as reasonable to say that a sculptor or artist should not know the anatomy of the body, as his examination in it would be detrimental to his skill.

I cannot think either that the Royal Institute give credit to such a reason, or they would not have established an examination for those who wish to enter their ranks.

Construction was the duty of the first designer of a building when there was no distinction of engineer and architect. As civilisation grew the ornamentation, or the artistic portion of the architect's work, grew also; but it grew out of construction, and should be the refining and finishing of it and consequent to it. The best specimens we have of architecture are those which by form and construction give necessity for the ornamentation.

Drawbacks to the Profession.

It would be difficult to say that the architectural profession was not a good one for young men to enter; but it can safely be said that it would be a better profession for them to enter if its status were more assured, as it would be if they had to pass a compulsory examination, proving their knowledge and title to professional position before assuming it.

It would by no means discourage those who were worth encouragement, while it would keep out the element of uncertainty and be an assurance to the public of the capability of the architect to design a building, and his capability also of seeing that the construction and sanitation were well carried out.

We are often told that vested interests must be considered, and such vested interest in the profession would mean admitting large numbers of incompetent men; but the delay in obtaining compulsory registration and examination only allows the evil to grow, and its establishment would stay it altogether, while death would, within but a few years, deal with the evil as it existed at the passing of the Act.

But I personally do not agree that this vested interest is such a large factor, at least where it absolutely covers incompetent men.

When Parliament intervened to protect the public from quacks, both as doctors and surgeons, and later as dentists, there was this same vested interest and incompetency; yet where is to-day? and all this has been accomplished during Her Majesty's reign.

No, the real difficulty is poor humanity, poor selfish humanity; those who fancy their position is now assured and forget others, and would keep them outside the pale, those who think that having some letters to add to their names, forget the public and the greater interests at stake, for their own more personal interests, and prevent, or at least do nothing to help, the cause this Society has at heart.

There is a strong feeling of jealousy in some quarters, and of a dog-in-the-manger principle (forgetful of all public duty) which causes opposition to what all are bound to acknowledge would be good and beneficial if accomplished.

This feeling raises difficulties of detail and petty points, enlarges upon them, and while many of them are so trivial as to have no real existence, they are used all the same to conceal the real desire not to help the cause of registration. I trust this course will not serve their turn, and will not succeed in preventing the remedy being eventually obtained.

It must, however, still remain for this Society to devote its energies to obtaining the support of Members of Parliament pledged to bring about registration, and to proving the great necessity of it to those who take the lead in work for the public good; for indeed, whatever assured position it may give the professional man, it is before all necessary for the public benefit.

I trust my words and earnest desire may accomplish something in the direction to which for many years I have lent my services, and I trust my poor efforts may succeed in raising an interest, a real and deep interest, with the members of this Society, and that this year will bring registration nearer accomplishment. I want the country members to call meetings in their own districts, to come to the Society's meetings, and I believe the calling and holding the meetings wherever possible will bring together a weight of opinion which will demand the attention (as earnestly as other not more important, but possibly more importunate, questions do) of your representatives in Parliament.

It is so often said by the more retiring men, and by those who have not so much self-assertion as others, and sometimes, too, no doubt, as an excuse by those who wish to save themselves work, "Oh! What can I do? I have no influence or position." That is not correct. All can at least influence his neighbour, all can help to make a meeting, and can at least communicate ideas to those immediately around him, and, as every grain is necessary to the formation of the whole stone, remember that even the smallest grain of your help is often of the utmost importance to the whole.

Let me then again ask the help of members (and I trust not ask in vain), large or small, to push forward the great work of registration, and I would ask, too, that it be freely given, so that in a few years—I hope in the reign of our gracious Queen—we can look with pride on a work done for the public good and for the elevation of the standing of the profession to which we belong.

THE HISTORY OF ARCHITECTURE.

A COURSE of four lectures on architecture—the Hermione Lectures—was delivered lately in the Alexandra College, Dublin, by Professor Aitchison, A.R.A.

Professor Aitchison commenced by speaking of early architecture. It had mostly been an effort of mankind to raise monuments to superior powers, and these monuments had been built to express man's awe, reverence, thankfulness and gratitude to those powers for benefits conferred; and as gratitude was defined as a keen sense of favours to come, so these temples were built to induce those powers to extend protection in the future over the nation and to grant it favours. Now, architecture was an attempt to emulate nature's organisms—that was, to make each building answer its purpose as perfectly as possible without excess of material, and to impress on it the character it should have, so as to excite those emotions that were proper to its use. The lecturer then took up the subject of Greek architecture. The golden age of Athenian architecture that set in directly after the defeat of the Persians at Salamis and Plataea produced an architecture of the greatest æsthetic perfection the world had yet seen. The supreme Greek mind seemed to have instinctively felt that simplicity was the road to the sublime. It was impossible to suggest anything more simple than the Doric style; but this simplicity was the result of elaboration, for no refinement that was needed for perfection was left out. The Greek temple was the glorified Greek wooden hut, eventually surrounded by a verandah. This traditional account of the origin of the Greek temple had in their time been treated as mythical, but he thought without success, for Pausanias told them that some of the original oak columns of temples were still preserved as relics, and Hittorf had collected from the paintings on Greek vases the gradual conversion of the wooden posts of early Greek buildings into Doric or Ionic columns; while M. Auguste Choisy had explained the origin of the fascias of the Ionic entablature by their original wooden construction. No Greek treatise on architecture had come down to them. Almost all they knew about Greek architecture, except from its remains, was found in Vitruvius, a Latin writer, who dedicated his work to Augustus. He gave them the names of the Greek architects who wrote treatises on architecture, and on the works they had executed. Having described fully the structure of the Greek house or hut, and the temple, the lecturer went on to say that the Greek orders, as they were called, were two, the Doric and the Ionic, and perhaps three, to include the Corinthian as well. The Greeks were practically the inventors of mouldings; and, as Viollet le Duc said, roughly speaking architecture was moulding, and though the Greeks were as sparing of moulding and ornament as a miser was of gold, what they did approached the nearest to perfection of anything man had yet done. The lecturer went on to explain some of the elaborate means that the Greek architects used to obtain their simple effects, and said the Greek architect had ample sunlight, and he made it play different harmonious tunes on his architecture from dawn to night. The audience must have seen imitation Greek architecture here and in England, but in both countries they had a misty air and feeble sunlight, even when there was any, so that for most of the year nothing was so ineffective here as Greek architecture, just as nothing was so effective in its native climate.

In the second lecture of the course "Roman Architecture" was treated.

The Professor said that in Roman buildings they first saw the arch, the vault and the dome brought within the pale of architecture, and the entablature abandoned, while the novel use of concrete, encased in a brick or stone facing, rendered gigantic buildings possible in every corner of the empire. The Romans undoubtedly borrowed some of their architectural notions from the Etruscans, though as a rule they continued,

with certain modifications, the debased architecture of the Greeks, for they had intercourse with Magna Græcia and Sicily at least a century before Flaminius defeated Philip in 197 B.C. After the irruptions of the Gothic and Renaissance barbarians only a few fragments of the golden age were left. The Pantheon, which was built at the expense of Agrippa in Augustus's time, was destroyed, it was believed, by fire, and the portico was believed by M. Chedanne to be a late and bad copy of the original; the Rotunda itself could not have been built before the days of Hadrian, for in all parts of its structure bricks of his day had been found. Vitruvius gave four orders of columns—the Tuscan, the Doric, the Ionic and the Corinthian, and after his day the Composite was added. The first instance that the lecturer knew of the use of the Composite was in the Arch of Titus at Rome. A fine example of the Tuscan order was to be found in the portico of St. Paul's at Covent Garden, London. The Doric was not much used by the Romans, and was mostly unfluted, though there was a fluted one of Diocletian's time, and one at Cora, but the latter was bad Greek. The principal example was that of the Theatre of Marcellus, where the Doric was without a base, and this they knew was built or completed by Augustus. The Ionic also did not take with the Romans. One must, however, consider that debased Greek art was in those days a living art. When one spoke of Roman architecture he was practically speaking of the Corinthian and Composite, for except in the examples which the lecturer gave, there were practically no Doric or Ionic columns, save in the piled-up storeys of the Coliseum. The infinite variety of Greek bases gave place to two in Roman work, one with two plain toruses and a hollow between, and one with two toruses and two hollows divided by two beads. The extreme simplicity and severity of the Greek entablature, even in the Ionic, which, beyond the sculpture, was only ornamented with a few carved mouldings, did not suit the taste of the Romans, who in their most ornate entablatures did not leave a piece of plain surface in the cornice, except in the face of the dentils. One thing was quite clear, that the loving study of mouldings, profiled so as to take full advantage of the sun and the atmospheric peculiarities that had so distinguished the architects of Athens, was abandoned, and coarse and almost stereotyped profiles of mouldings were substituted, for, as a rule, all the Roman mouldings were rough imitations of the Greek ones turned in by compasses. In the Roman monuments subtlety gave way to size, profusion of ornament and costly materials. However, the magnificence of Rome must have been unique, as every marble quarry in the empire, and almost in the then known world, had been ransacked for beautiful or rare marbles. Most of the great public buildings were covered with bronze tiles, plated with gold, and they found in some Byzantine churches inlays of mother of pearl. The Saracens in 663 A.D. took the vessels and cargoes that were conveying the gold-plated tiles of the Pantheon to Constantinople, and Bernini transformed the bronze coverings of the beams of its portico into the hideous baldachino of St. Peter's. The great epochs of Roman building were those of the end of the Republic and the days of Augustus. In treating of the orders, they found in the Greek ones, altered to meet the coarser taste of the Romans, the elements of Roman architecture, and where temples were the objects to which it was applied. The Greek knowledge of construction was adhered to, that was what was called the post and lintel style, and the Romans considered art to be the overlaying of the real building with columns or pilasters and entablatures as at the Coliseum. But though the Romans were not artists they were born constructors and had realised the importance of architecture to a nation more vividly than any other great race since the Greeks, and they were too practical to spoil their buildings even in the interests of what they supposed to be art. As soon as such enormous buildings as their baths became a necessity they had, as it were, to throw a tub to the whale. At what time they learnt to vault, and from whom they learnt it, the lecturer did not know, but they vaulted all the great chambers of their baths and sprang their vaults from the entablatures. They also wanted enormous windows to light vast halls, and this entablature cut the windows in half, so they kept a piece of the entablature over the columns which supported the groins of the vault, and cut the rest away. The grand halls of the baths consisted of a row of isolated columns on each side, each column carrying its own piece of entablature on which the groin points bore; with the vault between one column and the next, and so far as was known this went on to Diocletian's time, when the slice of entablature was frankly sacrificed and the arches sprang from the capitals. Professor Aitchison dwelt at length on the basilica, the palace, the triumphal arch and other classes of buildings, and said the one thing that the Romans held to be essential to great men and to great nations was dignity and magnificence, and this the Roman architects always managed to impress on their public monuments. Those few columns that still remained, half buried, of the Forum of Nerva, struck even the casual passer in a carriage as dignified

and almost sublime. They remembered Byron's apostrophe to the column of Phocas:—

Tully was not so eloquent as thou,
Thou nameless column with the buried base.

The lecture was illustrated throughout with excellent lime-light views."

The subject of the third of the Hermione Lectures was "Gothic Architecture." It was said that the third epoch of architectural advancement in the West selected to lecture on was Gothic, and though three epochs came between it and Roman it was so wondrous and so novel as to throw the others into the shade. The Professor, of course, spoke of the Christian art of the Romans after the seat of empire was removed to Byzantium, from which they got the name Byzantine architecture. This was one epoch, another was Romanesque, from which Saracenic Gothic sprung, and then there was the Saracenic. Remains of the last phase of architecture were found in Spain, in Portugal, in Sicily and its influence was felt in the South of France, in South Italy, in Madeira and the Canary Islands, and perhaps in certain parts of Germany, not to speak of its native habitat in Syria, Egypt and Mesopotamia, and those parts which the Saracens conquered and inhabited. Some architectural historians treated Romanesque as Gothic, and perhaps they were right in the sense of race, but the lecturer used the word Gothic technically for that period when the Romanesque had deeply felt the influence of Saracen teaching and of the Saracen architecture of the East. In treating of Gothic, he admitted that it was difficult to draw a line. Romanesque art was constantly improving, and from it Gothic sprung; still he thought it might be safely drawn at the period of the flying buttress. For western architects, Romanesque and Gothic had peculiar charms. They were still a little barbaric in their taste, and they still had a little of their ancestors' blood in their veins. The lecturer having traced in detail the development of Gothic architecture and described at length the method of treatment employed in the interior and exterior of Gothic buildings, continued by saying that the Gothic architects got so skilful that they tried at last to give the appearance of the skeleton of a plant to their buildings. Tracery grew so thin as to be scarcely perceptible. He must say a few words about Beauvais, as it was meant to be the triumph of French Gothic cathedrals. It was begun in 1225 with the avowed intention of surpassing Amiens, and its choir was still, he believed, the highest in the world, being 153 feet. In 1284 the walls bulged and the central tower fell. The rest of it was built in 1550-55, and the tower, intended to be 455 feet high and to rival the height of St. Peter's, fell down in 1573. The east end had double tiers of flying buttresses, supported by buttresses that ran up from the walls of the aisles to the height of the parapet of the chevet, and in the misty twilight of late autumn reminded one of the forests of banyan of which Milton spoke. However they might deplore the excess of ornament and elaboration in the Late Gothic, they could hardly say that it was not effective and striking. Even St. Wulfran's, at Abbeville, though most of its walling was covered with small panelling, which blurred the effect of the elaborate work in the gables of the doorways, and though most of the late tracery was ugly, was a building which, from the great projection of its buttresses and the vigour of its tower windows was effective. The little church of Notre Dame de l'Epine, at Châlons, was also impressive. Nor could anyone fail to be struck with the west front of the cathedral of Rouen, with the masses of shadow in its great central doorway and beneath the arch of the west window, with the picturesque gallery above it, and with its forest of pierced gables and canopies. Though they might deplore the attempt to make architecture immaterial, they could not be blind to the knowledge, skill and daring of the architects.

The subject of the last of the Hermione Lectures was "Italian Renaissance Architecture." The interest in Renaissance architecture, Professor Aitchison said, was of an entirely different kind from that which enthralled them in Gothic. The men of the Renaissance were actuated by entirely different desires from those of the Middle Ages, and were also of most vigorous physical and intellectual powers, but were by no means so overflowing with invention, and the architects were absorbed by a new desire of giving the simplicity and dignity of Classical architecture to their own architectural works, and being mostly artists they wanted to make striking pictures of their buildings in architectural language, and they were by no means troubled with any desire for feats of construction, for they were not constructors, and had Roman authority for massiveness. They had, however, a love for beauty that has been exceeded only by the Greeks. He did not think the Italian architects ever quite equalled in their works the dignity and impressiveness of Roman buildings, though there was this to be said in favour of them, they had only a part of the revenues of a great nobleman or a great city to expend, while the Romans had a part of the plunder and taxation of the civilised

world. It was, perhaps, unfair to judge of what the Romans could do from the trifling remains that were left, but he recollected nothing of theirs that possessed that exquisiteness of some of the best early Renaissance buildings, not to speak of the semi-architectural monuments of the Renaissance. He might, however, say that for style and beauty the Renaissance still held its own and showed its visual superiority over every sort of work that had been done since the palmy days of Athens. There was a long list of architects of the fifteenth century, from Benedetto da Magano to Michel Angelo, of whom, perhaps, Peruzzi and Bramante were the greatest; but these early Renaissance men were so full of energy and capacity that they could turn their hands with success to almost anything. One had but to read the account that Leonardo da Vinci gave to Sforza of what he could do, and the life of Benvenuto Cellini to see that these men could sing you a song or make you verses, build a ship or lead an army, paint a picture, cast a statue or engrave a dye with almost equal felicity and success. There was a native vigour about their minds and an inventiveness which rendered their work more interesting to us than when the whole of Roman architecture had been measured and mapped out, as it was by the middle of the sixteenth century. Buildings could then be made by recipe, and could be criticised by their supposed exact similitude to ancient Roman work. The architecture of the fifteenth century was done by men who still retained memories of a former style and of former austerity, and had been spurred to invention by the first sight of Roman models. The Palazzo del Consiglio at Verona, attributed both to Fra Giocondo and Formentone, the communal palace at Brescia, the church of the Madonna dei Miracoli at the same town, the Scuola de St. Marco and the Palazzo Cornaro-Spinelli, and the Manzoni at Venice, and some of the more striking tombs, would do more to raise their admiration for these works than a long list of more pretentious and duller works, although Palladio's great hall at Vicenza, Peruzzi's Massimi Palace at Rome, and Michel Angelo's staircase at the Laurentian Library and his chapel to the Medici should not be omitted, nor some of the lovely works of Bramante; in fact, there was hardly a town in Italy that had not got some masterpiece of the early Renaissance, for it was the mingling of Christian truths with Pagan myths that gave it one of its charms. The lecturer gave an interesting description of the Cornaro-Spinelli Palace at Venice, which, although small, was of very artistic device, and was supposed to have been designed by one of the Lombardi, a family which had produced as many architects as that of the Du Cerceau, in France. This palace, although a jewel in itself, would, but for its artistic perfection, be almost unobserved by the side of the gigantic Palazzo Vendramini and the large palaces on the Grand Canal. There was another small but most charming palace which Browning once bought, rather later than the Palazzo Spinelli. The lecturer next said a few words on the quaint inventiveness of these early Renaissance men, and proceeding described the two palaces built by Baldassarre Peruzzi for the Marquis Massimi in the Via San Pantaleone, the great charms of which were their plainness and elegant proportions. The lecturer then dealt with the works of Palladio, who conveyed the grandeur of expression of the antique. His basilica at Vicenza was one of his most impressive works. The Italian Renaissance came about by a triple influence—patriotism, intellectual freedom and taste. Italy, torn by faction or ground under the feet of execrable tyrants, loved to see buildings that reminded her of Italy's greatness. She hated to see a style that reminded her of ecclesiastical fetters and austerity, while the cultivation so earnestly pursued for more than a century made her long for dignity, grandeur, simplicity and breadth of ecclesiastical buildings. He had dealt with the four epochs of architecture, beginning from the time of the Greeks. Each period showed the peculiar genius of the people and their progress in intellectual development. It was true he had only given a glimpse of the perfection of Greek architecture, of the dignity and magnificence of Roman, of the soaring flights of Gothic, both constructively and æsthetically, and of the greater perfection and artistic beauty of the revived Roman, but he hoped he had whetted their appetite to know more about architecture and to take more interest in that of the present day. It was from the numbers, knowledge and taste of the lovers of every art that its perfectness developed. They could not believe that if the public generally were as dead to the flights and perfection of poetry as they were to architecture they should ever have had Tennyson. Did they think painting would have flourished as it did in Italy if the painters had not recognised that love of the people for it, and had not recollected the Cimabue who made the first step forward from the old Byzantine mechanism had had his picture borne in triumph through his ward, and that it was ever afterwards called the joyous ward. They must remember that architecture alone of all the fine arts told the history of the cultivation of the people at the time it was done in its own country, while the works of every other fine art could be and were

exported. They should remember the boast of Pericles to the Athenians, "We love the beautiful." If they did not love it nowadays, how could they expect to rival those who did? He hoped that the imperfect description he had given of the great progress that had taken place in old times would have some effect in making his hearers to see for themselves the glorious beauties of continental architecture during the periods he had dealt with.

Rev. Professor Mahaffy said he had been requested by the warden of the college to express their thanks to the lecturer. They knew the eminent position he occupied in London, and it was to the credit of the college that they had been able to secure such a distinguished lecturer on this most interesting subject. When he spoke of the small appreciation in which architects were held in England as compared with other artists, he (Professor Mahaffy) could see one way of consoling him. In most of the other arts men must produce the whole work. In the case of the architect he had to depend a great deal upon others. A great deal depended on the stained-glass, the carving of pillars, as well as in other details. On the other hand, the very name he holds was a name greater than that of any other artist. As such he was entitled to stand in the highest possible place in the society of artists. They were very proud in having been able to get from London such a distinguished member of the profession, and he hoped when the lecturer came back to them he would come not as a stranger, but as an old friend. Professor Aitchison returned thanks.

MANCHESTER SOCIETY OF ARCHITECTS.

THE thirty-third annual dinner of this Society was held on the 25th ult., at the Queen's Hotel. The president of the Society (Mr. John Ely) occupied the chair, and the company included the president of the Royal Institute of British Architects (Professor Aitchison). After the loyal toasts had been honoured, the President proposed "The Royal Institute of British Architects and its President." In the next few days, he remarked, would be celebrated in London the sixtieth anniversary of the foundation of the Royal Institute of British Architects. There was a Society of Architects in 1831, and in 1834 it was fairly launched on its career; in 1836 the first meeting was held, and William IV. granted them a charter, and the Society became the Institute, and sixty years last August Her Majesty the Queen became the patron. So it came to pass that the career of the Royal Institute was contemporary with the Queen's reign. The objects from the first were of a lofty order. They desired to include the most prominent architects of the day, those who were of unimpeachable integrity, and in every way to elevate the profession, believing that in so doing they were not merely advancing their own interests, but in reality promoting the interests of the public at large. Professor Aitchison, in his reply, urged the importance of architecture as a factor in a nation's progress, and pointed out how difficult it was for architecture to advance unless the public took an interest in it. There were special difficulties in the way of the architect, for whereas the products of genius in music and in painting could be exhibited all over the world, the works of the architect could not so be treated. Unless there was some strong love for a thing, or some considerable appreciation of it, he did not see how it was possible to expect persons to devote their whole lives to it, and more especially those who had a natural genius for it. It seemed to him that the public were considerably mistaken in the view they took of architecture, and he could wish that in such a town as Manchester particularly, where there was much mental activity and whose wealth was enormous, a greater interest were taken in the profession of architecture. He trusted that greater interest would be taken in this matter, and that it was not too much to hope that in the far-off time people would come from the east and the west, as they now went to Athens and Rome and Florence, to sketch and take note of the great works of architecture found within its precincts.

Mr. A. Darbyshire proposed "Our legal friends."

His Honour Judge Parry responded in a humorous speech. He had been asking himself, he said, what there was in common between the county court and the Institute of Architects. In his court people only, as a rule, sought to collect debts under 50%, and he did not suppose any architect would care to trouble about the collection of a debt under that sum. It would not be worth his while. Then there was the bankruptcy department; he thought that might interest the architects. He therefore looked at the statistics and found that building owners—thanks to the services of the architects—were frequently becoming bankrupt. He also found that contractors—probably owing to the certificates given by the architects—were also sometimes bankrupt, but he never found an architect going to the bankruptcy court. So he had come to the conclusion that whatever the reason why he was included in the "legal friends" of the Institute of Architects, his association with the county court and the bankruptcy court had nothing to do with it.

Mr. Lord, who also responded to the toast, took occasion to say that in having such a man as Mr. Parry as judge of the county court, Manchester was the most fortunate city in the kingdom.

The remaining toasts were:—"The Allied Societies," proposed by Mr. Holden, and responded to by Mr. Willink; "The President," proposed by Mr. W. Goldthorpe, and acknowledged by Mr. Ely; and "The Honorary Secretaries," proposed by Mr. Bennett, and replied to by Mr. Hewitt.

GLASGOW PHILOSOPHICAL SOCIETY.

AT a meeting of the Architectural Section of the Glasgow Philosophical Society held on Monday night in the Society's Hall, Bath Street, Mr. F. H. Newbery, headmaster of the Glasgow School of Art, read a paper on "The Sum of Tradition." Under this heading he dealt with the heritage of art, more especially as apparent in architecture, that had been handed down to the present day. The fulness of tradition, he said, should early be made known to the student, and he be called upon to choose for himself. There were three ways of treating tradition, first, to ignore, which was impossible; second, to blindly copy, which was foolishness; and third, to rightly use, which alone was wisdom. To do this last was, in the first place, to thoroughly learn the lessons tradition taught, and what these were was gone over by the lecturer. He insisted that tradition was not a fixed quantity, and that we ourselves by our works were daily adding to it. That which was for our fathers could be for us if it were found acceptable after proof, but we were free to ignore or accept according as the artist in us dictated. After all, it was curious to observe how little matter there was that was really original. In many cases it was merely assimilated material. Many artists were original because of their wisdom as shown in assimilation. The lecturer ridiculed the idea that the teachings of tradition could be summed up in a code and then taught as laws for the guidance of the student. Those who advised such impossibilities could neither be artists nor authorities, but outsiders incapable of producing a work of art themselves, or of understanding its traditions. After treating of the part that schools should play in the treatment of tradition, and mentioning that those alone who could produce a work of art could impart a right knowledge through lectures, he concluded by hoping that in the future there would be the freest possible form of art education. The students should be hindered in nothing, and should be allowed to attempt anything. What the student might have to do in after life that he should attempt under the freest conditions while studying, for the student was from the beginning the artist, and the mature artist ever remained a student.

THE EXPORTATION OF ANTIQUITIES FROM ROME.

THE Rome correspondent of the *Times* writes under date November 26:—An important decision regarding the export duties laid on such articles of commerce as fall under the very vague and elastic heading of "antiquities" has just been rendered by the Court of Appeals in Rome. As is known to all who have attempted to purchase such articles here, the export duty of 20 per cent. levied on them by a law which is an inheritance from the Papal Government, is not only a grave charge, but one which it is sometimes embarrassing to determine, the value of such things being purely fantastic. The law, known as the *Pacca edict*, applies only to the late Papal territory, each one of the ancient realms of Italy having still its ancient regulation, the duty from Tuscany being 1 per cent., and that from the former Austrian possessions *nil*. The Roman Court has decided that it only applies to such objects as are recognised as "precious"—i.e. as of exceptional artistic or historical value. The limitation is as vague as the old definition, and perhaps the best results of the decision will be to compel the Government to pass a general and rational law, under which the possessor of an object having value from its antiquity shall be free to carry it out of Italy. Professor Villari, when Minister of Public Instruction, proposed a sensible and comprehensive law, which, while imposing a small duty and the necessity of a permission to export, for the purpose of controlling the exportation of the heirlooms of the nation, made it indispensable for the Government either to purchase or permit the exportation. This law, like most of those which the public good has called for, has ever since lain covered by the petty legislation for electoral purposes, which impedes all useful reforms other than those demanded by the constituents of the ministerial deputies. If an object is precious and indispensable to the honour or history of Italy, it is reasonable that its exportation should be prevented, but only by purchase, for it is an outrage that a man may not dispose according to his interests or necessities of articles which are his unquestionable property.

ARCHITECTURAL ASSOCIATION OF IRELAND.

ON the 23rd ult. Professor Aitchison, president of the Royal Institute of British Architects, and Professor of Architecture at the Royal Academy, delivered a lecture on "The Architecture of the Renaissance," to the members of the Architectural Association of Ireland, in the Leinster Lecture Hall, Molesworth Street. Mr. R. C. Orpen, B.A., president of the Architectural Association of Ireland, occupied the chair, and there was a large attendance, which included many members of the Royal Institute of Architects, Ireland. The lecturer, in an instructive manner, described the various epochs in the development of architecture that ultimately led to the Renaissance. The principal points of the lecture were illustrated by limelight views. Mr. C. Orr manipulated the lantern.

TESSERÆ.

Wren and Freemasonry.

ACCORDING to Lessing, the English word *masonry* should be *masonry*, for it is derived from the Anglo-Saxon word *massoney*, a secret commensal society; which last word again comes from *mase*, a table. Such table societies and computuses were very common amongst our forefathers, especially amongst the princes and knights of the Middle Ages; the weightiest affairs were there transacted, and peculiar buildings were appropriated to their use. In particular, the *masones* of the Knights Templars were highly celebrated in the thirteenth century. One of them was still subsisting in London at the end of the seventeenth century, at which period, according to Lessing, the public history of the Free-masons first commences. This society had its house of meeting near St. Paul's Cathedral, which was then rebuilding. Sir Christopher Wren, the architect, was one of its members. For thirty years, during the rebuilding of the Cathedral, he continued to frequent it. From this circumstance the people who had forgotten the true meaning of the word *massoney* took it for a society of architects with whom Sir Christopher consulted on any difficulties which arose in the progress of the work. This mistake Wren turned to account. He had formerly assisted in planning a society which should make speculative truths more useful for purposes of common life. The very converse of this idea now occurred to him, viz. the idea of a society which should raise itself from the praxis of civil life to speculation. "In the former," thought he, "would be examined all that was useful amongst the true; in this all that is true amongst the useful. How if I should make some principles of the *masonry* exoteric? How if I should disguise that which cannot be made exoteric under the hieroglyphics and symbols of *masonry*, as the people pronounce the word, and extend this masonry into a Free-masonry in which all may take a share?" In this way, according to Lessing, did Wren scheme; and in this way did Freemasonry arise. Afterwards, however, from a conversation which he had with Nicolai, it appears that Lessing had thus far changed his first opinion (as given in the "Ernst und Falk"), that he no longer supposed Sir Christopher simply to have modified a *massoney* or society of Knights Templars, which had subsisted secretly for many centuries, and to have translated their doctrines into an exoteric shape, but rather to have himself first established such a *massoney*, upon some basis of analogy with the elder *massoney*.

Patronage of Art in England.

There are two ways in which a nation can honour art—by the development of native genius and by the acquisition of works which shall kindle and inform it. In both respects England has been peculiarly hindered from running the race with other countries. And there are two different points from which the taste and demand for art may start—the one the court and the other private individuals. England began, as was natural, from the first. The fashion showed itself in the English court as early as in any other north of the Alps. Henry VIII., probably in mere emulation of his more genial brother Francis I., formed a small collection, but the taste, if he had it, was not transmitted to his children. It is true Ticozzi mentions Titian's having painted a picture, *Di Divoto Argomento*, for Queen Mary, but Elizabeth at all events had no sympathies of the sort, and it was well, as Horace Walpole says, that her successor had none either, or he would have introduced as bad a taste into the arts as he did into literature. Taught, therefore, probably by the precepts and example of the Earl of Arundel and the Duke of Buckingham—the first enlightened patrons of art in England—the two sons of James I., though of a descent—Scotch on one side, Danish on the other—little favourable to such tastes, developed an early partiality for paintings and were both enthusiastic collectors from their youth. Prince Henry, who died at the age of eighteen, had already formed an interesting cabinet. To Charles I., however, belongs the merit of having gathered

together a gallery which, as a whole, has never since been equalled in England for extent and quality. The chief contents had been accumulating for 150 years in their native soil. The family of the Gonzaga, Dukes of Mantua, were second only to the Medici in the patronage of the arts, and the purchase of the great Mantua gallery constituted the main body of Charles's irreplaceable collection. We may well say irreplaceable, since thirteen Raphaels and forty-five Titians, the one including *The Pearl*, the other *The Venus del Prado*, with numerous gems of Correggio, Giorgione, Palma Vecchio and others, can hardly be drawn together again in a single gallery even by English wealth and energy. Their spoils enrich to this day Vienna, Paris and Madrid. The restoration of the house of Stuart brought back, it is true, a portion of the dismantled gallery, but it did not bring back the taste, this had taken flight more irrevocably for the time than the pictures themselves. Hampton Court, St. James's and Windsor were again adorned, but the scale of excellence was far lower. Whitehall alone recalled in some measure its former glories, for here were deposited the pictures which the States-General had restored, together with such as Charles II. had been elsewhere able to reclaim. But a fatality worse than revolutions awaited them. The palace took fire, and Raphaels, Leonardos, Giorgiones, Titians and Holbeins perished miserably in the flames. Next ensued fresh political disturbances—the country again changed its rulers, and, as respects art, certainly not for the better. Neither Dutch nor Hanoverian sovereigns sought recreation from the toils of government in the refined company of the arts, religion disowned and luxury did not adopt them. At the beginning of the last century we might be said to be comparatively destitute of this great element of civilisation, which was neglected alike by court and nation. Foreigners came to spy out the nakedness of the land and write theories on the incompatibility of mercantile pursuits and æsthetic sympathies. Voltaire himself sneered at our apathy and denied our capacity for the fine arts, but the sneers and denials of the arch-infidel were doomed to be as false as usual. The Englishman bided his time. He had much to do before he could be ready for artistic enjoyments, and his first step, sordid as it might appear to his more elegant neighbour, was to put himself in a position to afford them. The last century, ugly and uninteresting though it may look to our present more fastidious eyes, was essentially a time of recovery. Great affectation and odious taste there was, when any taste was pretended to, as we see in many a passage alluding to the arts in the Vicar of Wakefield and other writers of that period. But the frippery lay on the surface.

Hogarth and the Foundling Hospital.

Hogarth was requested by the governors of the Foundling Hospital to design an allegory which represents several children already admitted to the institution, the boys with mathematical instruments, the girls with spinning wheels. Over the door of the building from which they are proceeding are the king's arms: a porter is bringing in a child, followed by Captain Coram, whose benevolent countenance is directed towards a kneeling woman. In the background are deserted infants variously exposed. The whole design is intended to excite public commiseration for the helpless objects of humanity. This composition was engraved by a foreign artist, F. Morellon la Cave, and printed as the head-piece to the power of attorney delivered to those ladies and gentlemen who were appointed by the trustees to receive subscriptions towards building the hospital. At that period, 1749, the infants were received at a house hired for the purpose in Hatton Garden, for such was the zeal of the ladies in particular for providing an asylum for these deserted infants, that a sufficient fund was raised for this benevolent purpose before the foundation was laid for the present spacious hospital. Hogarth's exertions in forwarding this good work were so marked that he was elected a governor of the fashionable institution at the time he painted *The March to Finchley*, which was estimated by him to be worth 300l. Its celebrity alone for a long time attracted thousands of spectators, all of whom contributed their mite to the charity. It was not, however, the original intention of Hogarth to present this picture to the hospital. The gift was owing to a fortuitous circumstance. The *etat* which followed this most interesting composition grew naturally out of a national feeling associated with its subject. It represented the march of the foot guards in the depth of winter to meet the insurrection in the north. A print was proposed to be published from this to be engraved by Luke Sullivan. This was accomplished, and a masterly effort it is of the joint talents of painting and engraving at this period of British art. It was, moreover, the precursor of all the subscription battle-pieces that have appeared since. The following announcement of this proposal may be now regarded by many as a literary curiosity:—*General Advertiser*, April 14, 1750.—"Mr. Hogarth is publishing by subscription a print representing *The March to Finchley* in the year 1746. Engraved on a copper-plate 22 inches by 17. The price 7s. 6d. Subscriptions are taken in at the Golden Head in Leicester Fields, till the 30th of this

instant and not longer, to the end that the engraving may not be retarded. *Note*.—Each print will be half a guinea after the subscription is over." By this document we perceive how simply an affair of subscription was announced in these honest days. No quackery, no puffery, no long exordium of its political or moral effects, no expatiatory remarks on its merits as a work of art. It is an open, plain announcement of a sterling seven shillings and sixpenny-worth of talent, take it or leave it. "Now is your time, my loyal customers, for, in a few days the price of the commodity will be augmented almost 50 per cent." This was a straightforward business between the painter and the public, and the affair was settled in fourteen days. How the picture became an heirloom to the Foundling Hospital arose as follows:—In the subscription-book wherein the loyal and the lovers of art inserted their names, was written a proposal, which offered each subscriber of an additional three shillings for the print a chance for the original picture, which Hogarth pledged himself should be delivered to the winner as soon as the engraving was completed. The number prescribed was two thousand, but the whole subscription was not filled, and the result was published as follows:—*General Advertiser*, May 1, 1756.—"Yesterday Mr. Hogarth's subscription was closed, 1,843 chances being subscribed for. Mr. Hogarth gave the remaining 167 chances to the Foundling Hospital. At two o'clock the box was opened, and the fortunate chance was No. 1,941 which, belonging to the said hospital, the same night Mr. Hogarth delivered the picture to the governors."

Paintings at Carlton House.

In the year 1783, George IV., then Prince of Wales, having nearly completed his twenty-first year, and having until that period resided with his royal parents at Windsor, at the Queen's Palace, or at Kew, it was thought becoming his dignity, as heir-apparent, that he should be provided with a residence and suitable establishment. Carlton House appearing an eligible site, George III. sent a message to both Houses of Parliament on the subject. That to the House of Commons was announced by Lord John Cavendish, and that to the House of Peers was presented by the Duke of Portland. In this important business the two houses concurred without a dissentient voice. The alterations at Carlton House Palace commenced in 1783, under the direction of Holland, who held until his death the appointment of architect to the Prince. It was objected by some fastidious connoisseurs that there was a deficiency of pictures of the great Italian schools in the gallery. But these objectors should have considered that the suite of domestic apartments in which treasures of art constituted the principal ornaments was not sufficiently lofty to admit of larger works, the ceilings not being 9 feet high. Indeed, from the necessity of adapting the old apartments to the modern style, this inconvenience could not be avoided. Hence scarcely any but pictures on a small scale were admissible. To this circumstance was owing the gratification of the most select display of Flemish and Dutch cabinet pictures that existed in any one gallery in Europe. The larger paintings, with the exception of a few portraits of the royal family, were distributed on the walls of the state apartments, which occupied the floor above, wherein the ceilings were sufficiently lofty. In these were disposed four pictures by Reynolds—*The Death of Dido*, *Count La Lippe*, *Iphigenia*, and the commanding figure of the *Marquis of Granby*. It is said that the hint for the last was derived from a woodcut, which Sir Joshua accidentally obtained as a head-piece to a penny pamphlet. This may readily be credited, as a mind like his could discover, in the slightest accidental sketch, that combination of forms upon which so great a work might be constructed. This hero of the House of Rutland—in popularity another Wellington—was personified by the pencil of the greatest and the least in art. The "Granby's Head" was a common sign, and innumerable graphic subjects, high and low, contributed to his fame. It is a remarkable, indeed an unaccountable fact, that George III., who was an acknowledged connoisseur, should not have patronised Sir Joshua Reynolds, indubitably the greatest English portrait painter; for, excepting the two magnificent portraits of the king and his consort in their coronation robes, which were painted for the council-room of the Royal Academy, Reynolds was never honoured with any commission by these august personages. The two whole-lengths of their majesties, which formed part of the collection in the lower suite of apartments in Carlton House Palace, were the work of Allan Ramsay, a painter no more to be compared to Reynolds than he to Jupiter. West, Zoffany, Gainsborough, his nephew Du Pont, Copley, Coates and Sir William Beechey principally divided the royal patronage in the portrait department. George IV., however, justly appreciated the talent of this illustrious artist. In Carlton House Palace were several of his finest works. The celebrated whole-length of the Duke d'Orleans, a specimen of his extraordinary powers as a colourist; the Duke of Cumberland, no less exquisitely wrought; and also the Duke of Cumberland, of Culloden fame, were in the entrance-chamber to the state apartments, the last two in

the robes of the Garter. In the great crimson drawing-room was a portrait, half-length, of Lord Erskine, then in his zenith of fame, which was painted expressly for George IV. These, with the *Count La Lippe*, the *Dido*, the *Iphigenia*, some of which adorned the same apartment, were evidences of the king's taste for the works of the great master of our native school.

Mediæval Art.

Self-adaptive and comprehensive, Gothic architecture dealt with equal good fortune with themes most diverse in their character and demands: for it, the cathedral was not too vast, the memorial cross too pathetic, the mansion too much broken in detail or merely domestic in its uses, the bridge too utilitarian or the dove-cote too small. From cradles to tombs this art-science, for such it was, could supply the wants of men wherever men were found capable of applying it. A woman's girdle or a woman's robe, the crozier of an archbishop or his gorgeous vestment, were alike fit subjects for it. With all this freedom and scope, in dealing with which it was the sole rival of equally glorious and beautiful Greek art, Gothic design kept, each in its province, the elements of those arts which, in its great system, were subordinated. In its chief works—those architectural—the skill of the painter, glass-stainer, mosaicist and sculptor lent their powers to one end, the glorification of architecture. Restrained thus far, the wall-painter confined himself to his office; he produced decorations, not paintings, in the modern sense, and in forms that the law made conventional did not lose sight of the artist's highest aims. The glass-stainer, with a distinct idea of his duty to make an integral portion of a building, did not attempt to reach that development of painting, *per se*, at which he has, with means far inferior, since foolishly aimed. A stained-glass window was not proposed to be a mere transparency, ridiculous with diaphanous figures of animals, trees and men, but a gorgeous space of dyes, a mosaic made, by the aid of light itself, ten times more brilliant than petrous mosaic could be. The mosaicist spread splendour upon the whole wall-space where splendour was required, fired by his golden grounds the vaultings, and lit up dim spaces with light that followed day; servant and not intruder, of old he knew the limits of his power, and even when painting rose above architecture, honestly plumed himself, not upon imitating painting, but upon producing that which painting could not produce.

Canova's "Theseus."

When the group which had so long formed the subject of Canova's secret solicitude and unwitnessed labour was finished, in order to give full effect to the surprise and *éclat* of its first exhibition an entertainment was given by the Venetian ambassador to the most celebrated artists, men of letters and other distinguished characters then in Rome. No previous intimation of a work thus carefully concealed had yet transpired; a model of the head of his victorious hero, purposely prepared by the artist, and placed in the apartments destined for the reception of the guests, was the first announcement of the new production. This beautiful and novel object, in such an assembly, naturally attracted universal attention; and the whole company by degrees had collected around it. Various were the opinions on its forms, its expression, its subject, and keen were the disputes to which it gave rise. All were agreed that the cast must have been taken from a work of Grecian sculpture and of great merit, but they were divided on what it represented, and where the original was to be found. Some affirmed that they had seen it in such a collection, some said it was in a different gallery, part maintained that such a personage of antiquity was portrayed, others asserted a contrary statement, in short, the acknowledged beauty of the piece was the only common sentiment which experienced no opposition. Seizing the proper occasion, when he perceived everyone to be thus deeply interested in the affair, "Ebbene," said the ambassador, "andiamo a vederne l'originale;"—"Come, let us terminate these disputes by going to see the original." All were astonished. What, the antique, about which so many conjectures had just been made, in the possession of their host! It seemed hardly credible, and they eagerly followed to where Canova's "Theseus," victorious over his cruel foe, in all the brightness of recent finish, and placed to the best advantage, was disclosed to view. The effects produced by this unexpected sight it is impossible to describe. Every feeling was absorbed in surprise, delight and admiration. The work was universally pronounced to be one of the most perfect which Rome had beheld for ages; and artists who afterwards pursued the sculptor with the envious malice of inferiority were now silent, or hurried away by the unrestrained enthusiasm of the moment. "To the end of life (in fine della memoria)," said one of his friends, "Canova retained a fearful recollection of his feelings at this time, and was often heard to say that death itself could not be more terrible than the mental sufferings which he endured while the earlier of these occurrences were passing."

Freemasons' Hall, Great Queen Street.

As Inigo Jones designed some buildings in Lincoln's Inn Fields and in the neighbouring Great Queen Street, it was customary to describe Freemasons' Hall as one of his works. Prior to the alterations made from time to time during the last half century, it presented an appearance that gave plausibility to the statement. It, however, belonged to much more modern date than the period of Inigo Jones. Both the hall and the tavern were erected from the designs of Thomas Sandby, R.A., professor of architecture in the Royal Academy, whose annual lectures at Somerset House on that science were the admiration of the artists and others who attended them for thirty years. Sandby was grand architect in the Grand Lodge of England. The hall was built by subscription, and a large silver medal was struck in the year 1780, and presented to the subscribers to commemorate its erection, and bears the following inscription round it:—"Grand Lodge of Freemasons in England;" on the face of it:—"To Thomas Sandby, G.A., in grateful testimony of a liberal subscription towards completing their Hall." All the ornaments in the friezes, ceilings, windows, &c., were cast in plaster of Paris by Cox from original models, designs of masonic emblems invented and disposed by Thomas Sandby, solely for the appropriate decorations in the hall, and now existing nowhere else. The moulds were deposited in Sandby's house in Windsor Great Park, of which he was deputy ranger, where they went to decay without a duplicate copy remaining.

The Cripplegate Fire.

SIR,—If the roofs of the warehouses had been covered with copper the fire would have been arrested at the beginning, as no flames could have escaped through the roofs. Coverings of zinc blaze in a strong heat as easily as wood, and lead immediately melts and runs down in a stream to the great danger of firemen. Copper does not melt even in a very strong heat, and instances are on record of copper roofs remaining intact after the interior has been completely burnt away. To secure this desirable result it is of course necessary that the copper sheets should be welded together. If the sheets are laid separately with loose roll caps, as is too often the case, then the separate sheets might crawl up with the heat; but if the caps are welded on, so that the roof is practically one sheet of copper, then as long as any supports remain the house, even if completely gutted, has a fireproof covering through which no flames can escape.

In the very important inquiries now being conducted as to how to render buildings in London fireproof, this surely is a consideration that should not be lost sight of.—Your obedient servants,

EWART & SON.

346, 348 and 350 Euston Road, London, N.W.:

November 27, 1897.

Shoddy v. Fireproof Construction of Buildings.

SIR,—Since the recent great fire in Cripplegate the papers have been replete with sensational descriptions and censorious correspondence condemning the said inefficiency of our fire brigades, and their alleged obsolete extinguishing appliances, also the erection of high buildings in narrow streets, &c., whilst the unnecessary employment of combustible materials for their interior construction appears to have been ignored.

As the wisdom of the adage, "Prevention is better than cure," is generally admitted, this oversight seems remarkable. It is an undisputed fact that a vast quantity of inflammable material is still unnecessarily used in the construction of most (even modern) buildings; indeed, many seem veritably designed to catch fire and get burned out.

Everywhere around us we see evidence of this deplorably cheap and conservative practice, in the dangerous forms of wooden roofing, flooring boards and joists, staircases and landings, stud and lath partitions, matchboard ceilings and linings and divisional compartments, &c., lead gaspipes, &c., when an additional outlay on the structure of not more than 10 per cent. could insure the employment of fire-resisting materials throughout, which would render the building practically fireproof.

With our present system of "jerry" building it is wonderful that greater loss of valuable lives and property does not occur than is the case.

As there are numerous approved and tested fireproof constructions and fittings on the market, it seems high time that legislation should be brought to bear to prohibit the use of unnecessary inflammable material in buildings. At length a "Fire Prevention Committee" has just been inaugurated in our Metropolis, with the view, among other laudable aims, of

pressing for some such reforms with reference to building construction. Of late the authorities have awakened to the fact that priceless treasures are still stored in some of our museums of the combustible nature at issue, and a select committee has recently reported to Parliament on the subject, but as yet I believe no decision as to the amelioration of this risky state of affairs has been arrived at. The dearth of papers which have been read before our learned and technical societies and institutions on the matter is rather remarkable. I understand, however, that one is shortly to be read on the subject before the Society of Arts.

From 1853 till 1891, I am informed, not a single paper on the topic in point was presented or read before the Institution of Civil Engineers, and I know of no other since that date. In this respect we seem to be behind many other nations, as also with regard to fireproofing tests and experiments.—Yours truly,

London: December 1, 1897.

J. B. SMITH.

GENERAL.

The Design of MM. Auburtin and Umbdenstock has been adopted for the building in the Paris International Exhibition which will be used for objects belonging to the Army and Navy. The prize of 2,000 francs was awarded to M. Bertone, and M. Bréasson obtained the prize of 1,000 francs.

Mr. F. Punchard will read a paper on Monday next, at the meeting of the Surveyors' Institution, on "The Royal Commissioners' suggested amendments to the Agricultural Holdings Act, 1883."

The Society of the Inner Temple have given notice of an intended application to Parliament next session for an Act to modify and amend section 28 of the Thames Embankment Act, 1862, and to authorise the Society to erect and maintain buildings upon so much of the reclaimed land belonging to them as lies between the southern extremity of the buildings proposed to be erected in extension of King's Bench Walk and the northern side of the tunnel of the Metropolitan District Railway.

The Swiss Archaeological Society, in the course of the excavations at Windisch, the old Roman colony of Vindonissa, in the canton of Argovie, have discovered large Roman villas and an amphitheatre, besides a large quantity of coins, pottery, bronze, ironware, and some large silver vessels which are said to only have their equals in the famous treasure-trove of Hildesheim, in Germany, brought to light in 1868.

The National Sculpture Society of New York will exhibit next year a comprehensive collection of photographs and other illustrations of sculpture and sculptured monuments in America.

The Third Ordinary Meeting of the Liverpool Architectural Society will be held at the Law Library, Union Court, on Monday, December 6, when a paper will be read by Mr. J. A. Gotch, F.R.I.B.A., on "The Domestic Architecture of the Renaissance: Elizabeth — James," illustrated by limelight views.

Mr. Henry Clarke, a member of the Corporation of London, having expressed a desire to contribute a painting to the value of 1,000 guineas, commemorative of the Queen's visit to the City, for the art gallery at the Guildhall, the commission has been entrusted to Mr. A. C. Gow, R.A. The picture will represent the Jubilee Service outside St. Paul's Cathedral, and will include the whole of the façade of the cathedral and the personages assembled there. Her Majesty will of course be the central figure. The work will not be completed until 1899, when it will be included in the exhibition of the Royal Academy.

Messrs. Ashley & Armstrong, of Berners Street, W., have been awarded the first premium of 26*l.* 5*s.* in the competition for the Village Hall, Byfleet.

Mr. William Goldstraw was on Wednesday appointed building surveyor to the City Council, Liverpool, at a salary of 450*l.* a year.

The New Building erected in connection with the Royal Sick Children's Hospital in West Graham Street, Glasgow, for the accommodation of sisters and nurses, was formally opened on the 26th ult. The building includes bedrooms for six nurses and two sisters, sitting-room, dining-room and other accommodation, in addition to a lecture and demonstration-room and administrative offices. The new building will give much-needed relief to the main hospital in Scott Street. The cost of the work is about 3,000*l.*

Recent Excavations at Windisch, the old Roman colony of Vindonissa, in the canton of Argovie, have yielded important results. Large Roman villas and an amphitheatre have been discovered, and, besides a large quantity of coins, pottery, bronze and ironware, some large silver vessels have been discovered, which are said to only have their equals in the famous treasure-trove of Hildesheim, in Germany.

The Architect.

THE WEEK.

AT the opening of the new Academic Hall with which Mr. M'EWAN has enriched the University of Edinburgh, the tribute due to the architect, Dr. ROWAND ANDERSON, was not left unpaid. Sir WILLIAM TURNER, one of the professors, in the course of his speech said:—"We have but to look around to satisfy ourselves that the University now possesses a Hall of splendid magnificence, worthy of the genius of the architect and of the constructive skill of those who have been employed to give effective expression to his design. It is graced by the art of the painter and sculptor; our ceremonies will also be enlivened by the strains of the most noble of all instruments of music, and nothing has been left undone to give to it the form, proportion and colour which in their combination may well entitle us to call it beautiful." The applause with which the words of Sir WILLIAM TURNER were received testified to the appreciation of the building by those who were fortunate to witness the opening ceremony. Dr. ANDERSON has ably served the generous donor, for the Hall is an enduring memorial of which any citizen of Edinburgh might well be proud.

THE late Mr. W. S. CROSS, who died on the 1st inst., was one of the oldest members of the Surveyors' Institution, having joined as a Fellow in the year 1873. He was in his seventy-fourth year. Mr. CROSS was for some years surveyor to the Sun Fire Office, and subsequently acted for the Duke of BEDFORD'S London estates. He enjoyed a large practice as an architect. Among his public buildings may be mentioned the Strand Union Workhouse, Edmonton; Camberwell Infirmary, Casual Wards and Receiving Workhouse, Bear Yard, W.C., besides numerous private residences, warehouses, &c. As a rating surveyor he acted for the Strand Union, St. George's Union and various other parishes and vestries, and was engaged in most of the large rating appeals. The business will be continued at the same address by his son, Mr. W. T. A. CROSS, in partnership with Mr. A. A. KEKWICK (who was associated with the late Mr. CROSS for over twenty years), under the name of W. S. CROSS & KEKWICK.

THE presidential address of the new Society of Designers was delivered on Tuesday by Mr. G. C. HAIRÉ. Three lectures will be delivered during the session. On January 25 Mr. T. R. SPENCE will read a paper on "The Element of Design in Painting," Mr. S. W. PROVERB will read one on "Design for Wall-Papers" on March 8, and on May 3 Mr. EDWIN FOLEY another on "Design for Furniture and other Woodwork." The offices of the Society are in Clifford's Inn. Mr. J. SCARRATT RIGBY is honorary secretary.

ACCORDING to a statement distributed among the congregation at the Bicentenary Service in St. Paul's Cathedral on the 2nd inst., the following works have been completed by the decoration committee:—(1) Removal of organ screen; (2) organ moved, enlarged and improved; (3) choir stalls moved from east to west side of choir; (4) eight mosaics in the dome (SALVIATI); (5) marble reredos; (6) Bishop's throne in sanctuary; (7) eight statues in dome; (8) mosaics in roof of choir, mosaics in spandrels of choir, mosaics in panels behind choir, mosaics in panels on north and south sides of choir; (9) six painted glass windows in apse, six painted glass windows in choir; (10) arches of north side of choir cleaned, gilded and touched with colour; (11) eight pilasters in choir covered with marble. The works in course of construction are:—(1) Mosaics in the four quarter-domes under the dome; (2) decorating the stonework at the sides; (3) ornamenting the interiors of the upper storeys above the quarter-domes; (4) painted glass windows in north and south transepts (Duke of WESTMINSTER); (5) painted window at end of north aisle of choir (Countess Dowager of CARNARVON). The

works wanted immediately are:—(1) Mosaics in six saucer-domes in north and south aisles of choir (three on each side), at 1,000£ each; (2) mosaics round the drum of the dome above the whispering gallery, cost 10,000£; (3) mosaics in the saucer-domes in transepts and nave, cost about 1,500£ each; (4) mosaics in the panels of the choir aisles, &c. Then will follow the completion of the decoration in the nave, transepts and aisles of choir, nave and transepts. WREN regarded the construction of the fabric of St. Paul's as an incomplete design. He intended to fill the dome and the roof of choir, nave, transepts and aisles with mosaics. He left brick vaulting, covered with plaster, for the purpose, with holes to suspend the necessary scaffolds. His scheme was cut short by the building committee. The cathedral had cost 1,500,000£, and the committee had sat for more than thirty-seven years. They would undertake nothing more.

It was stated at the Congress of Archaeological Societies that Mr. W. H. RICHARDSON, F.S.A., had prepared a preliminary list of effigies in parish churches, and it was thought that with the assistance of this list steps could now be taken to form a catalogue. Accordingly it was resolved to recommend to the committee to include in their lists effigies of all dates, all busts and portrait medallions, but not incised slabs nor brasses. It was suggested that particulars of incised slabs might be invited for a future catalogue. It was also recommended that notes of repairs to the effigies should be asked for, and notes of the original position and location, so that these might be placed on record. A resolution was passed to the effect that a memorandum be sent to the various local archaeological societies, suggesting the desirability of placing themselves in communication with the Ordnance Survey officers for their districts, so as to promote the record on the survey of the earthworks within their districts, and where possible to determine their age by excavations. It was also agreed that a memorandum should be drawn up calling the attention of the county councils to the extreme importance of promoting the safe keeping of such ancient documents as come into the custody of the parish councils. Many corporations have not only carefully calendared all the old documents in their possession, but in some cases have printed, or are printing, the results. The attention thus given to the matter has brought to light many ancient documents the existence of which was unsuspected. Inquiries should also be made for any old maces, staves, seals and other badges of office not now in use that may be in existence, so that they may be carefully preserved. The councils of the various county archaeological societies will no doubt be glad to render any assistance required in their districts, and in default of the existence of such a society in any particular district the standing committee of the Congress will be glad to give advice on the matter. Mr. RALPH NEVILL, architect, is honorary secretary of the Congress.

AN inquest was held recently in Dublin which revealed the necessity for a more rigorous superintendence of builders' work than exists in that city. Two labourers were killed by the fall of a wall in a house that stood at the corner of Cope Street and Anglesea Street, and which was about to be rebuilt. The men were removing a chimney-breast, and while shifting the bricks in the cellar the whole wall suddenly collapsed, and the two men were buried in the ruins. When taken out they were dead. Mr. BEARDWOOD, the architect, in his evidence said that when the adjoining house was built the wall was cut into, and the whole of the bond work was destroyed in consequence. There were five piers formed, and there was no doubt that the wall was weakened or disintegrated by the insertion of the piers. A trespass of that kind should not be tolerated, but in building regulations, as in other matters, there is a good deal of laxity in Dublin. Apparently there was no agreement between the owners on the subject. The jury found that the men were accidentally killed, and expressed the opinion that the wall should have been shored up before the chimney-breast was removed.

SCOTTISH ECCLESIASTICAL
ARCHITECTURE.*

IN this third and concluding volume of their comprehensive work, in which descriptions and illustrations will be found of all the remains of churches in Scotland, the authors treat mainly of the Last Pointed period. Independence was beginning to assert itself more definitely in architecture. During the fifteenth century there was some kind of organisation which secured more or less correspondence in the churches of western Europe, but occasionally amidst Third Pointed characteristics we see a nearer approach to a Scottish type than was witnessed in the preceding centuries. As was common in the North, it is in the abbeys and collegiate churches we must seek the more elaborate examples rather than in the parish churches. Although a crisis in ecclesiastical affairs was nigh, the Third Pointed period presents few indications of decay among priories or chapels. It is also possible, without any sacrifice of time or principle, to include some examples of work in cathedrals in the third volume.

Iona recalls primitive times, but the church did not attain the rank of a cathedral until 1507. The authors believe that "the choir, south aisle and sacristy are all of a late period, probably about 1500; the entire building bears evidence of having been in whole or part re-erected about the end of the fifteenth century or the beginning of the sixteenth century." The influence of early work is seen in the ornament. In 1561 the Act was passed for "demolishing all the abbeys of monks and friars," and the islanders were as eager to show their respect for the new edict as any of the townsfolk of the mainland. In Dunkeld Cathedral works were also executed up to nearly the end of the fifteenth century. An effort was made to confine the reform of the building to "all kinds of monuments of idolatry," and it was enjoined that the desks, windows, doors, glass and iron were to be preserved unharmed, but the building as well as its contents were doomed by the people. St. Machar's Cathedral in Aberdeen was fortunate in having a succession of prelates who were enthusiasts for building. The nave and western towers were the work of Bishop HENRY LEIGHTON, and date between 1420 and 1422. His successor roofed the building, and it was covered with lead and ceiled about 1518-31. But the late as well as the early work succumbed to those whom ORME designates "sacrilegious church robbers" in 1560. Paisley Abbey was in course of restoration when the order was given for its "purging." The third volume of Messrs. MACGIBBON & ROSS's work treats therefore of destruction on a great scale as well as of construction.

The Reformation could hardly be accomplished without some effect on church buildings. If JOHN KNOX was an iconoclast he was not a vandal, and he was too much of a statesman to advocate the wanton destruction of substantial churches which could be utilised for the services he was eager to introduce. He was, moreover, too confident in his power to suppose that old associations would be revived by worshipping in the old buildings, and Scotland at the time was not rich enough to erect new churches in every parish in order to gratify the desire to start afresh in all things. KNOX no doubt desired to see monasteries and nunneries cleared away, for in his eyes they were the nests of vultures; but once the agents of destruction were let loose, he was not strong enough to restrain them when they were indifferent to his commands. Hence we read in the volume we have under consideration how St. John's Church, Perth, where JOHN KNOX preached, "has the unenviable notoriety of having been the centre whence issued, in 1559, the unruly mob who in a short time demolished the splendid monasteries and other numerous religious houses of Perth and the neighbourhood, and whose example was only too readily followed by other communities throughout the whole country." But the church did not suffer except by the removal of objects which were offensive to KNOX. It was converted into three places of worship for the Reformers. In other towns where KNOX was not present to save them the buildings were considered to be almost as dangerous as the images or pictures. After the first excitement of vengeance a time of

indifference followed, which was no less unfortunate for the buildings. We read, for instance, how in 1606 the Presbytery of St. Mungo's Church, Borthwick, declined to "stent" themselves for the repair of the building, and offered to sell the vestry as a family burial-place to anyone who gave enough money to pay for the repairs of the choir. Similar cases were not uncommon.

The most remarkable building described in the third volume is the collegiate church of Rosslyn, which dates from the beginning of the fifteenth century. It is one of those Gothic buildings in which the carvers were beyond the control of the architect, and, as was to be expected, made their own work preponderate. The majority of visitors consider the church to be the most perfect example of Gothic in the North, for romance has added to its attractions. According to the old tradition, WILLIAM ST. CLAIR, the founder, "brought artificers from other regions and forraigne kingdomes" to erect it, and FERGUSON does not hesitate to say "there is no detail or ornament in the whole building which may not be traced back to Burgos or Belem." Wherever the artificers came from, their work must have cost a large sum, and yet, according to Sir WALTER SCOTT, the ST. CLAIRS, whose titles would have wearied a herald, were never so wealthy as an English yeoman. How were they able to pay for so excessive a quantity of sculpture? That is a question which often arises in connection with Mediæval architecture, and to which an answer is not readily forthcoming. Rosslyn Chapel, from the excess of its ornamentation, is commonly accepted as an unique work, but it can be demonstrated that it has much in common with other northern buildings. Glasgow Cathedral is one of them:—

The leading principles of the design are really Scottish, and it will be found on careful analysis that Rosslyn Church presents a rich and finished epitome, both as regards constructive and decorative elements, of the Scottish ecclesiastical architecture of the Third or Late Pointed period. The plan of the east end of Rosslyn Church so closely resembles that of the choir of Glasgow Cathedral that there is hardly room to doubt that the latter was the model after which the former was designed. The disposition of the pillars in the two buildings agrees exactly, the side aisles in both being connected by an eastern aisle, which in each case has a central pillar in the east arcade, and in each edifice a series of chapels beyond this aisle forms the east end. The details, as is natural, seeing that the buildings are about two centuries apart in date, are entirely different, but it is curious to observe how in both cases even the minute parts of the design are remarkably alike. Thus the triple niche over the central pillar of the east arcade at Glasgow finds a counterpart in the same position at Rosslyn. The east wall and gable of both choirs occupy the same relative position, rising above the eastern aisle and chapels. Churches with an eastern aisle are not unknown in England, such as Abbey Dore, Herefordshire, and Romsey Abbey, Hampshire; but the former has three openings in the east end, thus showing an arch in the centre; while Romsey Church, Glasgow Cathedral and Rosslyn Church have the peculiarity of having a pillar in the centre of the east arcade.

Rosslyn as a fifteenth-century work indicates the dexterity which was to be found in Scotland, and if rigorously controlled it would have produced more beautiful works than the collegiate chapel. In many of the churches which are illustrated in the volume we find skilful examples of scientific stone-cutting, showing a desire to conquer difficulties for the sake of exercising power. But when church work in which a love of art was displayed ceased to be considered meritorious, constructive and artistic skill became of little account, and therefore a part of the price which had to be paid for the Reformation was a suspension of architectural progress.

Nevertheless, unless we are mistaken, there were more churches erected to suit the reformed ritual in Scotland than in England during the sixteenth and seventeenth centuries. As there were, however, two parties, Episcopalians and Presbyterians, who held different theories about what constituted a reformed ritual, there could not be evolved any national plan of church architecture. As the authors remark:—"During the century which followed the Reformation there were two styles of ecclesiastical structures erected in the country, one style showing some reverence for the house of God in its form and decoration, and in the appropriateness of the Divine service; while the other seemed to be designed, both in its buildings and forms of

* *The Ecclesiastical Architecture of Scotland from the Earliest Christian Times to the Seventeenth Century.* By David Macgibbon and Thomas Ross. Vol. iii. Edinburgh: David Douglas.

worship, to be as far removed as possible from any outward or visible sign of inward sweetness or grace." The remarkable phenomenon is consequently presented in the authors' work that the close of it has a correspondence with the beginning, for in both parts we find buildings so simple as hardly to deserve the designation of works of architecture. Occasionally there are interesting features, such as the tower at Anstruther Wester, a Renaissance window at Ballingry, various bell-cots, the west window of Michael Kirk, Ogstoun; the Tron steeple, Glasgow; the painted ceiling of armorial bearings in Grandtully Chapel, the gateway of Turriff churchyard, &c. There are some curious monuments, foreign as well as native.

For memorials of themselves the old families were willing to be liberal in expenditure. But for a long period after the Reformation there were no wealthy townsmen, and they are the main support of church-building in Scotland. Hence it was as the authors' say:—"Most of the churches of the seventeenth century are either very poor imitations of Gothic work or tasteless examples of plain walls, while a few contain the germs of what might have been wrought into a picturesque style founded on the Domestic architecture of the period."

According to SHAKESPEARE, "Never anything can be amiss when simpleness and duty tender it," and the plainness of the Scottish temples should be taken as evidence of the utmost reverence among the worshippers. Architecture must succumb to a higher power when occasion requires, and if properly considered the unadorned kirks of Scotland have an interest which compensates for the absence of beauty within or without. It may be well to point out that there is another theory of the origin of the severity of the churches in Scotland. It was expressed by DE QUINCEY as follows:—"Strange, indeed, that the Scottish Church should have been the favourite Church of the poor, which began so undeniably upon the incitement of the rich. They, the rich and the aristocratic, had revelled in the spoils of the monastic orders at the dissolution of the Romish Church. Naturally unwilling to resign their booty, they promoted a Church built upon a principle of poverty and humility; a Church that would not seek to resume her plundered property." According to DE QUINCEY's theory the simplicity exhibited in church buildings throughout Scotland arose from the penury of the landowners. But it can be said, in reply that the rich and the aristocratic in England were liable to a similar temptation, and possessed at least similar power over their tenants, but were unable to create a Church resembling Scotland's. The northern proprietors could not have succeeded unless there was a desire to see the externals of religion expressed in a more simple form than was adopted prior to the Reformation.

That in the North there has been a change of disposition, and neither ministers nor laymen are so much afraid as were their predecessors of the dangers to their faith which can arise through the agency of architecture, is most creditable to the reasoning powers of Scotsmen. They have emancipated themselves from fallacies, and when we consider what principles were involved that was no easy task. There are places where a finial of a cruciform shape is still supposed to be an allurements to heresy, but anyone who will compare the modern Presbyterian churches in Scottish towns with those which figure in the latter part of the work of Messrs. MACGIBBON & ROSS, will have to admit that in no country in the world has there been a more marked victory over prejudices against architecture. It is not merely an improvement in taste which is displayed, but likewise the adoption of an exegesis which is inspired by consideration for human needs and human weakness in what may be a degenerate age.

The 1,600 illustrations which are found in the three volumes of "The Ecclesiastical Architecture of Scotland" form therefore a series which has interest for others besides students of architecture. They exemplify the changes of religious thought in the North, as well as many political and social changes. The greater number of the subjects are similar to the churches in England, but the seventeenth-century churches of Scotland can be claimed to be her own. The early Christians could not build except in a rude way, while their reformed successors, although competent builders, as is evident from their

domestic works, were afraid to display their skill when a church was to be erected. Thus it happened that the circle was completed and extremes met in Scottish ecclesiastical architecture.

Messrs. MACGIBBON & ROSS have not treated their subject as if they were controlled by a restricted professionalism. The volumes are not to be taken as supplying subjects for imitation in modern building. Much in them is inspiring, especially for those who wish to see a national style, but the work appeals to a wider circle than architects, builders and patrons. It therefore deserves to have a place on the shelves of every library belonging to Scotsmen at home or abroad who wish to preserve records of the history of their country.

ELECTRIC CURRENTS AND BUILDING MATERIALS.

THE report of the special committee of the American Institute of Architects appointed to consider this subject, which was presented by Mr. JAMES B. COOK to the Convention at Detroit, which we published a few weeks ago, contains many statements which are novel, if correct, and which we venture to think are incorrect. It appears that there is a standing committee to investigate, not by experiment, but to theorise generally upon subjects which we should think are rather beyond them; and if, as it is stated, this is only the first of a series of such reports, we may expect some very remarkable things later.

The report starts by giving an introduction to "phenomena of electricity," and apologises for "wandering somewhat remotely from the text." We should have thought an apology was also needed for wandering from subjects known to them into the unknown, and for giving the results of their wanderings as facts. The first half of the report devoted to the subject consists of a consideration of the atomic theory, the universe, the ether, the atmosphere, light, heat and almost everything imaginable which does not practically concern the subject.

We would suggest to our readers that the matter dealt with is one which needs experiment to make it of any value, not a result of a string of hypothetical theories which may or may not be true strung together by a committee. The committee also predict the results of experiments, "and when well investigated will prove to be a very destructive agent, particularly on iron or steel." We would suggest that a committee of architects without other aid are hardly the proper authority to bring up a report on a subject like this.

In the first "wandering" part are the following:—"The earth is but an atom of the whole universe. We find it has an envelope . . . extending up 45 miles." We would ask has such an extent of space been explored?

Again, "Investigation tells us that there is an atmospheric envelope to all planets and stars, but the kind of atmosphere is unknown." This is surely news, but we did not think that all the planets and stars had been investigated.

"The transmission of light, heat, electricity and sound is due to this ether medium." The committee are totally wrong when they state that sound is transmitted by the ether. It has, of course, been known for a long time that the whole theory of acoustics depends upon the fact that sound-waves are the compression and rarefaction of a material medium, such as the atmosphere, and the results of experiments have proved this. Can the committee explain why sound is not transmitted through a vacuum, as they rightly assume that the ether is existent in a vacuum?

We will not go further into the committee's "theory" with which we are at variance, although it contains some truths, from which, however, erroneous conclusions are drawn. One of the conclusions is that:—"In regard to the application of what has been said to the introduction of electricity into buildings, the question naturally arises, Has it any harmful effect upon the materials in the construction? We answer, if our theory is correct, Yes, for by induction in all the materials electric excitation is set up, thereby lessening the cohesive force of the atoms of the materials, and thereby in course of time disintegration takes place. The greater the conductivity of the material, such as iron or steel, the quicker the process, and the less the

conductibility the slower the process, such as all vitrified matter." Now this conclusion is perfectly new. No difference in the cohesive force of molecules or atoms has, to our knowledge, been detected except when a change of state, supplied by heat, has taken place. A copper wire is just as strong while carrying electricity as when not doing so, and an electrified body is as strong as an unelectrified one. Further, if this statement were true, the atoms would separate on disintegration, but the utmost that has ever been known to occur by the application of electricity in any form is a weakening of material due to its temperature being raised by the heat generated; this phenomenon is, with a given current, more marked as the conductivity of the material decreases, which is the opposite of the committee's conclusion. Energy has never escaped from a steady current by means of induction. When electrolysis occurs, the effect is a purely chemical one, and no disintegration occurs, only a change from a metallic condition to a more complicated condition of a metallic salt. The electric current merely allows the chemical action to go on. Induction does occur in adjacent metal if the wires carrying the current are far apart. This induction sets up eddy currents in the metal, which, however, are at too low a pressure to cause electrolysis.

A further point is that the report states, "Passing wires through metal conduits increases the induction," and that "a vitrified covering seems to offer the best protection as to induction." These statements are known to be absolutely incorrect. The true facts are that a metal pipe or a vitrified covering has no effect in resisting induction; the only way to confine the induction into a given space is to enclose it in a magnetic material. This is the only shield to induction. Thus, if the metal pipe is of iron the conclusion the committee draw is the exact opposite of that found by experiment. Further, no harm has ever been known to result from induction. Leakage of electricity has caused harm, not by induction, but by electrolysis. This leakage is best prevented by good insulation, and by enclosing both wires in a continuous earthed sheathing of metal—the very method the committee condemn.

There is one good recommendation in the report, which we gladly seize upon, and that is that all metal-work should be connected together and finally earthed. This is an excellent remedy for the effects of electrolysis due to a conductor becoming uninsulated, and also an excellent device for the protection of the building from lightning. Unfortunately the reason given is such that the credit of the suggestion must be taken away. The reason is given as follows:—"By this means we think the vibratory forces will, at least, be reduced to a minimum." The committee invite investigations on the subject, and hope to confirm their opinions by these. Fortunately the investigations have already been carried out, and the results go entirely to disprove the recommendations in this report.

We conclude by saying that a little knowledge is, indeed, dangerous. We feel certain that architects will continue to recommend electricity as an illuminant on the established grounds of safety, convenience, and from the artistic point of view, notwithstanding this report, and would add that the vibratory force of a gas explosion has in it more potential harm than the "electric conditions destroying cohesion, and producing as an ultimate result disintegration and the dissolution of all things," as explained by the committee.

GLASGOW ECCLESIOLOGICAL SOCIETY.

THIS Society met in the hall of Woodside parish church on the 2nd inst., the Rev. D. Watson, of Woodside Church, in the chair. A paper was read by Mr. William J. Anderson, architect, on "Churches of Brunelleschi and the Early Florentine Renaissance." The lecturer discussed the historic and scientific value of a retrospective view of architecture in so far as we could reconstruct the life from the husk, the soul from the mummy-case, but declared that not all the king's men could make the dry bones of a phase of art live again in an atmosphere uncongenial. Architecture must first serve a great utilitarian purpose, definite and necessary to the time, and often to the time alone. By economic laws it adjusts itself to this purpose, and perfects itself in so doing. Its opportunities of artistic expression are limited by its scope and by all the surrounding conditions. But the world's evolution is so slow or irregular in movement that the house which has served as the dwelling-

place of one generation has served for its successors and may even be reoccupied by a life separated even by a thousand years. Two instances of this hermit-crab principle are conspicuous in the history of Europe. The first when the home which the Roman emperors prepared was believed to be the appropriate residence of the Catholic world of the Renaissance, and the second when, under the influence of the Gothic revival, the cathedrals and abbeys of the Middle Age were deemed to be the true models for the material home of the Anglican Church to-day. What was now wanted was not any recrudescence of Mediaeval imagery or Byzantine symbolism, but a view of church building which was in harmony with the greater thoughts that were the inheritance of the age. Expression rather than symbolism should be sought in church architecture, and if a church had calm dignity, solemnity, simplicity, permanence and such qualities, other symbolism and style was superfluous. Brunelleschi's churches had these qualities in more than ordinary measure and, although his work led to a revived Latinism, he was no copyist. Rather he was one who discovered and revealed the ancient world. Since then we had passed through three stages in regard to it—initiative, archæologic and scientific—but before us dawned another aspect, in which we should learn by wider and fuller knowledge to be ourselves. Until our education enables us to build upon the larger tradition supplied by all architectural history we must make the best of the traditions of the Renaissance, under whose influence we still live. Illustrations were given of nearly all Brunelleschi's architectural works, including the churches of Florence, the Badia de Fiesole, and many of the works of the school he originated. Particular attention was given to decoration of the buildings by sculpture, the purest, most human and sweetest in expression of all the ages, and in this connection several of the works of Donatello, Luca della Robbia, Ghiberti, Jacopo della Quercia and others were shown on the screen. A discussion followed, in which the comparative merits of Gothic and Renaissance architecture were discussed. It was suggested that in Gothic there was a greater feeling of unity, inasmuch as the ornamentation was almost of necessity part of the structure, while in Renaissance it had more the appearance of something superimposed upon the architecture. The thanks of the Society were given to Mr. Anderson for an exceedingly able and interesting lecture.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of this Association was held on Friday evening last, the president, Mr. Hampden W. Pratt, in the chair.

The minutes of the last meeting were read and confirmed and the following gentlemen were elected members:—Messrs. C. J. Barker, A. St. John Diamant, A. G. Ross, J. Henry and W. H. Williams. Mr. A. G. Angel was reinstated a member.

Votes of thanks were passed to those who assisted in the entertainment at the conversazione on November 26, and also to Messrs. R. Phené Spiers, Alfred H. Hart, W. H. Atkin Berry, W. G. B. Lewis, A. C. Dickie and members of the water-colour class for lending drawings for exhibition at the conversazione.

Mr. F. J. Osborne Smith read his paper on

The Planning of High and Endowed Schools for Girls.

During the past twenty-five years a goodly number of these schools have been established, and for a lesser number special buildings have been erected.

The requirements have naturally grown, and experience has, as usual, taught many valuable lessons to all concerned.

High schools, I may remind you, are superior day schools for girls of all classes above those provided for by the Elementary Education Act. There were no high schools twenty-five years ago; the word "high" was not used as applied to schools until the incorporation of the Girls' Public Day School Company, Limited, in June 1872. The starting of this company to establish and maintain in London and the provinces superior day schools forms an epoch in the education of the larger half of the inhabitants of England. It was an attempt to meet and correct the defects pointed out in the report of the Schools' Inquiry Commission:—"Want of thoroughness and foundation; want of system; slovenliness and showy superficiality; inattention to rudiments; undue time given to accomplishments, and these not taught intelligently or in any scientific manner; want of organisation."

The first school was opened in January 1873 at Chelsea, in an old house adapted for the purpose. There are now thirty-four schools belonging to this company, and various others have been established by limited liability companies, which were formed usually to establish individual schools.

Existing buildings, more or less adapted for the purpose, formed the first homes of many flourishing schools now housed in buildings the planning of which is based upon the knowledge thus gained. Work carried on in buildings originally

erected as private residences or for other purposes revealed almost hourly weak places where time was lost, where adequate supervision was impossible, and where it was hopeless to combat the evils attendant upon temporary and ineffective means of ventilation, low and small rooms, narrow staircases, weak floors, falling ceilings, small and dark cloak-rooms, small fireplaces, insufficient light and other defects.

These drawbacks to effective teaching were well remembered, discussed and digested whenever a new home was in view, and the new school-house, planned and erected for a definite purpose, became at once an added pleasure to the daily lives of both mistresses and pupils and an effective aid to education.

It is difficult to find existing buildings suitable for high schools or that can be made efficient without great expenditure; this sometimes leads to two or more houses (not necessarily adjoining) being occupied by one school—a most trying arrangement for the teaching staff.

To follow in detail the growth and development of these schools in the adapted buildings would make an interesting paper by itself. I propose to dwell this evening upon the types of plans which experience has proved to be best suited for the work which is carried on in high schools.

One of the most prominent characteristics of a high school should be cheerfulness produced by ample lighting, plenty of sky visible, possibility of the sun himself being able to peep into every room, pleasing wall surfaces, good pictures, &c.; all these, except perhaps the last, form a part of the design, and if the architect will make tempting provision for hanging pictures in suitable positions, the pictures will soon follow. Gloom, semi-darkness and all the opposites to bright airiness should find no place where children are being taught.

Spaciousness, too, is an important quality to secure; ample floor space is here meant—not loftiness. Classrooms need not be lofty to be healthy; an excessive cubic space above the pupils' heads makes ventilation and warming more difficult, and is simply enclosed space in the wrong place. It is obvious, also, that inasmuch as it is found desirable to limit the number of children in a class to thirty or forty, the floor space must be limited to dimensions which will enable the mistress to keep the pupils well under control, to speak to them all effectively without strain and have access to each desk without disturbing the pupils at adjoining desks. These considerations, as well as those of access to the room, space for and around the mistress's desk for teaching apparatus, &c., must be regarded as determining the extent of floor space, even when it is not urgently necessary to keep always in mind the cost of every cubic foot of space you may wish to enclose.

When the room is warmed by the usual open fireplace, the best position for that cheerful, if wasteful, contrivance must not be overlooked, because it also demands a portion of the available floor space.

The relative positions of the door and fireplace in relation to the windows deserve more consideration than is usually given. Waste of space necessarily arises where both door and fireplace are not situated at the end of the classroom occupied by the teacher. It is not convenient for the fireplace to be in the centre of the end wall, sometimes it may be well placed near the door. The corner of the room on the right hand of the teacher is a position with many advantages.

The fireplace should contain some form of ventilating or warm air producing grate, with fresh air brought to it from outside well above the ground, all inlets being short and accessible for cleaning; the air-chamber for warming the incoming air ought also, for cleanliness sake, to be readily accessible. In large rooms, or where there are two or more external walls, it is sometimes found desirable to supplement the fire by hot-water pipes under the windows or along the wall opposite to the mistress. Open fireplaces should not be omitted from schools of this kind without very full and serious consideration of the means to be employed to warm and ventilate the buildings, and especially the classrooms.

This slide shows a form of classroom for thirty pupils, which from its frequent use may be accepted as convenient both in shape and size. The dimensions given are certainly not extravagant, but they are found sufficient when adequate means for ventilation are provided and used. The allowance of floor-space per pupil is 13 feet 6 inches super (or 13.65 feet, to be quite accurate), and the cubic space 163.8 cubic feet per child.

Space should be provided between the walls and desks for access for supervision, and to enable the children and mistress to write or draw upon the slates or blackboards upon the walls. Movable blackboards are inconvenient appliances, but as they are less costly than continuous slates the inconvenience still prevails in too many instances. It is possible still to find classrooms with windows, blackboards and desks so arranged that it is impossible for all the scholars to read what has been written or drawn for their instruction.

The ceilings should be as much as possible unobstructed by beams or other timbers which prevent the ready flow of air or check or divert the air currents.

A point which affects the health and comfort of teachers is the provision of windows at the back of the children. If these windows happen to be in a south wall the evil becomes very trying. A teacher told me a few months ago that one of his eyes was seriously injured from having to face a south window. Moreover, under such conditions some of the pupils' features are in shade, and it is not possible to distinguish the effect of the teacher's remarks upon the children, which is so very desirable, and adds to the interest and pleasure of teaching. Except in cases of special difficulty, it is possible to effectively light any classroom, large or small, from windows in one wall only. An additional window may be useful for obtaining direct sunlight in an otherwise sunless room, or for securing cross ventilation not otherwise obtainable, or for other sufficient reasons, but it will in any case be found desirable to make that window smaller than the rest, or to place it in a corner of the room, or to arrange means of regulating the light from it when required.

The chief use of the assembly-room or central hall is to accommodate all the pupils at one time daily, and its size is fixed accordingly. If the school is thought likely soon to expand beyond a nominal standard this room may be built to accommodate a maximum number of possible pupils; in other cases, where a smaller number of pupils are provided for, with no reasonable prospect of extension, the assembly-room may be of lesser dimensions. As will be noted further on, this hall may serve for access to the classrooms upon two floors, a consideration by which its height is often determined. Naturally, the supplementary purposes for which it is used also affect the floor space, shape and dimensions.

This important room should be near the principal entrance, and have ample means for access; it was a common defect in the earlier schools that only one entrance was arranged. This should be regarded as inadmissible, except in very small schools.

The position of this room in relation to the classrooms is probably the most important factor in determining the general plan of a school.

Side-lighting for this hall is preferable for the sake of ventilation. Where top-lighting is used, great care and judgment are required to avoid too much glass, which, moreover, should be placed as near the sides as possible, in order to prevent deep shadows being cast upon the floor from the balconies. Centre top-lights are rarely successful for schoolrooms of any kind.

Good acoustic conditions ought to be secured for this room.

For convenience of consideration, plans may be divided into three types, viz.:

1. Those which have the principal classrooms and the assembly-room separated by corridors, as in this slide.
2. Those where the classrooms are grouped round a central hall.
3. Those which have classrooms on one, two or three sides of the assembly-room, leaving the fourth side an external wall.

The difficulties of a contracted or otherwise comparatively unsuitable site—while increasing the architect's interest and enjoyment of his work—often lead to varieties of treatment not included in either of these types. These may be regarded, however, as exceptional plans adapted to special situations rather than typical examples.

Sometimes a feeder is fostered in the form of a Kindergarten-room, which should be exceptionally cheerful, on the sunny side of the ground floor, near to the pupils' entrance and to separate lavatories.

A spacious room for drawing purposes facing north or east, with as much floor space as can be afforded, and wide doorway, fitted with cupboards, rails and shelves for models, racks for boards, drawers for paper drawings and materials, a sink, dark blinds, &c., well lighted from one side or end. Usually the best situation for this room is upon the top floor.

Laboratories for teaching chemistry and physics (separate rooms for each if possible), with impervious floors, ample side or top lighting, and special means for ventilation, fitted with working tables, with water, gas and electricity laid on. Also a small room for balances, cupboards for stores, apparatus, &c.

The size of the laboratory must depend upon the extent to which science is taught in the school. It should be lofty, well-lighted, with the windows just above table height, and extending to the ceiling; ventilation must be specially studied, particularly the means of readily producing cross currents of air at the levels of the work-tables and ceiling.

It is convenient sometimes to plan a separate building for science teaching.

A covered playground fitted as a gymnasium.

A luncheon-room for mistresses and pupils, with the kitchen and offices and housekeeper's rooms adjoining.

These domestic rooms should be planned with a separate entrance, and be cut off from the schoolrooms with prompt access from the kitchen to all the school entrances, and from the school to the dining-room. On no account should any of the noise or odours from the domestic rooms be allowed to enter the school proper.

Well-lighted and ventilated cloak-rooms, not less than

9 feet high, and large enough to afford floor space for fittings. The best position for cloak-rooms is, of course, near the pupils' entrance; stands for cloaks should be about 6 feet apart from centre to centre, and about 1 lineal foot of stand space should be allowed for each pupil, with means for drying wet clothes.

A sitting-room for assistant mistresses should overlook the playground and its entrances, and be reasonably near to the head-mistress's room. A small cloak-room and lavatory are convenient and desirable adjuncts. It should not be less in size than an average classroom. The glass line of the windows should be nearer the floor than in the classrooms; in this, as in other respects, the room should be regarded as a work-room and sitting-room combined.

The head-mistress's room with secretary's room and a small waiting-room must be near the chief entrance and the platform end of the assembly-room. Neither of them need be so large as a classroom, but from the windows of the head-mistress's room it should be possible to see the main entrances to the building. This room is a work-room and also a reception-room; it should be well lighted, cheerful and convenient, with a lavatory near at hand.

Stairs should be of reasonably fire-resisting materials which will not become slippery, have easy gradients, wide treads and shallow risers, suitable for the younger children, thoroughly well lighted and at least 4 feet wide, to enable two files of pupils to pass each other. Those to cloak-rooms or where there is an exceptional amount of traffic should have hand-rails on both sides to prevent accidents and be, say, 5 feet wide.

The position, form and size of the staircases are most important; no greater inconvenience in a school can be conceived than a carelessly designed staircase in the wrong place. A building designed to accommodate more than, say, 150 children should have two distinct staircases, as far apart as possible, but both near the assembly-room.

Winders and circular or elliptical staircases are inconvenient and ought never to be planned for these schools wherever it is possible to avoid doing so.

The rise of each step should not exceed $6\frac{1}{2}$ inches; 6 inches is better when obtainable; 11 inches should be the minimum width of the tread (from nosing to nosing). Staircases need not be lofty, if sufficient head room and ample lighting be secured.

Lavatories with wash-basins to accommodate, say, 5 per cent. of the pupils at one time, and closets for, say, 3 per cent., can be in most cases conveniently arranged on two or more floors in a separate wing or other suitable position, disconnected from the main building by a staircase or well-ventilated corridors.

A bicycle store or shed has now become an essential requirement, as girls now ride to school in great numbers. It has been said that "one want creates another," and covered stores for cycles, now they have apparently come to stay, must be considered and placed as near to the pupils' entrance as may be safe and convenient.

Last, but not least, a spacious levelled playground for tennis and other games, small border gardens for the pupils' botany specimens, cricket and hockey meadow, &c.

The endowed schools have often extensive playgrounds. Trees upon the site should be judiciously preserved for their own sake as beautiful objects, and for the sake of the shade afforded in hot weather.

Seven feet is a desirable width for main corridors, which should not be of less height than the rooms adjoining. Windows at each end are essential, and there should be ample lighting throughout, especially at points where they deviate from a straight line.

Having thus briefly noted the requirements, let us now consider the three types of plans before mentioned.

It will be seen that in this type the assembly-room is treated as a separate room, and does not afford access through it to other rooms. It can therefore be used for drill, singing lessons, special classes and other purposes, without causing inconvenience and hindrance to work going on in the classrooms, and also without the work going on in the assembly-room being interrupted by children passing through from the classrooms.

That is an obvious advantage provided at the cost of constructing the corridor.

The corridor constitutes the chief variation between this type and another, as will be seen later on. In this design the most important storey is the first floor, which is approached by covered stone steps (see perspective). The head-mistress's room is on the right of the vestibule and a waiting lobby on the left; two classrooms and a corridor are entered from this lobby; other classrooms are on the right, and two at the left in a line with the assembly-room.

Two well-lighted staircases, one at each end of the corridor, lead from the ground floor to the second floor, and there are large borrowed lights between the assembly-room and corridor, and over each classroom door.

On the second floor are classrooms over those below, a small laboratory over the head-mistress's room and vestibule; one of these classrooms is fitted as a science lecture-room, and a large studio at end of assembly-room. On the ground floor are the pupils' entrance, with cloak-rooms on the right and dining-room on the left, a gymnasium under part of the assembly-room, mistress's room, lavatories, tradesmen's entrance, kitchen and offices, two rooms for special work, furnace chamber, fuel store, serving-room, &c.

There is access to the playground at three points.

Most of the classrooms are lighted from the south-east, the assembly-room faces north-west and the studio north-east. This school accommodates 320 pupils, and is found, after being in use for twelve years, to be convenient and suitable for the purpose. The playgrounds attached to the school are exceptionally extensive for a high school. Classes are held there under the trees in summer.

Where the rooms are grouped round a central hall some of them will be less cheerful than others, owing to the diminution of direct sunlight. The noise of drilling and singing will interfere more or less with the work going on in the adjoining classrooms, and the passing of children from the classrooms to other parts of the building will tend to disturb the work going on in the assembly-room. To set against these drawbacks, which are possibly more apparent than real, there are many advantages, viz. compactness of plan, economy of space, increased facilities for effective supervision, &c.

The assembly-room gives access to two storeys of classrooms, the upper ones being entered from a gallery arranged on all four sides.

This form of hall is easier to light than would appear at first sight. In fact, one has to be very careful indeed to avoid having too much lighting surface, which, it must never be forgotten, is also chilling surface in cold weather and heating surface in summer time. It is a common and fatal error to underestimate the value of a square foot of top-light—fatal to comfort, convenience and health.

The assembly-room is occasionally used also for prize distributions, lectures, concerts, private theatricals and similar functions, and by this plan the adjoining rooms and galleries can be used to increase the accommodation for visitors and parents.

Plans of this type are a variation upon the central hall type, inasmuch as there are no classrooms upon one side from which the hall is lighted through windows in the only external wall. In this form of plan the classrooms are grouped along the quietest or most cheerful side of the building, the assembly-room, studio, laboratory, cloak-rooms and other rooms occupying positions which are less important in this respect. Galleries are required only on one or two sides, and the drawbacks of the central hall type of plan are somewhat less in this type.

The conditions of the site usually settle which type of plan shall be used. There are, of course, some sites where all sorts of variations and adaptations will be found necessary.

Some peculiar and exceptional opportunities for skilful and picturesque planning arise when one has an existing building to utilise and fit in.

The width of doors to classrooms should be limited to dimensions which will permit the passage of the usual movable furniture; 3 feet to 3 feet 3 inches is usually sufficient. Those to studios, corridors, cloak-rooms, dining-rooms, entrances, &c., should be wider, with pairs of doors hung folding or to swing, as may be found desirable.

Glazed upper panels in doors, and also a second door leading from one classroom to another are very useful in assisting supervision and maintaining discipline. Glass panels are sometimes objected to for apparently good reasons, but they are usually found to be convenient.

The essential points to be borne in mind regarding windows are:—

The chief lighting for all rooms, except those for science teaching, should be in one wall only, that on the left-hand side of the pupils, with an extra window conveniently arranged where possible for cross-ventilation or extra sunlight.

The glass line should be as near the ceiling as possible, and not nearer the floor than 3 feet 6 inches or 4 feet in classrooms, and the glass should be clear, except in lavatories and a few other positions.

The window frames should be as near the outer surface of the wall as appearance, Building Acts and other circumstances will permit, to afford means for obtaining admission of air without interfering with blinds, &c., and also to allow the maximum of floor space to be used without the desks being placed too close to the glass.

All windows should be made so as to be opened easily by children and to the fullest extent possible, and should be constructed to permit portions of them to remain open if desired while work is going on, without the possibility of downward currents of air being felt by the pupils.

The most suitable kinds of windows are those which can be

opened most readily, and which when open will not admit rain or expose the occupants of the room to strong currents of air.

French casements and centre-hung sashes, although very useful in some positions, are not as a rule desirable for classrooms. Double-hung sashes, with hopper casements over them hung to the transome are a common and useful form of window. Hopper casements hung to sill and to transome, with centre or side-hung sashes between them, are found convenient, and comply with the conditions above referred to.

In the wall opposite to the windows, openings near the ceiling, fitted with hopper casements, are extremely useful in obtaining cross ventilation of the rooms during the intervals for recreation and when the school is closed.

Fireplaces are conveniently arranged in the wall facing the children, not in the centre, if it is possible to place it either near the door or in the corner near the windows, especially when warm air grates or stoves are used, as then the cold air inlets are short and accessible. It is very important that all stoves or grates used for warming the air should be capable of being taken to pieces to allow the air channels to be kept clean.

Cloak-room Fittings.

Stands from 5 feet to 6 feet from centre to centre; seats and boot-racks, with hot-water pipes below them, are usually provided. Where this is not possible, other means for occasional drying of damp clothes are desirable.

Cement, asphalt, tiles, wood blocks, or similar materials capable of being readily cleaned are most suitable for the floors; cement or varnished wood for dados.

Lavatory Fittings.

The water should be laid on to the basins and water-closets direct from the high-pressure mains, or from cisterns placed at a considerable height above the lavatories.

The diameter of the pipes will depend, of course, upon the size of the lavatory ranges or the number of closets to be served, as well as their position below the main cistern. A very important point to bear in mind is that the closets and lavatory basins are often all in use during the same time, therefore all service pipes must be exceptionally large. There are so many disadvantages connected with the small flushing cisterns which water companies insist upon, that other methods of flushing the closets are arranged when water is supplied through a meter, such as lead-lined trough and spindle valves over water-closets or continuous cistern. The stoneware trough and automatic flushing-tank arrangement for water-closets partially avoids these difficulties; but a separate water-closet apparatus and flushing arrangement has many advantages over the trough method. Ranges of water-closets in or adjoining a building should be invariably separated from the corridor or stairs which gives access to them by a well-ventilated lobby or passage, in which may be placed the lavatory basins. These lavatories should be roomy enough to allow pupils to pass freely to and from the water-closets while others are using the basins.

The height of the lavatories and water-closets need not exceed 8 feet 6 inches or 9 feet; a separate window for each water-closet, inlet ventilators near the floor of the lobbies or lavatories and outlet flues from the ceiling level up to above the roof are desirable.

Walls.

Walls must, of course, be built of sufficient substance to resist heat, cold and moisture. Hollow walls in very exposed situations are useful, in spite of their disadvantages; but solid walls of good materials are better for ordinary positions. All openings in walls, flues, chases, &c., should be made accessible for cleaning.

The greatest care should be taken, and thoroughly effective means should be adopted to prevent moisture penetrating the walls from above downwards, or from the ground upwards. Solid damp-proof courses, formed of asphalt, slate, cement, &c., ought alone to be used, being much more effective than the various glazed perforated substitutes.

Roofs.

Roofs, if of the usual wood rafters, and slate, tile or lead coverings, should be close boarded, and have some non-conducting material under the outer coverings.

Floors.

Floors of classrooms should, if possible, be impermeable, and covered with wood. Where wood joists are used special care should be taken to insure rigidity, and provide effective means of checking the passage of sound and air through the floors.

Floors of all lavatories and science-rooms should be solid, with hard, non-absorbent coverings. The use of porous breeze concrete for such floors is not to be commended. Wood floor coverings should be polished, and have skirting fillets of sufficient width to keep the desks from injuring the wall surfaces.

Ventilation and Warming.

The cost of forming and maintaining a system of mechanical ventilation, and the desire for an open fire for the sake of cheerfulness and prompt control, account for the fact that in most of the schools of the kind under consideration the open fireplace has been utilised.

If a school building be designed to allow currents of air to sweep entirely across it during the pupils' absence, and each classroom be provided with two 9-inch by 9-inch or 14-inch by 9-inch shafts or flues from the floor to above the roof, with inlets to each at floor and ceiling levels, in addition to a large warm-air grate and suitable windows, it is found in practice that reasonably adequate means for warming and ventilating are thus economically obtained.

Their effective use depends greatly, of course, upon the mistresses in charge of the rooms, but it is an exception to find a head-mistress who is not keenly alive to the value of the means afforded and familiar with the use of them.

Vertical inlet tubes, deep sill fillets to windows and the various valve ventilators, are all useful as aids when kept clean; but unless air is warmed before it enters a school the inlets will remain closed during six months of the year when fires are in use. This fact accounts for the popularity of the various ventilating grates, most of which can be taken to pieces periodically for cleaning, and work best when doors, windows and ventilators are closed.

The assembly-room, corridors, cloak-rooms, lavatories, laboratory, entrance-lobbies and staircases can be more conveniently warmed by hot-water pipes. It should be possible to raise the temperature in the corridors, cloak-rooms, lavatories, &c., to about 50 deg. or 55 deg. during cold weather, for the purpose of preserving a fairly equable temperature inside the building and protecting the sanitary arrangements and water services from disorganisation by frost.

The small pipe medium-pressure apparatus is found very useful for warming schools, on account of the small quantity of liquid used, enabling heat to be produced in less time than with larger pipes. These small pipes, moreover, can be used under skylights and in other positions where the larger pipes could not conveniently be placed.

The practice of arranging hot-water pipes in channels below the floor of the spaces to be warmed, with open gratings above them, is unnecessary, wasteful and dangerous, because of the difficulty of keeping the pipes and channels free from foul matter from boots and floors. Enclosing hot-water coils in ornamental casings is objectionable for the same reason.

The last word upon warming and ventilating crowded rooms has not yet been said; the present methods are not perfect. The air in streets is polluted in a manner which it is to be hoped will be regarded with amazement in the near future, when thick clouds of unconsumed fuel, foul exhalations from so-called sewer ventilators at the level of the roadway, and the fibrous filth from wood pavements are no longer allowed to adulterate the precious air, which ought to enter our houses unsullied by such dangerous and unpleasant companions. At present the windows and doors are often closed and the air refused admittance because it cannot enter alone.

Air in buildings will always require warming in winter, but it need not require washing and filtering as it does now.

The problems met with in endowed schools for girls are very similar to those in high schools, and are solved in much the same way.

Endowed school governors are too often not overburdened with funds, the endowments having been usually severely taxed to provide new buildings for the education of the boys before it was thought desirable to make similar provision for girls.

In conclusion, I venture to hope the movement for giving increasing facilities for secondary education to girls will continue, and that those of us who form part of the lesser half of the population will assist with all our energies in this desirable work, even if it should lead to provision being made for training and encouraging women to study architecture in the coming new home of this Association.

Mr. Banister F. Fletcher proposed a vote of thanks, and raised several questions, among others whether there was any type of window Mr. Osborne Smith preferred. The mullion type, from being more academic, appeared more suitable to this class of work. If double-hung windows were used they could not do better than adopt the detail of those of the London School Board. For steel casements the N.A.P. were to be preferred.

The motion was seconded by Mr. Seth-Smith, and was supported by Mr. E. Howley Sim, Mr. Langton Cole and others.

Mr. Osborne Smith, in reply, said mullion windows were costly, and that was an important consideration which often prevented their use.

It was announced that the next paper by Mr. L. A. Shuffrey on "House Painting" would be read at the meeting on December 17.

NOTES AND COMMENTS.

WHEN it was proposed to assign the Galerie des Machines in the Champ de Mars to the two rival societies of French artists for their exhibitions in 1898 and 1899, almost the first stipulation was to have two separate entrances, at each of which payment was to be made. That arrangement was adopted. As a result of communications between the two presidents, M. PUVIS DE CHAVANNES and M. EDOUARD DETAILLE, the arrangement has been set aside. While each Society can adopt its own regulations as if they were far apart instead of being under one immense roof of steel and glass, there will be a common entrance; and what will be more agreeable to economic amateurs, the payment of a franc will insure entrance to the two exhibitions. After so remarkable a consequence of the negotiations it is not easy to see why a further approach should not be attempted and the two societies become united.

THE preceding commissions on water supply for the Metropolis have proved that the subject is almost endless, and may be investigated for many months without discovering any novel source or new system of storage and distribution. The Commissioners who are now sitting have acted wisely by announcing on Monday that they will not reopen the questions on which a report was prepared by Lord BALFOUR's commission. In that report it was concluded that the water supplied to consumers in London was of a very high standard of excellence and purity, and was suitable in quality for all household purposes, and that by the construction of storage reservoirs and the carrying out of other works a daily supply of 420,000,000 gallons could be obtained from the existing sources of supply in the valleys of the Thames and Lea. This quantity, it was estimated, would be sufficient to supply thirty-five gallons per head to a population of 12,000,000 persons, or about three-quarters of a million in excess of what the total population of Greater London, together with the outlying parts of London, would have become in 1931 if the present ratio of increase were maintained. At Monday's sitting not much progress was made with the inquiry, and the case for purchase by the London County Council was not strengthened by the admission of Mr. CRIPPS, the Parliamentary agent, that arrangements had been made to transfer the powers over the water-supply of the parts of the metropolitan area in Surrey, Kent, Essex, to the respective county councils. There would also be transfers to Hertfordshire and Middlesex, West Ham and Croydon, if desired. There would, consequently, be no one controlling power, and the evil of the existing system would be revived under another form.

THE second publication of the British fire protection committee was to contain the opinions of some American experts on modern forms of building construction. But owing to the calls on the executive by work in connection with the City fire, the pamphlet will not be issued for a few days. In the meantime Mr. SACHS's paper on the Paris Charity Bazaar fire has been reprinted with a report of the discussion at the Architectural Association, and appears as a substitute. Several papers, essays and summaries are in preparation and will be issued at short intervals. The Stationery Office has placed a collection of Acts of Parliament, Blue Books and official publications relating to fire protection at the disposal of the committee.

THE progress of the new church in the parish of St. Andrew's, near Bradford, will be watched with interest, for the construction involves some delicate questions in ecclesiastical law. The plans were prepared by Messrs. T. & H. HEALEY, of Bradford. A site was given by Mr. G. E. TURNER, of Horton Grange, who also promised 2,000 guineas towards the endowment fund, while his mother offered to give 1,400l. to the same fund and 1,000l. to the building fund. It was proposed to lay the foundation-stone on the 1st inst., but the Bishop of RYON desired

to have the ceremony postponed, as his lordship had the offer of another site in the parish. Mr. TURNER, however, laid the foundation-stone, but apparently there were no clergymen to witness the proceedings.

THE French medallists are not so eager as architects to take part in competitions. The Government arranged to have a medal produced which is to commemorate the voyage of M. FAURE, the president, to St. Petersburg. In order to obtain a satisfactory design the Ministry of Fine Arts applied to the principal medallists in France to send in sketches. Very few artists have responded to the appeal. The models sent in are, it is understood, of a suitable character, but it is evident that the competition system is not equally acceptable to all artists in France, for in the present case there has been a marked failure.

LORD EXETER has appealed to all who are interested in the preservation of sacred and historic monuments for further aid towards the restoration of Peterborough Cathedral. The south-west and central gables of the west front, and the north transept and the eastern chapel, are an immediate cause of anxiety. To cover these repairs, 7,500l. is required. The skill shown by Mr. PEARSON and his assistants in taking down and restoring the old stone work is a security, says his lordship, to any who are alarmed lest the old features should be sacrificed, and is a guarantee that money sent to the Dean of PETERBOROUGH to forward the committee in their work will be spent upon that which Mr. PEARSON reports to be absolutely indispensable.

THE organisation of the Perth Architectural Association is now established. Mr. G. P. K. YOUNG is the first president, Mr. R. J. GILDARD is vice-president, and Mr. W. M. PAGE honorary secretary. The meetings are to be held in the lecture-room of the Natural Science Society on Wednesdays. The following papers will be read during the session:—"Dean of Guild Court Procedure," by Mr. JOHN ANDERSON; "Reasonable Supervision," by Mr. JOHN SMART; "The Graphical Solution of Problems in Architectural Dynamics," by Mr. JOHN Y. GRAY; "Gasworks Construction," by Mr. ANDREW WILSON; and "Some Account of the Arts in Southern Italy and Sicily," by Mr. F. W. BEDFORD, of Leeds. The committee have also arranged for visits to buildings in progress.

THE Americans are ahead of us in the utilisation of steel. Inspired, no doubt, by the report of the cage which surrounds the hut of the unlucky Captain DREYFUS, it was decided to immure the prisoners in the new penitentiary for Erie County in cells that form a series of cages. Along the outer walls is a corridor for gaolers 3 feet in width. The cells are enclosed on the side next the corridor by hexagonal steel bars of the strongest material, which are placed about 6 inches apart, arranged in such a way as to form a structure no part of which can be easily separated. The doors, ceilings, and side walls of the cells are formed of steel plates. The cells are therefore under the observation of the guards in the corridor, and it is not possible for the prisoners to communicate with their neighbours. The heating and ventilation is so arranged as to prevent communication by the pipes. The cells open on a balcony which is formed of steel bars, and extends throughout the different floors up to the roof. Consequently there cannot be any of the accidents which are common in English gaols, and which are caused by prisoners throwing themselves or their keepers over the barriers or hand-railing. In these balconies the prisoners can take exercise. The balconies lead to a watch-tower, from which the officers as well as the prisoners are to be observed. It is anticipated that in addition to the security which is offered by the gigantic cage, economy of space and of the expenses of administration will be secured. America has introduced many alterations in prison discipline, and the new cage will probably lead to other improvements.

ILLUSTRATIONS.

M'EWAN HALL, EDINBURGH UNIVERSITY.

THE plan of the Hall is based on the form of the ancient Greek theatre. This form was chosen as best suited for an auditorium, and one likely to insure good acoustic results. The architectural treatment is the same as the rest of the new University buildings, designed by Dr. ANDERSON, and of which we have published some illustrations, viz. Early Italian Renaissance. The flat side of the semicircle abuts on the Medical School on the west, while the principal elevation is directly opposite on the east.

Here is situated the principal entrance, 30 feet in height and 16 feet in width, flanked on each side by double pilasters and crowned by a semicircular pediment contain-

This section is divided from the upper by a band of Italian ornament, with panels at intervals containing the coats-of-arms of JAMES VI., the City of Edinburgh, the University of Edinburgh, the donor of the Hall, the late Sir ALEXANDER GRANT, a former principal of the University; the Right Hon. A. J. BALFOUR, chancellor; the late J. CHRISTISON, W.S.; Sir WILLIAM MUIR, principal, and Sir WILLIAM TURNER, trustees of the Hall. The upper of the three horizontal sections is arched in red stone, and is surmounted by an architrave, frieze and cornice and an open balustrade. The height of the outer wall from the base to the top of the balustrade is 64 feet.

An interior wall concentric with the outer encloses the Hall proper, and rising above the outer wall, to which it is joined by flying buttresses, supports at its summit the

ing a carved representation of the ceremony of conferring academic degrees. Besides this, there are other six entrances to the Hall from the outside. The external wall is divided vertically by projecting buttresses, containing niches for statuary. It is divided horizontally into three sections; the lower section is panelled and is pierced by the circular windows which light the interior corridor; the intermediate section is blank, with the exception of one panel which contains the inscription recording Mr. M'EWAN's gift to the University in these terms:—

Hanc Aulam Academicam
Gulielmus M'Ewan
Universitati Edinburgensi
Libens Animo Donavit
M.D.CCCXCIV.

dome-shaped steel roof, which is surmounted by an ornamental lantern 30 feet high. The total height from the street level to the top of the lantern is 130 feet.

The outer and inner walls of the Hall are 12 feet apart. The space between them is, on the ground floor, utilised as a corridor. This corridor is divided into compartments by pilasters, and is vaulted, the panels of walls and vaults being filled in with fine red brick. The flooring is of marble mosaic. The corridor runs round the entire auditorium, and gives communication between the various staircases, entrances and exits. The entrance to the principal staircase, which is placed in the south angle, is from the quadrangle of the University buildings. This staircase is oblong in form, and is carried on pillars and arches

which are vaulted. Its broad shallow steps are guarded by a balustrade of stone. The groined ceiling is decorated in colour, the main features being a series of coats-of-arms, including those of the rector, Lord BALFOUR OF BURLEIGH, and the late rector, the Right Hon. T. P. B. ROBERTSON, besides those of the already mentioned dignitaries of the University which find place on the outside wall. On the mosaic flooring of the landing are panels containing the arms of the donor, the city and the University.

From the first landing of this principal stair access is gained to the reception-rooms set apart for the assembling of the *Senatus Academicus*, distinguished guests, &c.

The staircases leading to the galleries are placed in the round projections at the south and north-east angles of the building. Two staircases are placed in each projection, one leading to the first gallery, the other to the second, so that the two currents of people going to and coming from these parts of the house are kept entirely separate from one another. This plan of double staircases gives much greater facility of entry and exit.

From the corridor on the ground floor entry to the Hall is gained by five separate doors.

The dimensions of the Hall are spacious, the internal diameter being 106 feet, while the height to the dome light is 90 feet. This gives an ample floor space and provides abundant room for the placing of two galleries.

The area floor is laid with blocks of oak in patterns, and in order to allow of its being used for other than formal academic functions the seats on it are of a movable character, only round the circumference are four tiers of fixed *fauteuils*, also in oak.

The wall is panelled in oak up to the height of the first gallery.

The galleries are placed over the corridors on the ground floor in the space between the outer and inner walls of the Hall, the inner wall being opened up to the interior of the Hall by means of an arcading of thirteen bays, each 15 feet in width, and rising from the floor to the top of the arch, a distance of 48 feet, upon columns of red Corsehill stone, supported as far as the balustrade of the first gallery by square-moulded freestone bases and surmounted by gilded Corinthian capitals.

The pews in the galleries are of oak, placed on a sloping platform, and the galleries are guarded by an open balustrade of the same material. These balustrades have central panels, those of the lower gallery being filled with appropriate designs carved and gilded. At the wall head is a carved stone frieze and cornice, above is a coved clerestory with circular windows 7 feet in diameter, while the whole Hall is covered in with a dome constructed of steel and panelled with wood.

In the centre of the dome is a circular light 22 feet in diameter, which with the clerestory windows lights the Hall in the daytime.

The flat side of the Hall, that abutting on the new University buildings, is reserved for the platform, and the arrangements of it are especially designed for University ceremonies, as the Hall is primarily for academic purposes. At the back of the platform is a series of stalls, constructed of solid oak, for the members of the *Senatus Academicus*, University Court, &c., with special seats in front for chancellor, rector and principal.

As, however, if restricted to its original purposes, the Hall would only be used two or three times a year, Mr. M'EWAN expressed a desire that its uses should be extended, and that it should, as much as possible, be made available for civic functions and for concerts of a high class. Following up this idea a magnificent organ, probably the finest in Scotland, has been placed in the hall. Considerable difficulty was experienced in arranging for the placing of the organ in the Hall, which was never intended for one.

The construction of the organ was committed to the Hope-Jones Electric Organ Company, and as the nature of their mechanism admits of the organ being broken up into sections, a position was ultimately contrived for it.

The organ gallery, carried on carved oak pillars, projects over the back row of stalls, and the great organ is placed immediately above. Two other sections of the organ are placed high up on each side of the platform recess. All these are enclosed in handsome carved oak cases, gilt and

coloured, corresponding to the rest of the woodwork of the Hall. A movable orchestra has been constructed capable of accommodating 300 people.

The framework is of light steel, the floor and seats being of wood. It is made so as to fit over the stalls on the platform, and can be taken to pieces easily and as easily put together again.

The Hall is lit by electricity. Before arriving at the present arrangements a long series of experiments was made by the architect and the electric engineers, Messrs. KING & Co., as to the best method of lighting the Hall. The result is considered by all who have seen it to be most satisfactory. A large pendant hangs from the dome. Above the cornice, but concealed, is a series of lights round the whole circumference of the Hall; these throw a light on the decorations of the dome. The galleries are lighted by placing lamps concealed behind the pillars and the lower beams of the gallery fronts. The result of this concealed disposition of lamps is that the hall is lighted without the eye being distracted by numerous small brilliant points of light from the lamps.

The complete design for the Hall included a great tower at the north-west angle rising to a height of 230 feet. The lower part of it only has as yet been executed; it has been carried up to the height of the roof of the Hall.

The great object of the architect in designing the Hall was not to give it the appearance of a hall designed to hold the maximum number of people in a given space, but to give it as much of a monumental character as possible, consistent with the requirements of a good auditorium.

The architect is Dr. ROWAND ANDERSON, H.R.S.A. Mr. E. L. CLARK was his clerk of works. The decoration is by Mr. W. M. PALIN.

The illustrations were reproduced from excellent photographs by Mr. A. A. INGLIS, of Rock House, Calton Hill, Edinburgh, who has published a series which represents all parts of the building.

CATHEDRAL SERIES.—CANTERBURY: CLOISTERS, LOOKING NORTH-EAST (SHOWING END OF CHAPTER-HOUSE).

CATALOGUING AT SOUTH KENSINGTON.

THE following evidence about the catalogues in use in the Art Library of the South Kensington Museum was given by Mr. W. H. James Weale, the late keeper, before the select committee on Museums of the Science and Art Department:—

Lord Balcarras: I should like to ask you with regard to your catalogues. It has been stated in the press frequently, and I wish to know from you as the responsible officer, whether it is the case that there are numbers of a single book in the library, apparently for no particular reason, the only explanation given being that the catalogue is so ineffective and incomplete that you really do not know what books you have got in the art library. I should like to hear your observations upon that point?—It has been my great difficulty in the library to find out what it contained. The reason for that is that apparently there had never been any rules drawn up for the cataloguing of books. One person catalogued a book in one way and another in another, and I found it extremely difficult to find out when a book was offered whether we had a copy of it in the library. It depended more on the memory of one or two attendants than on any other means of finding out. I will give you an example. Before I was keeper of the library I was one day working there, and a German gentleman came in and asked for the "*Repertorium für Kunstwissenschaft*," a review constantly in use in Germany. He was told by the attendant that it was not in the library. I overheard this, and I said, "Oh, yes it is, I had it yesterday," and I mentioned where it came from. The attendant got it, and then it was found to be catalogued in the library under the head of "Art.—*Repertorium*," and there the title was given; but of course no person would look for the "*Repertorium für Kunstwissenschaft*" under the vague title of "Art"; they would naturally look for it either under the word *Repertorium*, or under the name of the editor, or at least there ought to have been cross references from those two. Then, again, I was once asked by an assistant-keeper to purchase a volume upon German architecture, by Dr. Dohme.

Whom did you say you were asked by?—My then assistant-keeper, or one of them rather. I would rather not mention names because he is deceased. The book came in, and then it was at once seen that we must have it in the library; it is the first volume of "*Geschichte der Deutsche Kunst*." There are five volumes—one on architecture, by Dr. Dohme; one on

sculpture, by Dr. Bode; one on painting, by Janitschek; one on engraving, by Luetzow; and one on industrial art, by Dr. Falke. These five volumes were only entered under the heading of Bode.

Is that the name of Dr. Bode?—Yes. His volume on sculpture was put in the catalogue, and of the other volumes there was no mention and no cross references, and I found it necessary to undertake what has really been a very arduous task—the re-cataloguing of the whole library.

I do not think you have quite answered the point that I wished to bring out. You have told me that the catalogue is arranged upon no definite rules, with the result that the cross references and entries are misleading. I asked you whether the result of that had been that either in your prints and drawings department or in the art library proper you had bought more than one copy of a print or drawing or book. Do you understand what I ask?—Yes, perfectly. I have occasionally, I believe in seven or eight instances, myself bought books under the impression that they were not in the library, after a very diligent search in the catalogue, and on the shelves in the section of the library in which I thought the book would be found. I may say also that before my time (I have just put a few notes together as instances) I find a book bought and catalogued under the name of Bourguignon (Hubert François), and I find another copy bought a few months afterwards catalogued under the name of Gravelot, one copy being quite sufficient in the library. There are very many cases of this sort. [Sir John Donnelly has kindly pointed out that I was mistaken in saying that the second copy of Bourguignon, the work referred to, was bought a few months after the first, and that it was purchased in ignorance of the first copy being already in the library. I regret that I should have made this twofold mistake. I should have said that the first copy, a very fine one, with proof engravings, was bought for 2*l.* 10*s.* of Mr. Quaritch, and the second, an ordinary copy, for 7*l.* 7*s.* It must not, however, be supposed for a moment that this was a solitary instance, and I wish now, speaking deliberately, to repeat and to emphasise my assertion that duplicates have been constantly purchased owing to wrong cataloguing, owing also to delay in cataloguing, and thirdly, owing to defective or incomplete cataloguing.]

Sir Francis Powell: Are you speaking of what took place before you entered?—I have mentioned that I have myself bought seven or eight books which I could not ascertain were in the library, the catalogue being defective. These books had been purchased before my time (these that I am speaking of now), and they are entered in the catalogue in different ways. For instance, there is one that is entered under "Scotland.—The British Antidote," and another copy of the same book under "Bute, John Stuart, Earl of," the fact being, as I have found out, that the second-hand bookseller's catalogue from which they were bought had them entered in that way; our catalogue slips, instead of being properly drawn up, were simply copied from the second-hand bookseller's catalogue. There are very many cases of this sort. Then, as regards prints, there is no proper catalogue of prints. I have found quite recently, within the last few days, a print of which we have five copies varying in price; the best copy was bought for 3*s.* and the worst copy for 1*l.* 5*s.*, bought long after the 3*s.* copy.

Chairman: When were they bought?—All before my time.

Sir Henry Howorth: You attribute this to the want of a proper inventoried catalogue?—Certainly.

Lord Balcarras: I understand that in most libraries there are rules, are there not, for cataloguing?—Yes.

The Bodleian and the British Museum, for instance?—Yes, very strict rules.

Why do you not have rules?—It was the first thing I did. I came into office on August 20, 1890. To my astonishment, I found there were no rules whatever. I then set to work, taking the British Museum rules for my model, and slightly altering them to suit the particular nature of the art library. I mean in this way: the British Museum officers catalogue an illustrated book under the author's name; they add "plates," but they give no more information. Now, supposing the illustrations in a book should be by an artist such as Vergil Solis, or any other great artist, I should put "so many illustrations by Vergil Solis," and "so many by Joost Amman," and then cross references from the illustrator, which makes those illustrations immediately available to the student.

However, you have got your own library rules now?—Yes.

I want to know whether you can substantiate your statement that there are very many cases of this. Are there any other cases?—An immense number.

Will you please specify a few?—I can specify several. "Ioannes Bochius. Descriptio publicæ gratulationis . . . in adventu Ernesti Archiducis Austriae, 1595." First copy bought November 30, 1863, 14*s.*; second copy bought March 17, 1868, 16*s.* 6*d.*; and third copy bought March 28, 1868, 1*l.* 18*s.*, eleven pence for the second copy, and more than double the price paid for it. Now the strange thing is—I do not wish to men-

tion names—that almost all these duplicates have been bought of one bookseller—the same bookseller.

Give me another case.—Charles Empson. "Observations and Correspondence relative to various Ornaments of Gold, &c.," 1838. I have just asked Sir Edward Maunde Thompson what he considered the value of it, and he said 3*s.* 6*d.* The first copy was bought on April 20, 1874, and was bought for 7*s.* 6*d.*; the second copy was bought on July 9, 1880, and was bought for 2*l.* 5*s.*, the book being an utterly useless book for circulation certainly. It refers to a few Mexican gold antiquities, as, I dare say, some of the committee may know; perhaps a book that is properly in the library, but certainly not a book for circulation. William Trollope, "A History of Christ's Hospital," 1834; first copy bought February 21, 1857, 7*s.* 6*d.*; second copy bought July 13, 1870, 5*s.*; third copy bought January 1, 1880, 3*l.* 12*s.* I think that that copy may have been bought for its binding, but I have not been able to lay my hands on it. Albert Dumont, "Inscriptions Céramiques de Grèce," 1872—a book really for reference for a museum officer cataloguing pottery; first copy bought September 23, 1871, for 13*s.* 6*d.*; second copy bought on May 6, 1872, for 13*s.* "Alciatus, Andreas—atum libellus Emblem," 1544; first copy bought of that edition May 31, 1870, for 12*s.* 6*d.*; the second copy, not such a good one, bought on August 3, 1882, for 2*l.* 2*s.*, the library containing one or more copies of nineteen other editions of that work, many practically with the same cuts. Then "Chesneau, Orpheus Eucharisticus," 1657; one copy bought on February 2, 1876, for 2*l.* 15*s.*; the second copy bought on June 2, 1884, 1*l.* 1*s.* "Valeriano Bolzani, Hieroglyphica, Lugduni," 1626; first copy bought December 11, 1869, for 10*s.*; the second copy bought on February 12, 1870, for 6*s.* 6*d.* I may mention also that there was another copy bound up with other books. These books were found by me when Sir John Donnelly sent down about the Bourguignon books, and I am always turning up these things every day, and these instances were merely got together off two shelves. I think, if a week was given to me, I could produce perhaps 200 or 300 instances of a similar character.

As I understand, you have a very large collection of photographs at South Kensington Museum?—I cannot say how many, but I should think there are 100,000, including duplicates.

Approximately 100,000?—I think so; that is what I am told.

When you say duplicates, is that duplicates that are in the circulation department, or duplicates which have been bought in the way some of these prints or books have been bought?—I think it includes those in circulation.

Have you got an adequate catalogue of this collection?—No proper catalogue of photographs; there is a sort of a rough catalogue made by an attendant, there is also a printed catalogue of photographs up to some years before my nomination. There is no general catalogue of the photographs; there is a printed catalogue up to a certain date, some years before my nomination; I think it was drawn up by Mr. Derby, but I am not sure.

Does it extend to the year 1880, this printed catalogue?—I do not think it comes down as late as that, but it is a very insufficient catalogue such as it is.

What we should like to know would be the relative size of this catalogue to the entire collection. You imagine that there are about 100,000 photographs in the collection, do you think this printed catalogue contains as many as 10,000?—Yes, I dare say it contains 20,000 perhaps, or more; but I cannot say, as I have not examined it. I consulted it before I came into the library, but I have never used it since.

Why, is it a bad catalogue?—A very bad catalogue.

And at the present time it is entirely out of date?—Yes, quite.

Your modern collection being possibly ten, and certainly five, times larger than it was when that catalogue was made?—That is so.

Are arrangements being made to catalogue those that you have now, to make a fresh, proper and complete catalogue?—I drew out a scheme for cataloguing the photographs of paintings; you see photographs of paintings require to be catalogued in different ways. Our library was founded for the use of students and craftsmen. Take a photograph of a picture; the photograph has to be catalogued under the name of the painter; secondly, if there is anything in it useful to a craftsman there ought to be an index to that; there may be a very valuable bit of goldsmiths' work represented in the picture, in which case there ought to be a reference to that; there may be an important bit of textile or lace. Not many years ago, when I catalogued some Flemish and Dutch lace, I did it only from pictures, dating the lace from the time when that pattern first appeared in a Flemish or Dutch picture. These photographs of paintings are extremely valuable in that way. When I came to the library all the photographs of pictures in the National Gallery were together, all those of the pictures in the Dresden Gallery were together, and all those of the pictures in the Louvre were together. That is of no use to the student. First

of all, for a student of painting you want to bring all the works of one school together, and all the works of each master of that school together, and these should be arranged chronologically, and then there should be a proper catalogue and proper indexes. These are entirely wanting in our library. It is very well if you wish to amuse yourself to look through a scrap-book, but you learn nothing by that; a student does not; he must have things arranged chronologically to show the sequence and the development of art.

Is it a just generalisation to say that with regard to prints you have got an enormous number of duplicate copies?—An enormous number, and as you will see in some cases of triplicates and quadruplicates, and I may say more, that of some we have as many as twenty or thirty copies.

Then is it a just generalisation to say that in a large number of cases these prints are not the originals, but are merely copies or adaptations of the originals?—That is quite so, and I may add that many of them are very worthless impressions that ought not to be in the Museum in my opinion nor in the opinion of many experts who have seen them; they ought never to have been bought.

There is one thing I wish to ask you about which you mentioned just now; you said there may be more duplicates, there may be more copies out on circulation. Have you not got a list of the things that are on circulation?—Yes, we have a list of the registered numbers, but I cannot tell you if the description against the registered number is correct, because in many instances the descriptions are wrong. I will not vouch for them at all. I may mention we have some things down in the register of entries kept by Mr. Reid; we have some prints down as being from the lighthouse of Aix-la-Chapelle. I was very curious to see what this lighthouse of Aix-la-Chapelle could be, because Aachen being an inland town in Germany, how could there be a lighthouse there? But when I had them got out to see what they were I found they were these niello plates from underneath the corona lucis that hangs in the dome of the Carolingian Chapel, but that is called in French *phare*, and I suppose by turning to the dictionary he found that *phare* was a lighthouse.

That is the great branch of candles in the church?—Yes.

This is simply a case of ignorance?—It is a case of having a person to register things who is not sufficiently educated.

You have given us an unlimited number of duplicates, triplicates and so forth with regard to prints, and the other day you mentioned some analogous cases with regard to books, are there any other additions you would like to make?—I think I mentioned that I had purchased myself books not in the catalogue. On April 3, 1893, I purchased a book called "Old Church Architecture of Scotland," 1861, quarto; I purchased it, as I said, after a search by my attendant in the catalogue, and it was stated not to be in the library. I may add that these are extracts from the daybook kept by the attendant in charge of the book in which the books that were purchased from the catalogues were entered each day, and these remarks which I am going to make are in the margin. This work was in the library, but wrongly catalogued. On referring to the catalogue I found that book was catalogued under "Architecture: Scottish Church."

And did you buy a duplicate?—I bought the duplicate under that impression, but having discovered that it was in the library I got the bookseller to take it back. It was purchased under approval; that is to say, supposing the book was incomplete I had the right to send it back, but if not incomplete, I had not the right legally to send it back, but the bookseller, as we are very good customers, took it back. It ought to have been entered under "Scotland" with a cross reference from the author's name, Muir, who is perfectly well known as being the author, but whose name does not appear in the book. He is known to be the author, because he has published other books with his name and calling himself the author of that book.

Are there any other cases?—On June 26, 1893, we bought a book by Claude Du Molinet. "Figures des différents Habits des Chanoines réguliers," 1666. That was in the library wrongly catalogued; it was catalogued in "The Universal Catalogue of Books on Art," which I may say is the work which has generally misled our cataloguers. It was catalogued there under "Molinet (Claude Du)," but instead of being called "Figures des différents Habits des Chanoines réguliers," it was catalogued as "Discours sur les Habits des Chanoines séculiers et réguliers," a different title, you see, the real title being "Du Molinet. Figures des différents Habits des Chanoines."

I do not think we need the full particulars; I merely wish to know if you are able to bear out the statement that you yourself had bought books several times (six times, I think) not knowing that they were already in the library?—That is so. The third instance is on July 10, 1893, a work called "Album des Boiseries sculptées du Chœur de Notre-Dame de Paris." This is printed in the "Universal," under its title, "Album des Boiseries;" but there is no press-mark against it and no "S. K."

against it in the reading-room catalogue, and no cross reference to the author's name under which it is catalogued.

You have since found another copy?—I have since found that it was in the library; and again in that case I got the bookseller to take it back. There are two more on July 13, which, although I have been hunting up, I have not been able to supply the information about. On July 13 there was a book called "Overbeck: Die Bildwerke zum Heldenkreis," ordered by the assistant librarian at that time, which is wrongly catalogued. When I say wrongly catalogued, as you probably are aware, many German books have two titles—a main title to the whole series on the left-hand side, and on the right-hand side another title; and these books, of which the different volumes are sold separately, ought to be catalogued not only under the title on the sinister side, but also under the title on the dexter side. I do not know if you quite follow what I mean.

The broad fact that I wished to understand was that, owing to deficiencies in the catalogue, duplicate books have been sent to the library?—That is an instance.

But you have been able in certain cases to persuade the bookseller to take them back without charging you?—That is so. Then on January 19, 1894, "Bordeaux et Bosquet. Normandie Illustrée." That is an expensive book that was bought, being in the library wrongly catalogued, and the bookseller rather declined to take that back, and so I kept it and sent it into circulation.

He would not let you send it back?—No, I do not think we could fairly ask him to take it back; I cannot recollect who the bookseller was now, but I could not fairly ask him to take it back. It was a heavy book and had been got from abroad, and as it was really a book that might be made use of for circulation I kept it, but I should not have bought it for circulation except under those circumstances. On March 5, 1894, "La Croix. Hypogée—Martyrium de Poitiers." That was also wrongly catalogued, but I got the bookseller to take that back. On June 8, "Kunstgewerbe-Museum zu Leipzig, Vereinsmitteilungen," 1886 to 1889, 30 parts. That was found to be wrongly catalogued, and that also I got taken back. There are some other books which I was not able to get taken back, and which have been kept in the library.

Mr. Bartley: I suppose you are aware that there was a regular scheme made many years ago for the catalogue?—Well, I asked repeatedly when I came there first whether there were any rules for cataloguing, and I was told no.

And although you have been appointed since the year 1890, you have not thought it your business to find out what has been done on the subject of cataloguing in the department to which you were appointed?—I have not gone into the history of it. I have not had time to do that; I have had quite enough to do with the current work and to do it well and properly. About the universal art catalogue, I may say that the reading-room catalogue, which has been called a document or a register, but which is nothing of the sort, because it is a catalogue of books in the library and books not in the library, is not a catalogue of books in the library, but of books in and not in the library.

Mr. Ernest Gray: It is a catalogue of standard works of art?—Of standard and not standard works of art.

Mr. Bartley: Is not that an advantage?—No.

You think it is not an advantage to know that such a book exists on the subject he is studying?—He should consult the universal art catalogue for that.

And you think it is no advantage?—No advantage in a reading-room catalogue; he should consult the universal art catalogue for that. When a reader comes to the library he finds, for instance, a book by "H. C. Reneuë" and when he reads it through he sees it is an edition (revised), the French for the word revised being put down as the author of the book. Or if he gets a Dutch book and there is put down as Deel (J. Tooneel) as the author of the book "The Theatre of the Remarkable Painters of Europe" (Tooneel der uitmuntende Schilders), Dutch for volume i. is made the author of the book. There are numbers of cases like that.

Sir Henry Howorth: Are there any others that you could give?—Yes, I could mention a great many others: Fasti (Mariani), where "Fasti" is made the family name and "Mariani" the Christian name, being the Marian annals; the Latin word "Fasti" is made the surname and "Mariani" is made the Christian name. Then we have Antonio Ferrari of Galata, in the kingdom of Naples, catalogued as Galateus (Antonius); Gerlach (Theobald) of Billican is catalogued as Billicanus (Theobaldus); such a well-known person as Hadrianus Iunius is catalogued as Hadrianus for the surname, and Iunius for the Christian name; Olaus Magnus, again, is catalogued under Olaus instead of under Magnus, Olaus being his Christian name. Magnus is a well-known Scandinavian family.

Chairman:—Would you say what catalogue you are referring to?—The Deel is taken from the universal and transferred into the reading-room catalogue; "Reneuë" also; Mariani Fasti is the South Kensington catalogue. Antonio Ferrari is the South Kensington catalogue of comparatively

recent date; I cannot say who it was catalogued by, without looking up the inventory slip, but it is printed in the supplement of books in the South Kensington Library. Gerlach (Theobald) is again in the supplement to the South Kensington Library. Hadrianus Iunius is originally in the universal, but has the word Cicognara crossed through at the end on the reading-room catalogue, and S.K. put against it. When the book came into the library the cataloguer ought to have seen the title and corrected it, and not kept up the mistake. Olaus Magnus is a South Kensington mistake. Then there is Jean Poldo de Albenas under Albenas, instead of Poldo D'Albenas, which is his family name. That is a South Kensington mistake, and not the universal. Here is another instance, Leovallac, which is the name in Latin of the village where the man was born, instead of Steier, which is the man's name. Such a well-known person as Caius Valerius Flaccus, instead of being catalogued under Valerius Flaccus is catalogued under Flaccus.

EDINBURGH ARCHITECTURAL SOCIETY.

A MEETING of this Society was held on the 1st inst., Mr. J. A. Williamson, president, in the chair. Professor Baldwin Brown delivered a lecture, entitled "Notes on some Edinburgh Buildings and Monuments." He began by explaining that his intention was to touch upon Edinburgh buildings, not from the historical point of view, but only as illustrating matters of general interest to those embracing the profession of architecture. The foremost question of the hour on the artistic side of architecture was that of the meaning and value of architectural styles in modern practice. Many of the younger members of the profession were repudiating the idea of being bound down in their work by the traditions of the past, and were claiming for the designer freedom to work out the solution of modern problems in a modern spirit. The past history of the art, however, showed that the "styles" had not fettered freedom, and that some of the best architects, as for example Wren and Playfair, cared comparatively little what forms they used so long as they obtained those effects of grouping at which they aimed. The truth was that architectural effect depended not so much on the forms themselves, but on the designer's sense of proportion in their combination. There was a distinct advantage in the use of well-understood established forms, because the eye was able to judge better of their relations without the attention being drawn off to the forms themselves. The present age had really its own architectural style, and a very good one, brought down from the Tuscan Renaissance and established here by Adam and Playfair. The fact that we had this tradition of style was, however, obscured by the numerous revivals of which the nineteenth century had been the scene. The lecturer discussed some of these revivals, "Gothic," "Classic," and "Scottish Baronial," in their effect on Edinburgh architecture, and urged architects, if they wished to found a new style, to take the new materials which they used now, iron and steel, and to try and evolve from these materials suitable forms for their treatment.

LISKEARD CHURCH TOWER.

THE Bishop of Truro has addressed the following letter to the Vicar of Liskeard concerning the restoration of the church tower:—

Trenyhton, Par Station: November 27, 1897.

My dear Mr. Norris,—Let me put my counsel in writing. You and Liskeard consider that you have received a decision of the Chancellor's Court which is unfair to you. The law has anticipated your discontent and provided you with a remedy—the higher Court of Appeal.

This has been my constant advice to you. It is supported further by the Chancellor himself, by both the Archdeacon of the Diocese and by the Archbishop of Canterbury. I appeal to you and your wardens, as men of authority in the church and responsible positions in the town—physician, member of the Corporation and schoolmaster—to uphold the public discipline, and lead the people in law-abiding character.

In order to make this easier for you and to prevent any possible risk of life, I said I thought you were justified in removing some of the top stones of the tower to relieve the lower parts of a weight that might be unsafe, and in speaking of this some words escaped from my lips that have to be understood in the sense of my last words—not that I considered you justified in removing the two upper storeys of your tower, but the least amount of its masonry that would temporarily guard the public safety, pending the decision of the higher Court. To do more than this would, I added, bring you within contempt of court by acting before its decree.

I beg you will kindly show this note to your wardens. I shall be glad to subscribe 5*l.* 5*s.* towards the expenses of appeal.—Yours sincerely,

JOHN TRURON.

The Vicar, in a letter to the *Cornish Times*, says:—"I regret my inability to follow the advice of my Diocesan in this particular letter. I am opposed to the spending of any more good money in such useless litigation. We have followed the advice of our Bishop and of our archdeacon in consenting to the terms of Mr. Chancellor Paul, with the result too painfully known to all of us. At the same time I am personally grateful to the Bishop for the permission to take down whatever may be considered dangerous to the church or the lives of the people, of which there is, to my mind, fresh evidence since the fearful storms of Sunday. I am also thankful to our Town Council for having taken up the case, and for their clerk's letter.

"We are advised to again approach Mr. Chancellor Paul to grant permission to take down a portion of the tower, *i.e.* to grant what the Bishop has already granted. To this I strongly object, reasons for which I have given to our churchwardens. I may be in the wrong, but I do not think so; and all with whom I have consulted in and out of the parish do not regard me as being in error. At present I am only concerned in the taking down of the dangerous portion of the tower, so that any and all fear on the part of our people may be removed, and in order that our ministerial work be not damaged. I confess that this last fear weighs heavily with me. Certainly, the spiritual Church ought to be the first and chief consideration.

"I pointed out to Dr. Gott, after our confirmation service, that the dead weight pushing against the first of the north arches of the nave should be immediately taken down, *i.e.* the north and east corner of the tower, or nearly the two upper storeys. I have also intimated my willingness to collect sufficient money to do this work, and if need be to undertake this work—of course, under the sanction of the Bishop.

"It is certain this stagnation cannot continue much longer without the most baneful results following. That we have been unfairly dealt with in this our united undertaking—no open opposition, no opponents in Court against us, no evidence against the evidence of Mr. Sedding, Mr. Lang, Mr. Hancock and Mr. R. A. Courtney, or to the very able and conciliatory address of Mr. Childs—goes without saying. I hope your readers will at once give us their views on this vexed question."

"OLD MORTALITY."

ON Saturday afternoon, under the auspices of the Hawick Archaeological Society, a tablet as a memorial of the religious itinerant was unveiled at Haggiesha', near Hawick. It was in a house, still to the fore, at Haggiesha' that Robert Paterson, the prototype of Sir Walter Scott's "Old Mortality," was born, in 1712, and the Archaeological Society have inserted a tablet in the wall to commemorate this fact, the unveiling ceremony being performed on Saturday afternoon by Mrs. Craig. The Rev. W. A. P. Johnman, president of the Archaeological Society, who presided, in opening the proceedings, said they were that day making an advance in the concrete commemoration of the local memorabilia. About a month ago a programme of these was laid before their Society. "Old Mortality's" birthplace claimed early attention, and the money was voted to accomplish its identification, and they were there now for the purpose of celebrating the completion of this work, of visibly stamping this cottage as the birthplace of "Old Mortality," and of informing all inland and beyond the seas that on this spot got origin that good, quaint and purpose-possessed man who a century ago, in large blue bonnet and hoddin-grey suit, assisted by his four-footed friendly colleague, his bony, wizened, greyhaired Sheltie, made the round of all the borderland and beyond for the purpose of keeping alive the memories of the men who lived and suffered and died for God and religion and native land. The work of "Old Mortality" was very much their work in this region to-day; his was limited and specifically directed toward Covenanting memories; theirs was of a broader and more comprehensive character, viz. perpetuating person and incident of historical importance and of all kinds in bygone days. This was a valuable work, not merely as an embellished page of permanent literature which all there might peruse, but as a kind of extra-mural museum, worthy of a visit from all that were beyond. Many probably imagined that Sir Walter Scott created "Old Mortality"—that he was, to take an illustration from about the same period, a simple analogue of Burns's "Tam o' Shanter." Burns, to all intents and purposes, created "Tam o' Shanter"; Scott, in "Old Mortality," had to handle a personality who would have lived though the novel under that name had never been written. How Robert Paterson, of Haggiesha', got his nickname, which had become his historical appellation, might easily be apprehended, though who first mouthed it might be for ever lost. Like many other designations begun opprobriously, "Old Mortality" was entirely apopros. Were the material forthcoming, in his judgment, no worthier memoir could be published than of this self-denying man, or of one more fit to take an honourable

place among "The Scots Worthies" of these days. Sir Walter met him only once, and far away from his familiar haunts. To that interview, he presumed, they were indebted for the novel of that name. It lay not within his present purpose to criticise that great and thrilling story; but these two facts might be averred—first, the late Poet Laureate regarded it as Scott's "chef-d'œuvre," and that not without valid reasons; and, further, whatever estimate might be put on it as a work of art, unprejudiced opinion must admit that the life and sufferings and services of the men to whom they were to a large extent indebted for their civil and religious liberties to-day were narrated with the pen and prejudice of a caricaturist. By that novel the Great Wizard had set "Old Mortality" upon a platform so elevated and world-commanding that he must be declared to be blind who could not see him and know him. If Sir Walter did not construct a fictitious personality out of a historical and hidden-away character, he practically discovered him to the world, and by uniting the person of "Old Mortality" with his celebrated work of that name secured for him an eternity of fame.

Mr. John W. Kennedy then gave some interesting notes on Haggiesha' and "Old Mortality." In his "History of Hawick" Robert Wilson stated that the place got its name from Michael Paterson, its occupier, providing a monster haggis at the two church festivals of Whitsunday and Martinmas, for the entertainment of the priests who ministered at the altar of Hawick Church. Burnflat, however, was the name that was invariably used in the title-deeds. They might be interested to know that "Old Mortality's" spectacles were in the Hawick Museum, and that a local sculptor had two of his chisels, now also handed over to the museum. In inserting this tablet they linked the district to one of Sir Walter's most famous novels, which owed its creation to the author meeting Robert Paterson in Dunottar Churchyard. Mrs. Craig then unveiled the stone in the front wall of the cottage. It bears the following inscription:—"Robert Paterson, the prototype of Sir Walter Scott's 'Old Mortality,' was born here in 1712. This stone erected by the Hawick Archaeological Society, 1897;" Miss Agnes Wilson unveiling another tablet in the rear wall of the cottage bearing the inscription:—"The birthplace of 'Old Mortality.'" Mr. R. Murray gave a description of "Old Mortality's" cottage, and moved a vote of thanks to Mr. Scott, Pilmuir, the proprietor of the cottage, for allowing the tablets to be inserted.

ST. NICHOLAS'S CHAPEL, LITTLE COGGESHALL.

ON Monday St. Nicholas's Chapel, Little Coggeshall, was reopened and dedicated after restoration. The chapel was built by the monks of the Cistercian Order, about 700 years ago. It is of a simple quadrilateral design, without aisles or transept, and measures from east to west 43 feet and from north to south 20 feet. It is constructed of rubble consisting principally of flints and fragments of early English brick, and it is one of the earliest instances, if not the earliest, of moulded brickwork in the kingdom. Many years ago this sacred building was converted into a barn, part of the south wall being removed and a wing attached. This unsightly addition was demolished shortly after the conveyance of the building was made in 1860 (for 100*l.*) to the vicar of Coggeshall, the late Rev. William James Dampier and his successors in the vicarage. A partial restoration was then effected, and eight or nine years ago about 200*l.* was raised by Mr. G. F. Beaumont and expended in preserving this interesting relic of past ages. After that, the English Abbey Restoration Fund having in January, 1896, promised 550*l.* for a complete restoration of the building upon condition that a similar sum was raised by subscriptions, the Rev. C. C. Mills, vicar of Coggeshall, appealed for help. By the following January Mr. Mills was able to announce promises for the amount required, with 4*s.* 8*d.* to spare. The work was therefore put in hand. The plans were prepared by Messrs. Bodley & Garner, ecclesiastical architects, and the restoration was carried out by Messrs. Rattee & Kett, of Cambridge. The style of the ancient architecture has been affected as little as possible. The old reed thatch has been taken off and where it was necessary to supplant the old timbers of the roof by new, the new ones have been made to correspond. The western portion of the roof has been raised to a level with the eastern half, and the whole is covered with old plain tiles. In the same manner the restoration has taken place within and without. The east window (the old moulded brick mullions of which still remain, as they do also in the west window) is of stained-glass. The central light contains a representation of the Crucifixion. The other windows are of cathedral glass with a framework of oak. The chapel is very nicely furnished, the oak altar having a rich frontal, tapestry panels and canopy with side curtains. The altar ornaments were presented by Mr. Sheldrake, of the Hamlet, and other recent gifts are from Miss Anson (harmonium), the Misses Farnell, Miss Surridge, the

vicar, &c. The vicar will kindly lend for present use his private set of altar vessels and a lectern from the oratory at the vicarage. The font, stained windows, reredos and frescoes for the walls will remain to be given in the future. The chapel will accommodate about 150 persons. The nave is seated with chairs.

CHRIST CHURCH, BIRMINGHAM.

THE sale of Christ Church, Birmingham, and the churchyard was lately completed, but as it is said that a higher price could be obtained, the following statement has been issued by Messrs. Milward & Co.:—

Some months ago Mr. Edge made an offer of 10,000*l.* in cash and 1,500*l.* per annum in perpetual rent-charges to be issuing out of the site, and secured thereon, for the purchase of the church. He valued the rent-charges at thirty years' purchase, making his offer 55,000*l.*, according to his own view. On November 16 last Messrs. Bloxham & Co. made an offer of 62,000*l.* for the site. On November 17 last Messrs. Milward & Co. wrote to Mr. Edge informing him that 62,000*l.* had been offered, and asking him whether he was prepared to make a higher offer. Mr. Edge called upon Messrs. Milward & Co. in reply to this letter, and said that he was not then prepared to say whether he would make a higher offer or not, but that he desired an opportunity of doing so. He was told that a meeting of the trustees would be held at 2.30 P.M. on December 1, and that he must send in his offer before that time if he wished to make one, as the trustees would certainly sell at that meeting. He said that he would wish to come at the time of meeting, and bring his offer if he should have one to make. He was told to come at 2.45 on December 1, and he came. He was then asked to make his offer, but he declined to do so, stating that he was prepared to make a substantial increase upon the offer of 62,000*l.*, provided the trustees would say they were prepared to sell to him, and he would make no offer except upon this condition. The trustees could not be advised to submit to these terms, and therefore passed a resolution that if Messrs. Bloxham, on behalf of the Colmore Trustees, would give 65,000*l.*, the property should be sold to them. Messrs. Bloxham, on being informed of this resolution, accepted the terms, and the sale was made to them at 65,000*l.* Mr. Edge was informed that the property had been sold to the Colmore Trustees, and he then protested, and for the first time said that he was prepared to give 70,000*l.*; but he was told that it was too late, as he had declined to make any offer, except on a condition the trustees could not accept. When the trustees sold the property to the Colmore Trustees they had no other offer before them than of 62,000*l.* from those same trustees, and they had no offer of any kind from Mr. Edge before them except his original one, which amounted to 55,000*l.* It was not until after Mr. Edge was told that the sale to the Colmore Trustees had been made and concluded that Mr. Edge said he was prepared to give 70,000*l.*

TESSERÆ.

Castle Howard.

THIS castle recalls Blenheim, and is by the same architect, Vanbrugh; but it is less broken, and, though not of equal extent, has a grander and more massy appearance. In the whole arrangement of the palace and the garden the architect, evidently had Versailles in his mind, as the *ne plus ultra* of this style. In the grounds are colossal stone basins, to which the flowers planted in them give the appearance of flower-baskets. The principal ornaments, however, are numerous copies of the most celebrated antiques; the dazzling whiteness of which is contrasted with the bright green of the turf. The northern and rude climate has unfortunately made it necessary to paint them with oil colour; only the ancient large Boar of Florence still stands unpainted in a very good copy of the finest Carrara marble. On two sides are pieces of water, over one of which is a large stone bridge. All this, as well as a square building, which has on every side a portico of four pillars of the Composite order and an elegant mosaic floor; a pyramid of considerable size; and, lastly, a very large circular building, surrounded with pillars and crowned with a cupola, which contains the family vaults, give to the whole a rich and truly princely appearance. The high cupola with a lantern, which strikes one immediately on entering the house, is in the same character. According to the tasteless fashion of that age, Antonio Pellegrini, one of the late mannerists of the Venetian school, has painted in the cupola the Fall of Phaeton; so that a person standing under it feels as if the four horses of the sun were going to fall upon his head. The corners are adorned with the four elements. More noble and important than all this show are the manifold works of art of various kinds which the spacious apartments of the palace contain, and which give it the appearance of a museum.

Holbein as a Costume-Painter.

Holbein is our earliest authority for the real everyday aspect of English society. In his time the principle of deference for age was in vogue. People started with the supposition that fifty years and upwards was the only sensible time of a woman's life, and those who had the misfortune to be younger had to make the best of it, being probably assisted by some suspicion that the greater the disparity between themselves and their costume the better they looked. The dress of the majority of Holbein's portraits is of all others best adapted to secure an honourable retreat for waning charms. Beneath the stern buckler of the deep stomacher it mattered not what kind of shape lay concealed, for all were reduced to the same level. Beneath the stiff diamond-shaped cap, closed carefully between the edge and the temples with gold tissue, it was all one whether the hair was thick or thin, black, red or white, for none at all was seen. The high make of the dress on back and shoulders covered what might be very beautiful in the bride, but prevented a deal of rheumatism in the matron. The modest and becoming partlet—a kind of habit-shirt made of good stout opaque materials—filled up the space the gown left bare, and buttoned high up the throat with embroidered collar or frill. The handkerchief, fastened upon the back of the cap in odd clumsy folds which puzzle costume-hunters to account for, could be let down, as it had been generally worn in the previous reign, snug and warm round the shoulders and kept out many a draught. The sleeves were full and close down to the wrists, with a ruffle half covering the hand, while all tell-tale outline was effectually stopped, as in Holbein's drawing of the buxom old Lady Butts, by a short mantle edged with fur. The cap more especially favoured those whom nowadays we consider the worst treated. The decided colours of its materials, the jewels along the border, and the gold tissue often interwoven with scarlet threads, enlivened the duskiest complexion, while the stiff angular forms relieved the hardest features. The mask of the face stood out sharply defined but well supported. The profile told nobly. The side of the cap descending along the cheek assisted to give the perfect oval in the young and to conceal that junction between the throat and jaw-bone on which time is most legible. Altogether it was a head-dress too old in itself for anyone to look very old in it. In this costume we see much to account for that peculiar truthfulness in Holbein which to our view so amply compensates for the absence of the laxer graces of a later period. With forms so settled and rigid no latitude was left to a painter. All ages looked stiff and decorous alike, or if they did not it was no fault of the dress.

Christian Art in the East and West of Europe.

There can be no doubt that the exportation of books adorned with Byzantine miniatures by the early missionaries, who carried Christianity and a degree of civilisation to the northern and western countries, supplied the original types from which, however barbaric the imitations, the first attempts were made to rival in the extreme west the arts and spiritual graces of the east. Some of the leading distinctions between the Byzantine and Latin (that is, between the eastern and western) modes of working out religious conceptions were that, in the western or Latin mode, symbolism was universal, the art of the catacombs was followed distinctly, though frequently remotely developing itself in mythical and sentimental forms and systems of parallelism between type and prototype. In the Greek Church the exposition of faith, through art, took a more tangible form. Symbolism was avoided on all possible occasions, and the direct representation of sacred themes led to a partial transfer, to the representation of the adoration due to the thing represented. Iconoclasm was the reaction of this abuse. In the advanced periods of Greek art this realistic tendency led to a painful view of the nature of religion, more particularly in connection with the martyrdom of saints and the physical sufferings of our Saviour and His followers, which are frequently represented in the most positive and often repellent forms.

Gainsborough and Cozens.

Gainsborough unwittingly set the fashionable world agog after style; but he did not enter the lists as a teacher, nor would he have allowed youth, who had advised with him upon art, to waste their time in attempting to learn what no one could teach. The copyists, or rather dabblers in his new style, were full-grown amateurs, polite idlers at Bath, who vainly fancied, forsooth, because this rare genius could, by a sort of graphic magic, dash out romantic scraps of landscape, rural hovels, wild heaths and picturesque groups of rustics, that they had but to procure his brown or blue paper, and his brushes and pigments to do the like. They had, however, in their egotism forgotten that Gainsborough had cultivated his natural taste for painting by an early and sedulous study of its principles, and that he commenced by drawing every object in nature compatible with his choice of composition, with the accuracy even of the Flemish and Dutch masters. Indeed his

early studies of trees, shrubs, weeds and even all the expletives of pastoral scenery were as faithful to their prototypes as those from the pencil of Wynants himself, whose works Gainsborough held in high estimation. The Gainsborough mania was long the rage; beaux and belles of *haut ton* were stricken with this sketching frenzy. Cozens was another who flourished at Bath. He, although an artist, was no Gainsborough, and only claims a notice for having too successfully practised upon the credulity of the amateurs of style, who frequented that fashionable resort of wealthy listlessness. Will it be believed hereafter that a professor of painting should undertake to splash the surface of a china plate with yellow, red, blue and black, and taking impressions from the promiscuous mass, on prepared paper, affect to teach his disciples—and those persons of education and elegant minds—to work them into landscape compositions? This, however, he attempted, and the charlatany succeeded, for he had a host of scholars for several seasons, who rewarded him most munificently for his wonderful discovery.

Proportion of Interiors.

Beauty and harmony of proportions depend very much upon the particular purpose for which an apartment is intended, and also upon the particular character aimed at. Even loftiness and lowness of proportion are not necessarily either a merit or defect, as their being so depends in very great measure not only on the nature of the apartment itself, but also on the architectural treatment of it. Whether in interior or exterior design, it is requisite that the individual features should be not only well proportioned in themselves, but so well balanced and adjusted that the *ensemble* shall at once produce a pleasing impression upon the spectator, which kind of *eurythmia*, or general harmony of proportions, admits of so many modifications, and depends so greatly upon the precise nature and character of the particular design, that direct precepts avail but little towards its attainment, on which account it must be acquired chiefly by taste guided by study and observation.

Landscape Art.

The principal art of landscape painting consists in conveying to the mind the most forcible effect which can be produced from the various classes of scenery, which possesses the power of exciting an interest superior to that resulting from any other effect, and which can only be obtained by a most judicious selection of particular tints and a skilful arrangement and application of them to difference in time, seasons and situation. This is the grand principle upon which pictorial excellence hinges, as many pleasing objects, the combination of which renders a piece perfect, are frequently passed over by an observer because the whole of the composition is not under the influence of a suitable effect. Thus a cottage or a village scene requires a soft and simple admixture of tones calculated to produce pleasure without astonishment, awakening all the delightful sensations of the bosom without trenching on the nobler provinces of feeling. On the contrary, the structures of greatness and antiquity should be marked by a character of awful sublimity suited to the dignity of the subject, indenting on the mind a reverential and permanent impression, and giving at once a corresponding and unequivocal grandeur to the picture. In the language of the pencil, as well as of the pen, sublime ideas are expressed by lofty and obscure images; such as in pictures, objects of fine majestic forms, lofty towers, mountains, lakes margined with stately trees, rugged rocks and clouds rolling their shadowy forms in broad masses over the scene, much depends upon the classification of the objects, which should wear a magnificent uniformity, and much on the colouring, the tones of which should be deep and impressive.

Murillo.

The characteristics of Murillo, about which there can be no mistake, are soon stated; he was not only a naturalist but biassed throughout by that spirit of localism and preference for his own particular province which forms the second nature of the true Spaniard. Andalusia, cheerful as its sun, and Seville, the city of Astarte and Figaro, are stamped on all his works; the hierarchy of heaven is anthropomorphised into a Bætican form; the type of his Virgin, lovely indeed, that Jews may buy and infidels adore, is the still existing maiden of Triana; his apostles and saints are her still existing parents, nor could any one glance at his masterpieces in the Seville convent of Capuchins without seeing in the Cicerone monk where the artist looked for a model, and how true the copy. The unchanged originals of his pauper groups, full of fierce, eager, southern life, still swarm in like manner about every church door on the Guadalquivir, and them we shun as much as we seek their portraits; his refining pencil has made them, as Cervantes did honest Sancho, company for duchesses. In a word, nature was his guide; all that the Creator made was good in his eyes, and he feasted on pulpy, throbbing, living realities, rather than the dry bones of the dead and gone; his mingling of ordinary humanity with the supernatural, the

haughty with the humble, wealth with poverty, health with sickness, beauty with ugliness, heightened effect by contrast and fixed faith in spectators; the truth of every accessory—all, to the utter contempt of geographical and chronological proprieties, being local in colour, form and substance—confirmed the belief of legends and dogmas to which they were associated, and the masses chimed in with transcripts wherein they and their nature and daily life were faithfully mirrored. But the tastes of the people are carried out by the genius of Spain whenever it is genuine; thus her ballads, owing nothing to art or "concetti," but all to truthful nationality, breathe the loves, the camps of real soldier life, and come home to every Castilian heart, and thus Murillo appealed to that of the Andalusian. The tastes and capacities of those immediately about him were what he consulted, and to which he lowered his loftiest aspirations. His holy families are not glorified forms which compel us to bend the knee, but pleasing scenes of domestic life where the gambols of charming children delight affectionate parents, and it is to the dear sympathies which they awaken in all that they owe their enduring vitality and increasing fame.

Magnitude in Art.

There is a certain maximum of magnitude to everything, either in its genus (if it is a work of nature) or (if it is a work of freedom) in its design and in the limits which ultimate causes prescribe to it. We apply this measure of magnitude with more or less consciousness in every apperception of objects; but our perceptions are very different, according as the measure which we consider ultimate is more or less contingent or necessary. If an object surpasses the conception of its generic magnitude it induces astonishment to a certain degree. We are surprised and our experience is enlarged, but so far as we take no interest in the object itself, the only result is this feeling of surpassed expectation. We deduced that measure only from a series of experiences, and there is no necessity that it should always be adequate. If, on the contrary, a production of freedom surpasses the conception which we formed from the limitations of its causes, we shall already experience a certain admiration. Here it is not only surpassed expectation which surprises us in such an experience; it is at the same time a divestiture of limits. In the former case our attention was only confined to the product which in itself was indifferent; in the latter we are attracted by the reproductive power which has a moral relation, or rather a relation to a moral being, and must then necessarily interest us. This interest will increase in the same degree as the power which constitutes the active principle is nobler and more important, and as the limit which we find surpassed is more difficult to overcome. A horse of unusual magnitude will agreeably surprise us, but still more so the strong and dexterous rider who manages him. Now if we see him leap with this horse over a wide and deep ditch we are astonished, and if there are hostile ranks into which we see him spring, respect is united with this astonishment, and it passes over into admiration. In the latter case we consider his action as a dynamical magnitude, and apply our conception of human bravery as an unit of measure where it depends upon our own feeling and upon what we regard as the extreme limit of valour.

Grecian Art.

"In beauty," says Lord Bacon, in his essay on that subject, "favour" (or "form," as we should now say) "is more than colour, and decent and gracious motion is more than favour. This is the best part of beauty, which a picture cannot express, nor the first sight of the life." Grace, then, being beauty in motion, and time being the "measure of motion," and time and space being, as to their metaphysical character, analogous, we shall be justified in using the word harmony in its original and more extended signification, in expressing by it, that is, not the mutual relations of objects in space only, or what in music is harmony properly so-called, but the relations of sequence or succession in time also, or what in music is called at the present day melody; and we think it reasonable to assert that, in this wider employment of it, the term harmony can be applied to the beautiful, not only as we perceive it in space and in a state of repose, but also as it comes before us under the conditions of time and motion, when we distinguish it as the graceful. Thus the carved or undulating line, to which the name of the "line of beauty and grace" has especially been given, is one which we follow with the eye from end to end. We might define it—and the same definition would suit the sequence of a musical air—as "unity in progression." And thus a flower and a tree, of which the outlines mainly consist of flowing or curved lines, as the harebell or the willow, are confessedly graceful. Thus the dance also is graceful; and the verse in Wordsworth, "She seemed as happy as a wave that dances on the sea," suggests the closeness of its analogy to the flowing or undulating line. So, when Virgil describes birds singing, and Lucretius the motion ("decent and gracious") of the clouds in heaven, they use language so similar that the one might almost have been

suspected of having copied the other. "Æthera mulcebant cantu" is the expression in Virgil applied to the birds' music. "Aëra mulcentes motu" is the singularly beautiful and poetical expression applied in Lucretius to the clouds' movement. He is speaking of the drifting of the clouds over the face of a clear sky.

Cutting off Gas Supply.

SIR,—It is a well-known fact that the escape of gas has a large effect in the spread of fires, and from a report appearing in a recent number of the *Daily Mail*, Manchester is the only city which appears to have undertaken to cut off the gas supply, and they do this by a stopcock in the pavement.

I have a method to accomplish this which is at once very effective and also quite simple, and it would be, if adopted by the various authorities, both insurance companies and municipal authorities, a very great preventative of the present danger and waste of gas.

Can any of your readers help me in this by bringing it under the notice of any gentleman who could influence its adoption, if he was satisfied with and approved the method?—Yours faithfully,

A. G. BELL, Builder and Contractor.

92 Sherwood Street, Nottingham:
December 5, 1897.

GENERAL.

A General Meeting of the Royal Institute of Painters in Water-Colours, Piccadilly, was held on Monday, when the following artists were elected members:—Mr. J. Gülich, Mr. Mortimer Menpes, Mr. Dudley Hardy, Mr. Charles Sainton, Mr. W. W. Collins and Mr. David Green.

The Secretary of the Institution of Civil Engineers has addressed a letter to the secretary of the "Senatus Academicus" of Edinburgh University, in which it is stated that, at the instance of Professor Armstrong, the council of the Institution have ordered that the degree of Bachelor of Science in Engineering of the University of Edinburgh shall be held to exempt candidates who apply for election into the Institution from passing the examination prescribed by the council for applicants for associate membership.

An Exhibition of about 400 photographs for the archaeological survey of the British Isles is now open at the Camera Club. Among the contributors are Messrs. Bolas & Co., J. Bulbeck & Co., Welsh, Scamell, &c.

The Memorial of R. L. Stevenson will probably be a monument inside St. Giles's Cathedral, and another in the open air, probably on the Calton Hill, Edinburgh.

A Meeting was held at Wakefield on Tuesday to receive the report of the committee appointed in October to promote a memorial to the late Bishop of Wakefield. A report was received from Mr. Pearson, R.A., in which he recommended that Wakefield Cathedral should be enlarged at an estimated cost of 20,700*l*. The report was adopted, and it was also decided that a memorial window should be provided by children.

A Statue of Henri Heine has been commissioned from M. Hasselrijs, of Rome, by the poet's sister, Mdme. Embden, and will be placed at Heine's grave in the cemetery of Montmartre.

The Château Achilleon, which was erected for the Empress of Austria in the island of Corfu, is about to be sold. The numerous works of art in the building have been sent to Vienna.

A Meeting of the Northern Architectural Association will be held on Wednesday next (15th inst.) at the Art Gallery, Newcastle-upon-Tyne, when Mr. Wm. S. Vaughan will read a paper, entitled "Some Notes on the Construction of Steel Girders and Columns." The lecture will be illustrated by means of models and blackboard sketches.

The Decoration of St. Paul's has cost already about 120,000*l*., and will require 100,000*l*. for completion. The collection at the bicentenary service on the 2nd inst. produced 809*l*., and some definite panel or portion will be assigned by Sir W. B. Richmond and the decoration committee to the Freemasons.

Mr. Octavius Hansard, architect, was killed at the Portland Road station a few days ago. He was seventy-one years of age.

The Architect.

THE WEEK.

THE need for more precise definitions in the Building Act of 1894 will not be diminished by the decisions which were given a few days since in the Queen's Bench Division. Two cases came up on appeal. One, London County Council v. Rowton Houses, raised the question, What is a public building? and although a decision was given, it was not precise or comprehensive. As an institution Rowton House is deserving of admiration; but we cannot see why it should be exempt from the conditions that are imposed upon ordinary lodging-houses all over the Metropolis. By the Act a house must not be less than 20 feet from the centre of a street. Rowton House being erected on the site of old dwelling-houses, every inch was utilised, and the frontage came closer than 20 feet to the roadway. When the owners were summoned the magistrate held that it was a public building and not a dwelling-house, and that the words of the Act, "No dwelling-house to be inhabited or adapted to be inhabited by persons of the working class shall, without the consent of the Council, be erected or re-erected within the prescribed distance," did not apply to buildings in such places as Churchyard Road, Newington Butts, but to buildings in narrow alleys and courts. The summons was accordingly dismissed. Mr. Justice HAWKINS considered that as there was no provision for wives or families, Rowton House could not be considered as a dwelling-house for the working classes. His Lordship held there was a probability of its being a public building, and dismissed the appeal of the County Council. Mr. Justice CHANNELL thought it might be a dwelling-house although it was a public building, but otherwise he agreed in the dismissal of the appeal. The definition in the Act says that among public buildings may be an hotel, lodging-house, home, refuge, or shelter which contains more than 250,000 cubic feet or has sleeping accommodation for more than 100 persons, but as there was no such building as Rowton House existing at the time, the hotels and shelters contemplated must have been of a different class.

THE second case also turned on the word "dwelling-house." A man named DAVIS was desirous to take down a row of old buildings in Brick Lane, consisting of shops with living-rooms, and to erect new shops with rooms over them. But he wished to occupy the whole of the site which he possessed. He erected one house, which he let, and his tenant sublet the rooms to families of the working classes. The County Council contended that it must be treated as a "dwelling-house" inhabited or adapted to be inhabited by persons of the working class, and summoned the owner in order to have the house set back. The magistrate held that houses for the working classes meant model dwellings which should be specially constructed. Mr. Justice HAWKINS adopted that view, and maintained there was nothing to show that anything more than a shop and dwelling-house was intended. Mr. Justice CHANNELL went into the subject at some length, and said that when a building was intended for the working classes there must be special construction and air space. The appeal in that case also was dismissed. From the judgments it would appear that special construction can constitute and cannot constitute a working-class dwelling under the Building Act.

WE mentioned last week that M. HASSELRIS, of Rome, was commissioned to prepare a statue of HENRI HEINE, which is to mark the poet's grave in the cemetery of Montmartre. It is the second time the sculptor has received such a commission. There is now a statue by him of HENRI HEINE in the villa in Corfu which belongs to the Empress of AUSTRIA, who is one of the most enthusiastic of the poet's admirers. Germany has no memorial of him except numerous editions of his books. Accordingly a statue was prepared for presentation to Düsseldorf, where HEINE was born on December 13, 1799, or, as he used to maintain, on January 1, 1800. When the statue was ready Düsseldorf was in anti-Semitic throes, and the gift was

rejected. Neither Mayence nor Frankfort would accept the memorial. It was then purchased by the Empress, and despatched to her "Achilleion." But as the villa has been abandoned, who can say what is to be the fate of the statue? It may eventually find a refuge in London, the city which HEINE abhorred.

At the ordinary meetings of the Society of Arts which will be held after Christmas, the following papers will be read:—"The Protection of Industrial Property," by J. F. ISELIN; "The Projection of Luminous Objects in Space," by ERIC BRUCE, M.A.; "Aeronautics," by Captain B. BADEN-POWELL; "Stage Mechanism," by EDWIN O. SACHS; "The Recent History of Papermaking," by CLAYTON BEADLE; "The Preparation of Meat Extracts," by C. R. VALENTINE; "Children's Sight," by R. BRUDENELL CARTER, F.R.C.S.; "Fireproof Construction of Domestic Buildings," by THOMAS POTTER; "Compensation to Workmen," by A. D. PROVAND, M.P.; "The Production of Low Temperatures," by Dr. CARL LINDE; "The Cinematograph," by JULES FUERST; "The Present Condition of the Sugar Industry," by T. R. TUFNELL; "English Art in Illuminated MSS," by Sir E. MAUNDE THOMPSON, K.C.B.; "Renaissance Woodwork in England," by J. HUNGERFORD POLLEN; "Recreations of an Indian Official," by the Right Hon. Sir MOUNTSTUART ELPHINSTONE GRANT-DUFF, G.C.S.I., C.I.E., F.R.S.; "The Plague in Bombay," by HERBERT MILLS BIRDWOOD, C.S.I.; "India and Sir Henry Maine," by CHARLES LEWIS TUPPER, C.S.I.; "Glass Painting," by LEWIS F. DAY.

THE forty-fourth annual general meeting of the Society of Engineers was held on December 13, at the rooms of the Society, 17 Victoria Street, Westminster, S.W. The chair was occupied by Mr. George Maxwell Lawford, President. The following gentlemen were duly elected by ballot, as the Council and officers for 1898, viz.:—as President, Mr. Wm. Worby Beaumont; as vice-presidents, Messrs. John Corry Fell, Henry O'Connor and Charles Mason; as ordinary members of Council, Messrs. James Patten Barber, Joseph Bernays, George Burt, David Butler, Percy Griffith, Richard St. George Moore, Nicholas James West and Maurice Wilson; as hon. sec. and treasurer, Mr. Perry Fairfax Nursey; as hon. auditors, Messrs. Alfred Lass, F.C.A., and Samuel Wood, F.C.A. The proceedings were terminated by a vote of thanks to the President, Council and officers for 1897, which was duly acknowledged by the President.

At the meeting of the Sheffield Society of Architects and Surveyors on Tuesday, Mr. F. R. FARROW lectured on "The Warming of Public Buildings." He described the various methods adopted in the warming of public buildings, first of all treating the hot-air systems, and the objections to them; then the general principles and methods of heating by low-pressure warm water and high-pressure hot water, together with their respective advantages and disadvantages, describing in detail the arrangements and materials of the pipes used in each case. The lecturer also dealt with the different methods employed in the use of steam for heating public buildings by means of low pressure, high pressure, and exhaust steam, with the merits and defects of each, pointing out the various classes of buildings to which these methods are especially applicable. Each system was shown to have its own particular merit and peculiar suitability to certain classes of buildings, and it was pointed out that there is no one system which is universally superior to all others, nor even successfully applicable in every case. Having dealt with general principles, the details of various fittings and apparatus were explained, the several types of radiators and their methods of employment, the different kinds of boilers with the particular purposes for which they are best suited, the forms and uses of stop-valves, steam traps and other minor but important features. Questions involved in the calculations necessary to determine the heating power and apparatus required for different buildings were then explained, and the criterion of efficiency determined. The lecture concluded with an exhibition and explanation of plans, showing the heating arrangements successfully adopted in some modern public buildings.

JOHN LOUGHBOROUGH PEARSON.

THE Bishop of CHICHESTER lately described Mr. PEARSON, who died on Friday last, as one of the most eminent architects in England. Dr. WILBERFORCE was, however, afraid to say that Mr. PEARSON was the architect who was to carry out the restoration of one of the towers of his cathedral. The circumstance is remarkable, but at the same time it recalls the architect. Mr. PEARSON had been in practice for over fifty years, and yet outside the circle of his clients and friends he was almost as unknown as if he were without a name or a history. An incident which was related on the occasion when Mr. PEARSON obtained the gold medal of the Institute will suggest the peculiarity of his position among his contemporaries. Mr. WHICHORD, the then president, said he overheard a conversation between two architects who were discussing the bestowal of the medal. One of them complained that the gold medal was to be given to a man of whom nobody had ever heard and whom nobody knew, while the other maintained that his only claim to the medal arose from being a member of the Council. It seems incredible that such ignorance about so able an architect should have prevailed in 1880; but if it were not for the controversies concerning some of Mr. PEARSON's restorations he was as likely to be as unknown to the profession in 1897 as in 1880. Comparatively few were acquainted with his skill as a designer, and consequently it was supposed he was one of those architects who kept a "ghost." That was a manifest absurdity, for gentlemen who possess secret auxiliaries can take a prominent part on the professional stage before the eyes of the world. It might even be said that the attacks which were made upon his schemes of restoration derived some of their force from the fact that to the majority of his countrymen he did not appear to be an architect who was much practised in construction. Every artist should at least be allowed the liberty to follow his own rule of life and to develop his powers without becoming the victim of adverse comments.

Although he was commonly supposed to be of Scottish extraction, he belonged to a family who lived long in Durham; but he could be claimed as a Belgian, for he was born in Brussels in 1817. He entered the office of IGNATIUS BONOMI, in Durham, when he was a boy of fourteen. Afterwards he served as an improver in SALVIN's office in London; then he became an assistant to PHILIP HARDWICK, R.A., by whom he was employed on the new hall at Lincoln's Inn. HARDWICK was more of a Classicist than a Mediævalist, and the former influence was exercised on Mr. PEARSON. He believed in rules and precedents, and the objection which has been made to his churches arose in a great measure because they were not free and independent examples of Gothic. He preferred measure to freakishness, and consequently his buildings were overlooked.

At the time he started there seemed to be a fair field open to him. PUGIN was then exercising his utmost power and he believed in the ability of Mr. PEARSON. The church of Holy Trinity, Westminster, which was Mr. PEARSON's first work in London, was constantly visited by PUGIN in his latter days, and was considered by him to be in advance of contemporary buildings. There are many critics who prefer St. Peter's, Vauxhall, which is an excellent example of a brick church for a district where economy must be supreme. Still more remarkable is St. Augustine's, Kilburn, which is familiar to most provincial architects who have visited London, for it is generally one of the first buildings sought. Mr. PEARSON's church of St. John, in Red Lion Square, reveals his skill in dealing with a difficult site. BERESFORD HOPE, who was one of the most absolute and kindest of judges, was not altogether satisfied when he found that for a time Mr. PEARSON was attracted by French Gothic of an early type, but the architect, he said, remembered he was an Englishman, and in the Kilburn church he added nerve and force to a French type, which made the style assume something of a nineteenth-century character.

Mr. PEARSON could not be always satisfied with his churches. He considered he was at his best when designing towers and spires, and it was rarely he was able to command the funds which were necessary for the realisation of those parts of a design. The tower of St. Peter's, Vauxhall

is a feature in the district, and stands out with remarkable force above the sordidness of its surroundings. The commission for Truro Cathedral gave him an opportunity such as is obtainable by few architects. SCOTT's only cathedral is in Edinburgh, and BURGESS's in Cork. Mr. PEARSON was hampered at Truro by the difficulty that the services in the parish church which stood on the site could not be suspended. He was able to obtain excellent stone, and the parts which are finished prove that the building, if it should ever be completed, will from its grace, religiousness and simplicity be worthy of its purpose. The total cost was estimated at the modest sum of 105,000*l.*, while the building is as large as Ripon, Rochester or Southwell. In 1870 Mr. PEARSON was appointed architect to Lincoln Cathedral, in which he carried out some important work. His skill and knowledge were also invoked by the authorities of Rochester, Chichester, Gloucester, Bristol and Exeter cathedrals. His restoration of a part of the west front of Peterborough Cathedral called forth the severest criticism, but what has been done is not so transforming as was anticipated. He was also entrusted with the restoration of Westminster Hall, and if the result is not altogether satisfactory, it should be remembered that he had to carry out the suggestions of a Parliamentary committee. At Westminster Abbey he took up the restoration works of Sir GILBERT SCOTT, and he rendered service to that noble building by opposing schemes which would deprive it of much of its interest. He erected churches in different parts of the country and restored others, and in all of them he was equally conscientious. He was indifferent if his work did not appear remarkable to critics, and he was not ambitious to gain a reputation for innovations. He was no less happy in designs for domestic buildings. Quar Wood shows French influence, but it is sufficiently characteristic to be introduced by Mr. EASTLAKE in his history of the Gothic revival. Lechlade Manor House is more English in treatment, while the Astor office on the Thames Embankment is French rather than English. He added a wing to King's College Library, Cambridge, where he had to connect a Classic with a Gothic building.

Mr. PEARSON was a notable instance of what can be done by perseverance and self-reliance. He was only twenty-four when he started in business, and all his mastery of Gothic detail was acquired by careful study of buildings. He owed nothing to the Oxford archaeologists or the Cambridge Camden Society, and it could not be claimed that he gained anything from membership of architectural societies. Yet he was a successful architect, although the number of his commissions might not equal those given to SCOTT and STREET.

In 1874 Mr. PEARSON was elected an associate of the Royal Academy, and in 1880 he attained full honours. He is succeeded by his son, who assisted his father in his later works.

STAINED-GLASS WINDOWS.*

WHILE it is easy enough for most people to obtain a notion of the history and the process of painting on walls, panels, canvas or paper, there are few who are able to do so much when the painting is on glass. It would appear as if the difference of material had changed what was a pleasure into a task which is almost beyond the powers of an amateur. But in glass painting more depends on the materials employed than in the other varieties of painting. Sculpture might also be included with painting. The kind of canvas does not much affect the nature of the painter's work, and in modern times a model is supposed to be equally well adapted for reproduction in marble or bronze. But in glass painting whatever is employed has its rights; there is as it were a sort of rivalry between the materials, and the character of the work depends upon the extent to which the conflicting rights are respected. It would not, for instance, be considered absurd for windows without any touch of painting to be produced in a manufactory of glass paintings. Very effective windows can be made by the use of coloured glass alone. Some of the most beautiful windows in Europe are

* *Windows.* A Book about Stained and Painted Glass. By Lewis F. Day. London: B. T. Batsford.

made up mainly of fragments of unaltered glass, the painter's work being found only in places where it was necessary to give definiteness. A modern student or amateur cannot help being puzzled when he sees or is told of this peculiarity. He asks himself, Why should perfection be a result of a primitive condition of manufactures? If the Mediaeval glass-makers were able to turn out as large sheets as are obtainable to-day, would they have been content with a system of design which is based on small fragments? He would find many artists to argue with him that superior work, and of a class more in keeping with the century, can be produced when larger pieces of glass are employed and when the painter's colouring is preferred to the glass-maker's. The questions of size and quality of glass necessarily involve one no less important, viz. that of leads. Just as there can be a window glowing with colour without any help from a brush, there can be another which depends for its patterns entirely on the leading. Is the glazier who lays down the leads to be considered an artist, or as no more than a necessary evil that should be only sparingly utilised? Problems like the foregoing have to be determined by every one who wishes to understand the history of stained-glass, but they are considered as almost beyond the capabilities of amateurs, and as a consequence few people who are not incited by necessity care to make a serious study of stained-glass in England. We may imagine the art to be a state in civil war, for varieties of glass, leads and paints appear to be in conflict to attain supremacy, and whoever claims to possess knowledge must take sides with and against some of the combatants. According as he is a painter, decorator, chemist, or mechanic, his position will be chosen.

Mr. DAY has not been classed among Gothicists, for in his ornament he endeavours to be as modern as possible, but the early glass workers would claim him as a brother craftsman. He is emphatic in his praise of their work; he endeavours to place himself in company with the glaziers and painters of successive generations and to explain the stages of that evolution in which they were unconsciously engaged. Mr. DAY is so absorbed by the work of ancient artists he has not a word to say about his own, and his book is on that account, as on others, unique in treatment. For him there is no detail in glass-painting which is trifling, and he explains processes with an amplitude which should be enough to reveal the mysteries of the art to the dulllest pupil. The author is so full of his subject as to exercise a sway over the reader, and thus his book when taken up through duty will be read for the pleasure it imparts.

Mr. DAY believes that "coloured glass was probably first made only in imitation of precious stones, and being made in small pieces, it had to be set somewhat in the manner of jewellery." This theory governs all his criticism. It is for its resplendence as a mass of illuminated precious stones, rather than for its story or for its worth as an archaeological record, he prizes a window. No one would wish to mix pastes with jewels, and in the same spirit in almost the last lines of the book Mr. DAY protests against the ordinary process of restoration, saying:—"Better than what is called restoration, the brutality of the mason who plasters up gaps in the clerestory windows of great churches with mortar, or the plumber's patch of zinc which temporarily at least keeps out the weather and the crude white light, leaving us in full enjoyment of the colour and effect of old glass." We cannot have jewels of colossal size, for the best attempts to rival paintings in foreign glass, although they possess excellent qualities, are not such "traps to catch sunbeams" as the oddly-shaped fragments in the old windows. They obscure the light rather than enclose it. In proportion to the number of pieces which it was considered desirable to introduce was, of course, the quantity of the metal strips which held them in position. The leads do not find universal approval, and as a rule nobody cares to see the mechanical aids to beauty in form. M. LASTEYRIC suggested, from his experience at St. Denis, that leading had a chromatic effect, and preserved the value of the tones employed by the painter, for he found that without leads as an intermediary, flowers which were painted yellow became red. He believed that leads increased the energy of sombre parts and "compromised the *clat* of the luminous parts." Mr. DAY's conclusions are similar:—

The leads, were they never so objectionable, are actually the price we pay for the glory of early glass. It is by their aid we get those mosaics of pot-metal, the depth and richness of which to this day, with all our science of chemistry, we cannot approach by any process of enamelling. Moreover, though merely constructional leads, taking a direction contrary to the design, may at times disturb the eye (they scarcely ever disturb the effect), they add to the richness of the glass in a way its unlearned admirers little dream. Not only is the depth and intensity of the colour very greatly enhanced by the deep black setting of lead, a veritable network of shade in which jewels of bright colour are caught, but it is by the use of a multiplicity of small pieces of glass (instead of a single sheet, out of which the drapery of a figure could be cut all in one piece—the ideal of the ignorant!) that the supreme beauty of colour is reached. Examine the bloom of a peach, or of a child's complexion, and see how it is made up of specks of blue and grey and purple and yellow amongst the pink and white of which it is supposed to consist. Every artist, of course, knows that a colour is beautiful according to the variety in it; and a "ruby" background (as it is usually called), which is made up of little bits of glass of various shades of red, not only crimson, scarlet and orange, but purple and wine colour of all shades from deepest claret to tawny port, is as far beyond what is possible in a sheet of even red glass as the colour of a lady's hand is beyond the possible competition of pearl powder or a pink kid glove. Not only, therefore, were the small pieces of glass in early windows, and the consequence, leads, inevitable, but they are actually at the very root of its beauty, and the artificer of the dark ages was wiser in his generation than the children of this era of enlightenment. He did not butt his head against immovable obstacles, but built upon them as a foundation. Hence his success, and in it a lesson to the glazier for all time, which was taken to heart by craftsmen even of a period too readily supposed to have been given over entirely to painting upon glass.

Mr. DAY admits that the mosaic windows, with their almost cumbrous bonds of metal, are rather barbaric, but he asks pertinently, "Might it not be said that in all absolutely ornamental decoration there is something barbaric?" EMERSON would have answered the question in the affirmative, for has he not said that the finest art of a race is attained soon after they emerge from the state of barbarism? The craftsmen could not remain content with cutting and trimming the glass which was provided for them. The glassmakers, by the discovery of the process of flashing, enabled the artists to produce new effects, and windows became allied to cameos and sgraffiti. By that means it was, among other advantages, no longer necessary for robes to appear as made out of unadorned textiles. The work of the embroiderer could be imitated, and the vestments of saints appeared to be of golden and silvern tissues. The process was simple, for lines which could not be formed with a pencil were attainable by the aid of a sharp-pointed instrument. The Swiss especially were enabled to produce most delicate results.

Then came the discovery of enamelling, which must have been considered as the means of endowing glass-painters with a new power. They were no longer confined to a few colours and a mechanical process of scraping or scratching. Depth and vigour were obtainable beyond the dreams of the illuminators. The artists could not have foreseen that so many of their finest effects were destined to succumb to the assaults of time, while the simple surfaces of their predecessors defied all its efforts. As Mr. DAY says, "Enamel was never of any great use in glass-painting, and it led to the degradation of the art to something very much like the painting of transparencies, as they are called, on linen blinds." But as the world seems to become more and more indifferent to the future, it is not likely that enamelling will ever be set aside through apprehension about its durability.

The glass-painters would have been more than human if they had resolved to keep to the old traditions. They were enabled to surpass the work of the wall-painters, and it would be too much to expect them to practise continual self-denial. If people in those days could have sought only for chromatic effects, there would be less temptation to painters, but always "stories" appear to be indispensable. There were vast numbers of pictures in churches, as well as carvings, which represented scenes in bible history or in the lives of saints, but the craving was for more of the same sort, and windows which could be made delightful without introducing the human figure became mere supplements to

frescoes and pictures which were visible elsewhere. On the walls or in an easel picture the painter could represent a scene as his imagination created it; in the window he was under restraints and was compelled to respect them. But his patrons were to be satisfied, and it is no wonder he endeavoured to emancipate himself from restraints. The glazier, who appeared to have him in thrall, could not be accepted as a friendly aid, and consequently metal-work was diminished, concealed and made to assume a form which was not suggestive of its importance. One of the consequences was the adoption of leads in straight lines, which expressed plainly that the glazier's co-operation with the painter was in a humble capacity and could not be considered as more than a mechanic, like that of the men who laid tiles or bricks without attempting to shape them in any way.

Subjects themselves, says Mr. Day, it has been explained, came to be glazed as much as possible in rectangular panes; but it marks, it may here be mentioned, a decline of design, as well as of technique, when these came in any way to interfere as they did with the drawing. Having made up his mind it is to be glazed in rigid square lines, the artist should logically have designed accordingly. He had only to mark off the glazing lines in his cartoon, and scheme his composition so that it was not hurt by them. Towards the seventeenth century the plain glass, the extra part beyond the canopy or beyond the picture, would often be glazed in some simple pattern. That, you might imagine, stood for the window behind the picture or the monument. At the church of St. Jacques, Antwerp, above a picture of the Circumcision is a canopy leaded in squares and painted to look like falsehood, beyond which clear glass is glazed in a pattern.

It is always an advantage for a student of stained-glass to begin with the glazing, and if he can form a diagram of the leading he will soon find that the qualities of the window are more easily manifested than appear at first sight. But a novice must not suppose that he is to accept any arrangement of lines as a model for imitation. To prize them for such a use would be as absurd as the imitation of a surveyor's triangulation under new circumstances. The designer cannot, however, ignore leads, and their treatment must be one of the first considerations when he prepares a cartoon. It is not advantageous to make more use of the metal than is absolutely necessary in order to emphasise the archaicism of his treatment.

It may be asked, If precedents are not to be exactly followed in leading, are they to be also modified before adoption in regard to other qualities? That is a question which is never likely to be answered in the same way by all who have interest in windows. As many of the windows in Glasgow Cathedral were produced under the direction of Mr. WINSTON, we suppose that in an archaeological sense they are correct. We have never discovered anyone who could stand long enough before them to examine the details, with the exception of one of the guardians of the buildings, and as he was employed on them in his youth his critical powers were defective. But while such works remain, it is evident there can be fidelity to ancient examples without the least power of expressing the spirit of ancient work. The Glasgow windows are object lessons to all who wish to realise what should be avoided in stained-glass, if it is to become a source of joy to beholders. The makers probably were compelled to think so much about archaeology they could not give any attention to colour. Yet to modern observers it is colour which fascinates, for few have the time to follow out the details of a "story" which could be far more clearly told in black and white on paper. If Mr. DAY's advice is followed, there will be fewer examples of the Glasgow species:—

The problem is how to produce the best glass we can in harmony with the architecture to which it belongs, but without special regard to what happens to have been done during the period to which the architecture of the building belongs. We may even inspire ourselves at the sources of sixteenth-century Italian art, and yet in no wise follow in the footsteps of the glass-painters of the period, who were more or less off the track. We may set ourselves to do what they did (glass was not their strong point), but what they might have done. There, if you like, is an ideal worthy of the best of us. If we pretend to be craftsmen we must do our work in the best way we know. If we are men let us at least be ourselves. Let us work in the manner natural to us. If we undertake to decorate a building with a style of its own, let us acknowledge

our obligation to it; let us be influenced by it so far as to make our work harmonious with it—harmonious, that is to say, in the eyes of an artist, not necessarily of a savant. Evidence of modernity is no sin, but a merit in modern work. To see how a man adapted his design to circumstances not those of his own day gives interest to work. We never wander so wide of the old Mediæval spirit as when we pretend to be Mediæval or play at Gothic. True style, as craftsmen know, consists in the character which comes of accepting quite frankly the conditions inherent in our work.

The last extract will suggest the frankness of the author. He is throughout a craftsman addressing those who aspire to be like himself, and is as communicative as they desire. Whatever is said has some relation to production. The book is therefore a complete course of instruction for incipient glass-painters, but it will be also a guide to all who have to decide upon the character of proposed windows. Amateurs who have been scared by the difficulties of the subject will discover that it is possible to obtain enough knowledge to enjoy windows by a simple perusal of the pages. The volume is larger than Mr. DAY's other books, but there is enough information in it to afford material for two or three works on stained-glass.

DISTRIBUTION OF ELECTRICAL ENERGY.

THIS subject was brought before the Northern Society of Electrical Engineers by Mr. C. H. WORDINGHAM, A.M.I.C.E. (city electrical engineer, Manchester), in a paper read on November 8. The paper is a very long one, but it is one of considerable interest.

At the commencement there is a general reference to the alternating *v.* continuous current controversy of a few years ago, and it is said that "it is impossible to force an unvarying system on varying conditions," but the paper is one which appears to us the opposite of this statement. The points which are given as having completely altered the comparison between the two systems are:—Improvements in consuming devices and the cheapening of the supply have caused the intensity of the demand; that is to say, the quantity of energy demanded per mile of main to become already very great, and in the near future there can be little doubt that it will be enormously increased, while at the same time the area to be supplied has been increasing to a great extent. We thus see that the problem has shifted from the grounds it originally stood on, viz. small compact areas and large scattered ones, to the ground of a large fairly dense area, with various kinds of demand in the different parts.

The paper lays down the suggestion that for practically all purposes continuous are superior to alternating currents, and further, that wherever there is likely to be any large demand, continuous currents should be used. Mr. WORDINGHAM, however, says with regard to this that he only refers to the distributing mains, and by so doing he disarms a great amount of criticism. The continuous current system is defended on the grounds that it is the most suitable for arc lamps, for motors, electroplating, charging of secondary batteries, and electro-chemistry from the consumer's point of view. From the central station point of view it admits of the use of accumulators direct on the mains, causing a better regulation of pressure; it also allows of the choice of any system of mains, while alternating currents do not, and there are troubles with terminals owing to vibration. Meters are more accurate with continuous current, especially when motors are used.

The paper also contains a further condemnation of single-phase alternating currents, and the opinion is expressed that they will disappear entirely. We think that this is going rather too far, but there is no doubt that multi-phase currents will do much of the work now carried out by the single-phase currents.

The next point touched on is that of the system of mains. The pressure of supply is discussed, but from the central station point of view entirely, and it is decided that the highest possible should be used consistent with safety and the Board of Trade regulations. It is also confidently stated that high-voltage lamps are perfectly reliable. We would here mention that if high-voltage lamps are efficient, then low-voltage lamps may be much more efficient, and if the high-voltage lamps are cheap, the low-voltage can be

much cheaper, and the same considerations apply to the life of the lamps.

The merits of two, three and five-wire systems are discussed. It may be of interest if the principles of these systems are given here. The original low-tension system introduced for electric lighting was the 100 volt two-wire. If the voltage is doubled, however, *i.e.* to 200 volts, only half the current is required to transmit the same amount of energy. Further, the cable need be only half as large allowing the same drop of pressure, while, if the same percentage drop is allowed, it need only be one-fourth as large, *i.e.* with the same loss of energy in the mains. We thus see that when the pressure is doubled only one-fourth of the copper need be allowed. The object of engineers is, therefore, to increase the voltage as much as is possible with safety, to reduce capital outlay. The Board of Trade specify the maximum pressure which may be used on the mains as 450 volts. Further, except by special consent, the pressure on any pair of consumer's terminals may not exceed 250 volts. A 440-volt two-wire system is thus, it would appear, the best for a medium-sized town; but this is not allowed at present, and if it were there is no commercial 8 candle-power 440-volt lamp made, and, further, if it were it would be expensive and probably inefficient. For these reasons three wires are used—the pressure between Nos. 1 and 2 being 220 volts; Nos. 2 and 3, 220 volts; and between Nos. 1 and 3, therefore, 440 volts. As the current flowing through Nos. 1 and 2 is in the opposite direction to that in Nos. 2 and 3, there is no current in No. 2 wire if the lamps on either side of the system are equal, as they neutralise each other; the middle wire may therefore be made quite small, in fact, only large enough to carry the current for any lamp on one side in excess of that on the other. By this means the cables are designed for 440 volts, while 220-volt lamps may be used.

To further increase the pressure Dr. HOPKINSON introduced the five-wire system, in which the two extreme conductors are at a difference of pressure of 440 volts, there being three intermediate wires, the pressure between each pair being 110 volts. Within the last two years 220-volt lamps have been greatly improved, and the five-wire system is converted into a three-wire system with 220 volts between each pair of wires. As before mentioned, the 220-volt lamps are still rather more expensive, less efficient and have a shorter life than the lower voltage lamps. However, the advantages to the supply authorities are so great that these disadvantages may be more than counterbalanced by the lower price of electricity rendered possible. The five-wire system, which is only used at Manchester, is advantageous, as it allows electricity to be supplied at 100, 200, 300, or 400 volts, whichever suits the purpose best; while the 200 volts is rather high where, say, only two arc lamps are required, there being over 100 volts absorbed in resistances. The five-wire system is, however, not likely to be adopted now that 200 volts may be used.

The difficulty of the balancing consumers is a great drawback to 3 and 5-wire systems, as it causes bad regulation of pressure on consumer's terminals. The details of the balancing question are not, however, of general interest.

A great point is made by the author on the question of standardising in these matters. There are at present in use on supply mains, 100, 105, 110, 150, 200, 210, 220 and 230 volts, and these entail special lamps, specially-wound motors and meters; and in alternating stations there are periodicities varying from 40 to 120 per second, each of which requires special motors, &c., as well as meters. The result of all this is that lamps and other apparatus are dearer than would be the case if, say, three pressures were used, 100, 200 and 400 volts.

For the lighting of a city the question of the distributing network is here gone into very fully, and the author is on the whole strongly of opinion that several separate networks, each connected direct to the central station with separate feeders, should be used, the networks being interconnected at a few convenient points, in which interconnectors there are automatic switches which open and isolate any network on which a fault appears. The fault can then be burnt out from the central station without affecting the rest of the networks. It is also an immediate indication of the district in which the fault has occurred. This system has, however, not been

adopted entirely as yet in Manchester, owing to the fact that the good automatic switch or cut-out has not yet appeared. The advantage of one large interconnected network over separate smaller ones is that in the event of the demand being underestimated in certain streets the drop in pressure on the main will be smaller than if isolated, as the neighbouring network will help to supply the current. The use of fuses in street boxes is strongly condemned, and we entirely concur in this condemnation, as there is no means of finding out which fuses have and have not blown except by examining each box. The author also recognises that the size of distributor put down must be guessed at, and cannot be calculated. The best method is to have standard sizes of main, say $\frac{1}{16}$, $\frac{1}{8}$, $\frac{1}{4}$, $\frac{1}{2}$ square inch section, and when in doubt use the next larger size. It is stated that distributors when once laid should never need enlarging, and we again agree with the author.

The rest of the paper is taken up with questions concerning the various kinds of cable and systems of laying.

The author, in his choice of systems of mains, *viz.* the drawn-in system for feeders and the built-in for distributors, confirms the best practice on this subject. Feeders have no joints and T-connections, and can therefore be drawn out and in without interfering with any other wires; and for this reason the drawing-in system is recommended. With distributors, however, the number of service connections and joints makes it impossible to draw out the cable; so no good object is served by having a drawn-in system. The author also insists that every cable in a drawn-in system should be in a separate duct, and with this we agree, as any one defective cable cannot affect another.

When Mr. WORDINGHAM goes on to the built-in systems, we think he is hardly so sound in his reasons or results. In the first place, he shows a strong bias towards bare copper mains, and in the second place he strongly condemns the paper and jute insulated lead-covered cables. Now as far as experience has gone, the bare copper has been almost always a failure, and the paper and jute insulated lead-covered cable a success. The author also has a great leaning towards the Callender built-in system, where the cables are embedded in a mass of bitumen which excludes damp. There is no doubt that this system is a good one, but it is not the only good one, and lead-covered cables have proved just as successful as it. The bare copper mains are described in great detail, which will not be of interest to the general reader; but the part with reference to the drawbacks of the system is worth repeating:—"The supposed drawbacks to the system are danger of flooding and liability to explosion of gas. As regards the former, it is difficult to see how the water could get in, but even if it did, it is unlikely it would reach the copper, as the culverts have all a fall of at least 1 in 100, and are connected to boxes at each end, all of which are drained to the sewers. Further than this, even if the copper were immersed, supposing the water to be pure, it is quite likely that it would be found to be feasible to continue running on the main until the culvert could be emptied." Now with regard to this, although the culverts may not get filled in Manchester, they do elsewhere, and also it is an experience that in a manufacturing town no surface water is ever pure enough to prevent very severe electrolysis. Further, there is always a possibility of a water main bursting, and ordinary town's water will allow of electrolysis. Again, it is the experience that once the insulators become wet, a film of hydrated copper oxide is formed over them which is conducting, and will allow electrolysis to continue till the positive wires become eaten away. Mr. WORDINGHAM is very fortunate indeed in not having the troubles which have condemned the system elsewhere. The author is also distinctly fortunate in never having an explosion in these bare copper culverts. Where the bare copper cannot be used Callender's solid system should be, according to Mr. WORDINGHAM, and a part of the remainder of the paper is taken up with an eulogy of them. We entirely agree with the author when he condemns the drawn-in rubber system, as the cables will not stand the wet and dry action met with, due to condensation if not leakage of water in the iron or even stoneware conduits. Details are then mentioned as to the laying of cables, painting of ends to indicate polarity, and the question of ventilating of

junction boxes. There is no doubt that with a drawn-in system the boxes should be well ventilated and drained.

The question of service lines is the next matter dealt with, and for this purpose we agree with the author that a flexible service should be adopted, owing to the confusion of pipes usually found outside premises; but we think that an armoured lead-covered cable laid direct in the ground is better than an armoured rubber cable laid in wooden troughs and surrounded with bitumen, as it is more flexible. With a drawn-in system there is an open connection between the consumer's premises and the main culvert, which allows bad smells to enter premises sometimes.

The paper concludes with an appeal for standardisation of main switches, fuses, meters and boards, with which we sympathise.

In conclusion, we would say that, although we cannot entirely agree with Mr. WORDINGHAM, there are many points and details discussed which are seldom considered in connection with the supply of electricity, and we have no doubt that the paper will prove a great addition to the subject.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Professor Aitchison, A.R.A., president, in the chair.

On the motion of the President the following proposal agreed to at the special general meeting of November 29 was confirmed, viz.:—That in order that the Council of the Royal Institute may remain in office until the close of the last general meeting in June of the year following that in which they were elected, the following alteration be made in By-law 30, viz. that in the last line but one of the final clause the word "last" be substituted for "first."

The President said it was his painful duty to announce the death of Mr. Octavius Hansard, who met his death under painful circumstances. Mr. Hansard was elected an Associate in 1848 and Fellow in 1860. Another loss was sustained by the death of Mr. J. L. Pearson, who was a perfect specimen of the English gentleman. His work was spread all over the country. His church at Vauxhall was remarkable for its brick vaulting. His restoration at Lincoln Cathedral was admired for its judiciousness. He was gold medallist in 1880. Votes of condolence were passed.

Mr. Emerson announced the death of Mr. W. Stephens Cross, elected Fellow in 1882, and Mr. Joseph Battye and Mr. Arthur James Forge, Associates.

Tests of Brickwork.

Mr. W. C. Street read the report on the third series of experiments conducted by the Science Standing Committee to ascertain the average strength of various descriptions of brickwork. The experiments were completed last spring by the crushing at the West India Docks of twenty short lengths of brick walls, each about 6 feet high by 27 inches long and 18 inches thick. The committee did not propose at present to give any fixed rules based upon the results or information gained by these experiments, as it was hoped that the Council of the Institute would sanction the preparation of a careful analysis of the facts contained in the three reports, and issue it in a suitable shape. If this were done it might be possible to generalise and formulate rules to govern the use of different kinds of brickwork as the supporting features of the structures erected under their superintendence. Meanwhile a few impressions could be given. The resistance of brickwork in lime mortar to crushing seemed to vary from one-sixth to one-eighth of the resistance offered by the brick itself, while in cement mortar it varied from one-half to one-fifth of that strength. So while cement mortar materially aided the weaker bricks in their combined strength, it could not materially affect the ultimate power of resistance in brickwork made of a harder variety. The different specimens in lime mortar and those in cement mortar showed comparatively little difference in the respective rates at which the beds were crushed, the only question was how long the bricks would be able to resist the pressure if the load were increased at these rates. The average thickness of the bricks was $2\frac{1}{2}$ inches and the total thickness of the mortar beds 6 inches, while the compression of the lime mortar beds averaged 1 inch, and that of the cement mortar beds about $\frac{1}{2}$ inch. This proved that the mortar generally was well crushed and disintegrated long before the final collapse of the several examples of brickwork. In dealing with the working load that might be calculated upon, care must be taken not to impose such a load as would materially damage the structure of the brickwork. At one-fifth of the crushing load the compression in lime mortar averaged $\frac{1}{3}$ inch in 6 feet of brickwork, and in cement

mortar it averaged $\frac{1}{4}$ inch. The great difference between dead and live loads must not be lost sight of. Taking a safe load as one-fifth of the crushing load, it might be assumed from the results obtained that in lime mortar stock brickwork is equal to about $3\frac{1}{2}$ tons, gault 6 tons, Fletton 6 tons, Leicester red 9 tons and Staffordshire blue 23 tons per square foot. In Portland cement mortar, 1 to 4, stocks would be equal to about 8 tons, gault 10 tons, Flettons 11 tons, Leicester red 17 tons, and Staffordshire blue 24 tons per square foot. Under the ordinary or average conditions of practice, the form of brickwork did not greatly affect the strength, the 18-inch square piers having given approximately similar results per square foot to those obtained from specimens 27 inches by 18 inches. With regard to the effect of age upon the different varieties of brickwork, results showed that, except in the case of blue bricks in cement, those built three months gave very similar results to those built five months. The difference in the case of the blue bricks was partly due to the fact that the bricks of which the specimens 27 by 18 were built were from a stronger lot than those of which the 18-inch square were built, the samples from each delivery falling respectively at 779 and 701 tons per square foot.

Appended were tables of results, showing dimensions, age and materials composing the piers, the pressure on gauge in pounds per square inch, the total real pressure in tons, the pressure per square foot of wall in tons, compression in inches, with observations on the varying conditions of the brickwork under increasing strains. There were also supplementary tables and formulæ by Professor Unwin, F.R.S.

A general description of the crushing of each pier was given to the meeting by Mr. Max Clarke, with the aid of several photographs which were, thrown on the screen by means of the lantern.

Mr. P. Gordon Smith said it was to be regretted that more money was not available for the expenses in the tests. He moved that the thanks of the Institute be passed to Sir William Arrol, Mr. Donaldson (engineer to the Dock Company) and the members of the committee who had taken so much pains to obtain satisfactory results.

Professor Unwin said the arrangements for the tests had been carried out by a sub-committee of the Science Standing Committee. There was really no report which could be called a report of the committee, it was only the report of two members. He was obliged to say these things because he was going to criticise. As this was the last of their reports he thought it rather a pity that some matters to which attention had been drawn last year had received no notice. He pointed out a year ago that in heading the tables there were many errors, and the way the report was put forward had completely thrown out the teaching of the results. He was told at that time some architects wanted the piers to be built in the ordinary way for the tests; they acquiesced in that, and the results were far from satisfactory. The second series of piers was then built. He understood that this time better sand was used than in the first test, although Mr. Max Clarke had said the same sand was used. The mortar undoubtedly was better than in the first series. When the third series was built, a quite new quality of sand was used in making the mortar; it was much better than that in the other tests. In this third report there was no reference made to these facts. He attached very great importance indeed to the mortar used. The difference was due almost entirely to the better quality of the mortar. Had the report gone before him, he would have said the committee was abdicating their office in not discussing their own results. The writers of the report were not, however, consistent, because they had drawn some conclusions. There was one point which he was sorry he had to explain. If the results were tabulated in a simple way, they would find the apparent anomalies between the tests were not so great. The results as shown were not absolutely irregular. It was obvious on the face of it that the whole of the piers in the second series carried nearly double the load of those in the first, a fact due almost entirely to the better quality of the mortar. The third series agreed almost entirely with the second.

Mr. William White thought the report did not make enough allowance in the ordinary work as to the stability and quality of the mortar, the quantity and mode in which it was made. In such tests it was necessary that all circumstances should be as near as possible to one another.

Mr. Wm. Woodward said Professor Unwin's criticism had confirmed the remarks made by him a year ago as to the unreliability of the reports. He was sorry the funds of the Institute could not secure a complete test, but he thought that, if appealed to, the members would readily subscribe a sufficient sum for a fourth and final test.

Mr. J. Douglas Mathews asked why the safe load was taken as one-fifth instead of one-fourth of the crushing load, which was the usual calculation.

The President, in putting the vote of thanks and closing the discussion, said it was a remarkable fact that such poor quality of mortar was used in the experiments. No architect

would think of using mortar that had two of sand to one of lime. Mortar with three of sand to one of lime was about twice the strength. The varieties in results of experiments must always be very great. He held the committee were quite right in having piers built in the ordinary way. No satisfactory results could be obtained if the piers were specially built for the tests. Attention was drawn to the question raised by Mr. Mathews.

Mr. Max Clarke said it was a fact that the piers for the first and second series of tests were built with the same quality materials. In the third series, however, Messrs. Cliff, who supplied the sand, ran short of the quality used in the former tests, and thus the experiments were completed with another quality sand not quite so good.

Mr. Street said that when the compression of the mortar had reached one-fifth they took that as the point at which they should estimate a safe load, namely, one-fifth of the breaking strain.

The President said they usually took the test as soon as it showed first signs of cracking, and one-fourth of that strain was considered a safe load.

ROYAL ACADEMY PRIZES.

ON Friday last the prizes won by the students of the schools of the Royal Academy were distributed by Sir J. E. Poynter, P.R.A. The occasion was remarkable, for the gold medal and travelling studentship for painting were for the first time not awarded. The subject assigned was "Cleopatra Clandestinely Introduced into the Presence of Cæsar"; but no one of the works submitted was considered worthy of the prize. The following prizes were distributed:—

Landscape painting, "An Afterglow," Turner gold medal and scholarship (50*l.*), Alfred Priest; landscape painting, "A Lock," Creswick prize (30*l.*), C. M. Q. Orchardson; painting of a figure from the life (open to male students only), silver medals, 1st Allan Douglas Davidson, 2nd Arthur Thomas Holloway; painting of a head from the life, silver medals, 1st Alfred Guy Smith, 2nd Edmund L. Van Someren; painting of a draped figure (open to female students only), silver medals, 1st Hilda Koe, 2nd not awarded; cartoon of a draped figure, "Hermione as a Statue—"The Winter's Tale," silver medal and prize (25*l.*), Mary Twogood; design in monochrome for a figure picture, "Jephthah Meeting his Daughter" (Judges, chap. iii. v. 34, 35), Armitage prizes, 1st (30*l.*) and bronze medal not awarded, 2nd (10*l.*) Ernest George Ellis; design for the decoration of a portion of a public building, "Spring," prize (40*l.*), Mary E. F. Brickdale; set of six drawings of a figure from the life (open to male students only), 1st prize (50*l.*) and silver medal Owen Baxter Morgan, 2nd (25*l.*) Ernest George Ellis, 3rd (15*l.*) George Murray; drawing of a head from the life, silver medals, 1st Francis E. Colthurst, 2nd G. A. Mott; drawing of a statue or group, silver medals, 1st Mabel Catherine Robinson, 2nd not awarded; perspective drawing in outline (open to painters and sculptors only), "An Interior View of the Entrance-portico of the Royal Academy, looking east," silver medal, no competition; composition in sculpture, "Charity," gold medal and travelling studentship (200*l.*), Alfred Turner; model of a design, "Gladiators Fighting," 1st prize (30*l.*) Gilbert William Bayes, 2nd prize (10*l.*) not awarded; set of three models of a figure from the life (open to male students only), 1st prize (50*l.*) and silver medal Alfred Turner, 2nd prize (20*l.*) Alfred Bertie Pegram; design for a medal, "A Design for a Cast Medal, obverse and reverse, in commemoration of Her Majesty the Queen's Reign of Sixty Years," silver medal, not awarded; model of a bust from the life (open to female students only), silver medals, 1st and 2nd, no competition; model of a statue or group, silver medals, 1st not awarded, 2nd Mortimer John Brown; design in architecture, "A Nobleman's Country House," gold medal and travelling studentship (200*l.*), A. H. Christie; set of architectural drawings, "The Library at Lambeth Palace," silver medals, 1st Arthur Maryon Watson, 2nd not awarded; set of architectural designs (Upper School), prize (25*l.*), George John J. Lacy; set of drawings of an architectural design (Lower School), prize (10*l.*), John Stevens Lee; plan of a building, "An Art Gallery for a Large Town," prize (10*l.*), Horace Charles Hide; original composition in ornament, silver medal, no competition; perspective drawing in outline (open to architects only), "The Chapter-house of Westminster Abbey," silver medal, no competition. The Landseer scholarships in painting and sculpture of 40*l.* a year each, tenable for two years, were awarded (in painting) to Edward Lawrence Van Someren and (in sculpture) to Alfred Turner.

The President, in delivering his address to the students, regretted that it should not have been found possible to present the gold medal for painting on this the first time he had had the pleasure of presiding during a gold-medal year. Painting had been from the beginning of the Academy, and always

would be, its main feature. Without making any comparisons between the three branches of art that this academy embraced, he thought it fair to say that painting was the art which appealed most widely and with the greatest force and directness to all minds; it was the most popular art both as regarded the numbers of those who practised it and those who enjoyed it, and as such it would always hold the principal place in their exhibitions and their course of study. Amongst the paintings in the gold medal competition were more than one which just fell short of the combined qualities that went to make a great work. He hoped the competitors would not allow their disappointment to discourage them from further efforts, nor was there any need to feel discouragement, for, in spite of the failure to gain the gold medal, there was promise that more than one of the competitors would achieve success in the future and take high place in the development—perhaps even in the history of the art of our country. The President warned the student against that crude and spurious realism which now tainted youthful effort, especially in the present decade, which has seen "the apotheosis of mere cleverness." Be satisfied that you have cleverness, he exclaimed; but do not show it; restrain and conceal it if you would become really great, for cleverness and technical excellence, when displayed as the end instead of the means of art, necessitates the absence of the artistic sentiment and of the higher capacity. The more the painting of your model is like your model the less it is like the character he is supposed to represent, and the more it departs from art. The apostles of realism and the hierarchs of technique always meet this great truth, not with experiment, but with a name in lieu of it, viz. Velasquez, who, if the truth be told, reached the astounding height he attained not by reason of but in spite of his limitations; only the commanding force of his genius compels us to pardon the shortcoming we do not find in Titian, in Rembrandt, his two great companions in the trinity of art. On the part of the student, therefore, the appeal to Velasquez is reduced to an evasion of the higher efforts. With only technique Hals could be vulgar and Rubens tiresome; but the possession of the other greater qualities could raise a modern—Ingres, to wit—nearly to the side of the great masters of the decadence, so exquisite is his drawing and so fine and lofty his sentiment. Referring to this master, Sir Edward Poynter said that had it not been for the indiscretion, or patriotism, of a French agent Ingres's masterpiece of portraiture would now be hanging on the walls of the National Gallery, instead of in the Louvre. The President urged upon his hearers not, in Sir Joshua Reynolds's words, to begin where the great masters left off, and reminded them that the wonderful technique to be found in Millais's best work—notably in "The Yeoman of the Guard" now at the National Gallery—was a technique slowly developed out of the intensely painstaking handling of his early days. He was glad to think that they would shortly in those rooms have an opportunity of surveying the whole life-work of Millais. Without entering in detail into the work done by the students, he thought that the subject of the cartoon of a draped figure was the best executed work he had seen turned out for a number of years by Academy pupils. The painting of drapery itself was comparatively easy of attainment, but the proper arrangement of drapery belonged to one of the most difficult departments of art. The compositions for the gold medal in sculpture were also excellent in design, but it was matter for regret that there had not been better competition in medalling. A number of the architectural drawings, too, were lacking in originality, and there was too much of that picturesque irregularity of architecture which appeared to have become the fashion of the day. As a final word he could but say that in every department there was evidence of zeal and painstaking energy, and he could only encourage the students to persevere, with the consciousness that in after years the exertions they put forth would meet with their due reward.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

A LECTURE was delivered by Mr. Sydney D. Kitson to the members of the above Society on Monday evening in the Leeds Institute of Science, Art and Literature, the subject being, "Some Byzantine Churches in Greece." Mr. George Corson (president) occupied the chair. Byzantine art, Mr. Kitson said, was connected with the youth of Christianity, and had maintained its traditions to the present day. Many lessons were to be learned from it—lessons of construction and design. He went on to describe some of the Mediæval churches of Greece, most of which, being small, had been almost entirely disregarded by travellers. The builders of the old Byzantine churches, Mr. Kitson remarked, did not strive after effect; they knew that by expressing themselves truthfully they would obtain a beautiful building.

NOTES AND COMMENTS.

M. REDON, the architect who is entrusted with the conservation of the Louvre, has prepared plans for the adaptation of the Pavillon Marson to a museum in which the collections of the Union des Arts Décoratifs can be exhibited. He proposes a large hall carried through two storeys, and which is to serve for temporary exhibitions. It will be surrounded by several small rooms, which will be assigned to different sections of the collection. The Pavillon itself will probably be devoted to the objects from the Garde-Meuble, which are sufficient to form one of the most interesting exhibitions of furniture. As the building will be lighted by electricity, the collections can be studied by designers and workmen in the evenings. The Union introduced the system of admission fees, which are not popular among visitors to French museums, and it is not unlikely the Government will insist on the collections being visible gratuitously on some days in every week.

ALL the treasures which were carried off by the armies of France from other countries a century ago were not returned after the downfall of NAPOLEON. The Monuments Commission have discovered one example which came from Coblenz, but not a word is said about its restitution to that city. It is a retable in gilded copper adorned with enamels, the subject being the Descent of the Holy Spirit on the Apostles. There is a Latin inscription in antique characters, being a verse from the Acts of the Apostles in the Vulgate, and from the style of the lettering it is evident that the work is Rhenish of the twelfth century. The retable was lately discovered in the sacristy of the Abbey of St. Denis, but it will not be allowed to remain there. It has been transferred to the Cluny Museum in Paris.

IT would be an advantage if the authorities in London and the principal provincial towns were to imitate the action of the Municipal Council of Paris. It is proposed that from January 1, 1898, a competition will be opened each year between the architects and the proprietors of the houses erected during the year in Paris. The proprietors of the six houses which are considered to be the best will be exempted from a payment of a part of the dues, or "droits de voirie," which are imposed on new buildings. A premium of 1,000 frs. will be awarded to the architect of each of the houses. The architects who wish to compete are to make application between December 1 and December 15 in each year. The jury that will make the selection will be composed of five members of the Municipal Council, the director of architecture of the city, the inspecting architect, and two architects nominated by the competitors. A nearly similar competition was arranged for the houses in the new thoroughfare, the Rue Réaumur. Only in that case four houses erected between January 1, 1896, and December 31, 1899, will bring premiums to owners and architects. The sums awarded are not very large, but it will be advantageous for an architect to succeed in the competition and profitable for the proprietors.

THE office of supervising architect for U.S. Government buildings is always held for no more than a brief period. About a month ago a Mr. TAYLOR obtained it, but already an attack is made on him on account of his politics. It is said that the candidate who stood first in the competitive examination was passed over because Mr. TAYLOR was considered a better Republican. That is one view, but there are others who say that Mr. TAYLOR is not a good Republican, but that he is a good Democrat, and his votes are referred to. In 1888 he voted, it appears, for Mr. HARRISON. In 1892 he did not vote, and at another time he preferred to give his support to Mr. CLEVELAND instead of to Mr. BLAINE. But if good Democrats are in favour among the Republican party, it is asked why Mr. AIKEN, who held the office, was asked to resign immediately the MCKINLEY administration came into power? A journal which supports Mr. TAYLOR says:—"As a matter of fact, the only recommendations which are known to have been sent to the secretary in his behalf while the three names were under consideration, and which could by any construction be placed in the category of political support, were a letter from Senator DAVIS, of Minnesota, who was an old personal

friend of the TAYLOR family, and another from Representative HARMER, of Pennsylvania, who represents the district of Mr. TAYLOR's present residence. Mr. HARMER, as the writer is informed, was not personally acquainted with the candidate, but knew him by reputation, and sent the letter at the suggestion of some of his acquaintances in Philadelphia, who thought that a line or two which would show how Mr. TAYLOR is regarded by his neighbours at home would be only proper. Senator DAVIS's letter was a statement of what he knew of Mr. TAYLOR as boy and man, his character and the stock he came from. If either the Senator or the Representative had been a Democrat, but had stood in the same relation to the candidate in other respects, he would doubtless have been asked to bear the same kind of testimony." Mr. TAYLOR served for two or three years under his predecessor, and apparently he is the right man for the office. But an American official cannot expect to enjoy a long tenure of any post, and it is evident that already a successor to Mr. TAYLOR is looming large before the wirepullers of Washington.

PHOTOGRAPHS of objects of architectural, archaeological, historical or ethnological interest, for the collection now being formed previous to being deposited in the British Museum, will be received by Mr. SCAMELL, architect, the curator *pro tem.* of the National Photographic Record Association. Only unmounted photographs printed in carbon, platinum, or other permanent process will be received, the standard size being whole plate. Contributions may be forwarded to Mr. SCAMELL, either at the Royal Photographic Society, 12 Hanover Square, or at 21 Avenue Road, Highgate.

THE restoration of the church of Llanbeblig, Carnarvon, has brought to light some interesting features. The interior was covered with mouldy plaster, and filled with pews and galleries of rotten deal, so that the existence of many relics was completely hidden. The church is dedicated to St. PEBLIG, and was the first in Wales to bear the name of a saint not admitted to the Roman Calendar. PEBLIG's date was about 450 A.D. It stands close by the old Roman Segontium, a heathen altar (probably from thence) having been found in the foundations of the nave. In the south transept is a tomb said to be that of CONSTANTIUS CHLORUS, father of CONSTANTINE THE GREAT, whose body was removed hither from York by EDWARD I. A fine altar-tomb in a side chapel commemorates Sir WILLIAM GRIFFITH, Kt. (1587), and a brass in the chancel (1500) one of the Ffoxwist family now extinct hereabouts. Amongst the coins found were a dupondius of HADRIAN (A.D. 117-138), and a denarius of MAGNENTIUS (A.D. 350-353). Two incised stone coffin lids, a quaint monumental effigy, a stoup, a piscina, a credence, and an aumbry have also come to light. The restoration has followed strictly the lines of the original work, and has cost 4,000*l.* The vicar has had to become personally responsible for the sum of 1,000*l.*

ILLUSTRATIONS.

CASTLE KEEP, REIGATE.—ENTRANCE FRONT. BILLIARD ENTRANCE HALL.

PRIOR to the alterations this house consisted of the ordinary inartistic type of dwelling, with a central entrance and narrow staircase hall, about 5 feet in width, with the reception-rooms to left and right, and in dealing with the property no little difficulty was experienced in turning a house of this type into an artistic home.

The alterations comprised the removal of the old front and rebuilding the new front about 6 feet in advance of the old line, and the removal of one of the side walls of the staircase hall to form a large entrance hall, which is used also as a billiard-room; also the rearrangement of the staircase and the addition of bay windows. The pitch of the roof was governed by the old slopes. The lower portion of the work is carried out in a warm-coloured red brick, the upper part being rough-cast and distempered, and the shutters and entrance door painted green.

THE PURCHASE SYSTEM AT SOUTH KENSINGTON.

IN the course of the exhaustive evidence given by Major-General Sir J. Donnelly, secretary of the Science and Art Department, before the select committee on museums, the following information was obtained about the procedure adopted when objects are purchased for the South Kensington Museum:—

Sir John Gorst: What amount of public money is spent in adding to each part of the museums under the Science and Art Department?—To begin with 1885-86, it was 1,200*l.*; then the next year, 1886-87, 1,500*l.*; 1887-88, 2,000*l.*; 1888-89, 2,000*l.*; 1889-90, 2,000*l.*; 1890-91, 2,000*l.* Then, 1892-93, it was 1,800*l.*; 1893-94, 2,000*l.*; 1894-95, 2,000*l.*; 1895-96, 2,000*l.*, and it was then reduced last year to 1,800*l.* Take the works of art in the same way, beginning with 1885-86, 10,000*l.*; 1886-87, 10,000*l.*; 1887-88, it went down to 7,000*l.*; 1888-89, 7,000*l.*; 1889-90, 10,000*l.*; 1890-91, 10,000*l.*; 1891-92, 10,000*l.*; 1892-93, 7,300*l.*; 1893-94, 10,000*l.*; 1894-95, 10,000*l.*; 1895-96, 10,000*l.*; and then last year reduced to 7,000*l.* Then there are certain other subordinate votes, such as reproduction of works of art, for the hire of specimens, photographing art objects, historical collection of paintings, exchange of works and the art library, preparation of catalogues, carriage of materials. The total cost of that for 1895-96 was 19,100*l.*, and for 1896-97 was 14,360*l.*, being a reduction of 4,740*l.* Then in the Geological Museum there is a small purchase vote which used to be 400*l.*; that had been so for many years; that was reduced to 240*l.*, being a reduction of 160*l.* last year. Then in the Edinburgh Museum, the purchases which had been, I think, for some time at about 2,600*l.* were reduced to 1,600*l.*; a reduction of 1,000*l.* In the same way Dublin Museum was reduced from 2,300*l.* to 1,400*l.*; that is a reduction of 900*l.* That made altogether a reduction last year in the science and art branches of 6,100*l.*; and in the new estimates for 1897-98 the 1,000*l.* for Edinburgh and 900*l.* for Dublin have been reinstated.

How are the art purchases made?—The Museum director and his staff when they have things offered to them make proposals for purchases.

In the case of art it is the director of art and his staff?—Yes; the director for art of the Department makes his comments. That is the rule, but it is not invariably followed. He has the right to make his comments on the proposal, and then, if the purchase is a considerable amount, or there is any reason for thinking that the lord-president or vice-president may require some further advice, some experts on the committee of advice of the Department are consulted, and they give their opinions. Then it comes before the vice-president or the lord-president for his sanction, except for purchases under 20*l.*, which the Museum director can purchase on his own authority.

The original recommendation for the purchase comes from the director of the Art Museum, Mr. Purdon Clarke, does it not?—Yes.

And that is referred in the first instance to the art director, to Mr. Armstrong?—Yes, as a rule; I think they generally talk it over.

The art director is an official of the Science and Art Department, who advises you upon matters of art, but has no special connection with the Museum?—Yes, his functions with regard to it are laid down very clearly in the paper which I circulated, as I understood all these orders were to be circulated. It is called Form No. 1,286. It says:—"All proposals as to the purchase or rental, whether of pictures or art objects generally, are to be brought before the Board by the secretary, and should be accompanied by a statement:—1. The vote under which they are proposed. 2. The amount voted for the year. 3. The amount remaining at the disposal of the Board for purchases; or, in the case of rentals, still free from liability for the year. 4. The name of the vendor. 5. The price at which similar purchases have been made. The Museum staff will report."

As a matter of fact, those are not brought before the Board, but are brought before the vice-president, are not they now?—Yes; at one time we often had boards at South Kensington; the lord-president, or the president, either singly or together, used to come and hold boards at South Kensington.

That has fallen into desuetude at present?—Yes.

Were the purchases always brought before the Board?—No; very often the papers, especially if there was any pressure about it, were sent to Whitehall. Of course the question of a Board is a matter of internal arrangement.

As a matter of fact, the purchase is originally recommended by the Museum art director, and is then commented upon by the art director of the Department?—Yes.

And is then submitted, with your observations, to the vice-president for sanction?—Yes.

He consults the lord-president if he pleases. It is left to him to consult the lord-president or not?—Yes.

Under what sum are purchases made without sanction?—20*l.*

The Museum director has power to purchase up to 20*l.* without sanction?—Up to 20*l.* without sanction; but he ought to consult the director for art about it. I do not know that he always does. Of course these are the general rules, but on many occasions they are not rigidly adhered to.

Then the Museum director and the art director, if they were agreed, could purchase without further sanction any object under 20*l.*?—Yes.

Now, will you tell the committee what you mean by the committee of experts that you said were taken into consultation sometimes? Who do that committee of experts consist of?—The original minute appointing these committees was May 9, 1882:—"My lords decide that for the undermentioned collections in the South Kensington and Bethnal Green Museums, there shall be a body of referees or advisers who can be consulted as to purchases, elimination of objects, cataloguing, general arrangements, &c., either singly or in committee, as the occasion may require; provided that there is always a meeting of each committee for general inspection of the collection with regard to which it advises once every year. This will not preclude the employment and payment of a specialist from time to time to carry on a definite piece of work." Then came a list:—"Art Museum.—Mr. G. F. Bodley, A.R.A., Mr. C. Butler, the Earl of Carlisle, Mr. Walter Crane, Mr. F. Du Cane Godman, F.R.S., Mr. J. P. Heseltine, Mr. W. de Morgan, Mr. A. Morrison, F.R.G.S., Mr. J. H. Pollen, Sir E. J. Poynter, P.R.A., Mr. George Salting, F.S.A., Mr. L. Alma-Tadema, R.A." Those are the present advisers. Then there are also committees for the Indian Museum and various other sections.

As a matter of fact, are those experts consulted?—I think at one time they were a good deal consulted; much depends upon who the Museum director may be. If the Museum director has been appointed from the point of view of administrative capacity, as, for instance, the late Sir Philip Owen was, these committees have to be more largely consulted than has been thought necessary when the Museum director was a man well known in the world as an art expert, as, for instance, the late Dr. Middleton. Therefore the art museum committee, which was very often consulted before Dr. Middleton's time, was very little consulted while he was the director. Since then I think we have had one or two meetings of the full committee; and, of course, at all times, even during Dr. Middleton's life, we consulted separate people on separate portions of the collection when purchases were to be made. For instance, in the case of purchase of tapestries, I remember that Dr. Middleton almost always got the late Mr. William Morris's opinion and put it with his own when he recommended a purchase. But, quite recently, when you, sir [Sir J. Gorst], had some doubts about purchases, you directed that the committee should be called together; and those purchases, and a number of others which were remaining with the Museum for consideration, were brought before the committee, and they reported to you what they recommended for purchase and what they did not.

Sir Henry Howarth: In the case of the purchase of pictures, have not living artists been consulted whose names are not in that list at all?—Yes; the President of the Royal Academy is almost always consulted when there is an important—

When there is a purchase of an important or expensive picture?—Yes; these purchases of pictures are a small thing, it is only 800*l.*, and it is left in the hands of the art director very largely. But when there is at all an important picture, he always brings it up with the advice or recommendation of somebody of that kind.

When you say that there is only 800*l.* for the purchase of pictures, is the estimate confined to 800*l.*?—Yes; 1,000*l.* it was, and it is now 800*l.*

Is that a separate item of the estimates?—Yes; historical collection and paintings.

In addition to the 7,000*l.*?—Yes.

It is now 800*l.*?—It is 800*l.*

But do you not sometimes buy pictures out of the 7,000*l.*; is not the 7,000*l.* applicable to the purchase of pictures also?—No, unless it is a purely decorative thing; some pictures have been purchased out of that in this way; some pictures have been purchased for their frames, which were very fine frames; the pictures went for nothing, and no doubt in that way some pictures have been purchased out of the 7,000*l.*

Mr. Acland: Of course you would not include copies of frescoes which are part of the Art Museum?—No, that comes under the head of reproductions; but when a thing is purchased as a picture it ought to be purchased out of the sub-head for pictures.

Chairman: Anything that remains unspent on March 31 is returned, is it not, to the Treasury?—Yes, this March 31; after that it will not be returned.

There is to be a new system?—It will in future be a grant in aid.

Do you think the existing practice, which is now to be altered, the practice of repaying into the Treasury, has ever led

to any recklessness of purchase towards the close of the financial year?—No; the fact is, we have always had more things to purchase than we had money to purchase with. What has happened, possibly, has been this, that we have found that there is perhaps 30*l.* or 40*l.* left, or something of that kind, and the objects that are down in the reception-room very likely are things for which they require 300*l.* or 400*l.* It is quite possible, then, that the Museum director may go off and see at the various dealers in London whether there does not happen to be a thing of about the price of the money he has which it would be desirable to purchase. Of course he would not buy it if it was not desirable to purchase it. But it would be a very strange thing if you could not find a desirable object for a museum or for circulation among the whole of the dealers in London for 40*l.* or 50*l.* Of course it has never been necessary to waste any money. I have never known any case, at all events.

Mr. Acland: But you have occasionally anticipated the money of the next year, have you not? I do not mean in a technical sense. I suppose some arrangement has been made by which part is paid in one year and part in another, in accordance with the regulation. I suppose that has been done?—That is so; and this alteration is an advantage in that way, because, as Mr. Acland will remember, we had considerable difficulty in purchasing a very valuable collection only a year or two ago, called the Peyre Collection.

From Paris?—From Paris; the gentleman did not understand the English financial arrangements. He would only sell the whole collection at once, *en bloc*, and we could not pay for it at all *en bloc*, and therefore we waited till the end of the year. We explained how it stood, and we had to make a definite separation of his collection for a certain sum and get a receipt for that. We could only say we would do our best to purchase the rest next year, but we could not promise. He took it in that way and the thing was left over till the next year. It unquestionably caused some negotiation.

Chairman: Now, is there any separation between the objects which you purchase for circulation and those which you purchase for permanent exhibition in London?—No. The theory is that any object that is purchased for the South Kensington Museum is, and shall be, available for circulation. Of course, some things that have to be stuck on to the wall cannot be circulated, but otherwise everything is supposed to be in theory available. As a matter of fact very valuable objects are not often sent away from London, though one or two of the most valuable things have on occasion been sent when there was some special exhibition. For instance, I remember the Soltikoff reliquary was sent to Birmingham a number of years ago, when they had a special exhibition there of enamels. But the very fine things are, of course, as a rule, not sent away from South Kensington. With regard to the other things, there is no doubt it often happens that when recommending the purchase, the art museum director, or Mr. Armstrong, has specially noted that the things would be useful in circulation, and those objects are no doubt very largely kept in circulation.

Are the objects for the Science Museum and for the other museums purchased generally upon the same principle?—Yes; the directors in Dublin and Edinburgh have a right of purchasing up to 20*l.*; but when an object is of a higher price they have to refer it to South Kensington.

Mr. Bartley: Then the general conclusion we come to, I suppose, is that taking the collections as a whole they have been extremely well bought, very economically bought, but there have been cases where mistakes have been made?—Yes, I believe they have been very well and very economically, many of them extraordinarily extremely economically, bought, and I believe, from all I have heard with regard to other museums, that there have been a few mistakes made at South Kensington as in any other public museum of the same size in Europe. I have talked to many of the directors of other museums, and they have all admitted that they are taken in at times.

Would you agree that it is a very important matter in the organisation of a museum that the purchases should be most carefully arranged for?—Yes, and I think the arrangements that now obtain are as good as we could well make them; nobody has suggested any better arrangement.

I should like to ask a word or two about the Art Library. Do you consider the Art Library a very important educational adjunct to the Museum?—Yes.

Did it commence its career about the same time as the Museum?—Yes, I think they began and carried on together; in fact, it is part of the Museum, because it is not only a library, but there are many drawings and bookbindings and things of that kind in the library. It is just one section of the Museum really.

And an important section. Are there the same rules for the purchase of books as for the purchase of museum objects?—Yes, it is not often that the purchase of a book comes up for decision by my lords; I mean there are not many books over 20*l.* in value.

Who recommends them?—That is done by the keeper in

charge of the Art Library consulting with the director; the director is responsible for all purchases.

Are all purchases made from South Kensington?—If they are more than 20*l.* they have to refer for sanction, but over and above that the directors of both museums in Dublin and Edinburgh very largely use the services or take advantage of the assistance and services of the staff of the Museum at South Kensington in telling them of objects for purchase and advising them. Whenever they see objects for sale in London that they think would be desirable for Dublin and Edinburgh they advise the directors of it.

For all practical purposes their superintendence is with you, but the detail carrying out is left very largely, I suppose, to the keeper or superintendent?—Yes, the director.

Lord Balcarras: Have you ever bought things for the Museum yourself?—I have sanctioned purchases.

Have you bought things?—No; well, wait a bit; no, I do not think I ever have.

You are not sure?—I remember now once, when I was abroad, buying a brass object at Venice for myself, and I thought I was bound to offer it to the Museum, and I am sorry to say they took it; but that is the only thing I ever bought for the Museum.

Is it possible for the secretary of the Department to buy for the Museum?—Oh, yes, it is possible; but, of course, he would naturally report anything of that kind he had done to the heads of the Department.

He is the head of the Department?—No.

Mr. Acland: He would not be likely to buy without the knowledge of the director, or talking it over?—No, I do not know of any case; the case I have mentioned was the only time I have ever bought a thing. I have sanctioned purchases that another recommended, and for instance, during the vacation and recess I have sanctioned many purchases, and at other times the director of the Museum and the director of art have come and said there was a sale going on at Christie's and it was advisable to buy so-and-so, and I have sanctioned their making the purchases up to a certain price, and then reported what I had done to the heads of the Department for their information.

Lord Balcarras: Supposing the director brings in some object, the secretary of the Department is practically entitled to say, "This shall be bought," or "This shall not be bought"?—The secretary, I take it, is chief of the staff, and it is his business to do on his own authority anything that he knows his chiefs would consider ought to be done. Sometimes he has to take the responsibility of acting on his own judgment before he can refer to those chiefs. He would be neglecting his duty if he did not take the responsibility on those occasions, when if he hesitated some things might be lost. As to refusing, I suppose I have an authority, I do not know that I have ever exercised it, that if the director of the Museum came to me and proposed certain purchases, and I thought them undesirable, I should tell him so. If eventually he still thought they ought to be purchased, I should pass the papers on to the heads of the Department, with my remarks on it, saying that I did not recommend it; but I do not remember anything of the kind having occurred.

You say it would be submitted to you, and you would state if you thought it desirable or not?—Yes.

Supposing the director of the Museum brings, we will say, a chalice to you, the cost is immaterial; he says, "I want to buy this;" I understand from your evidence five minutes ago that it would be in your province to say whether the object should be bought or not; the sole criterion would be the knowledge of art on the part of the secretary of the Department?—If I said that I did not explain myself thoroughly; what I said was that if I thought he was wrong I should tell him so, and we should discuss the matter. If he still thought it was a desirable purchase, I should submit it to the heads of the Department, and I should say, "I differ from the director for the Museum, and I think this is a case in which you had better call in some of the referees;" that is the course I should pursue. If, on the other hand, there was a pressure of time, and it was necessary to make the purchase straight off, and the director brought me a proposal to purchase sufficiently supported, and I, looking at it from the common-sense point of view, thought there could be no question on the matter, I should authorise him so as to prevent the object being lost, and I should report to the heads of the Department what I had done. I have done so on many occasions, taken the responsibility of acting for them.

For the heads of the Department?—Yes, when there was not time to refer to them.

In fact, without your official power it would have been impossible on certain busy occasions for the Department to have acquired certain art objects?—Yes, I acted for the heads of the Department, as they always authorise me to do.

In the beginning of your last answer but one you said, "If I thought the director of the Museum was wrong, we should discuss the matter." Assuming you have money to make the purchase, that means you would discuss the matter from an art

point of view; as to whether the object was genuine and would fill a particular gap, and so forth?—I would discuss it from the common-sense point of view.

I do not understand. When a chalice, the case I named, is brought to the Museum for purchase, good common sense, I have no doubt, is valuable in every walk of life, but is not something beyond common sense required to settle whether that particular object should be bought or not?—What I mean by a common-sense point of view is this, that if Dr. Middleton had said to me, "Here is a chalice of the thirteenth century, and I think it is a very valuable thing and perfectly genuine," I should never have dreamed of saying it was not a chalice of the thirteenth century, or arguing the matter on that head; I might, from the common-sense point of view, have said, "Well, you have spent a good deal of your vote this year on chalices" (if it happened to be so), "do you think it is really desirable?" And we should have gone further into the matter; but this is really a purely hypothetical business. As long as I have been secretary I have never had to give a direct opposition to the Museum director on the subject of any purchase, and I have never had to go to the heads of the Department and say, "The director of the Museum thinks one thing and I think another." It is really not a practical question.

During all these years you and the director of the Art Museum or the director of the Science Museum have always agreed upon the desirability of purchases?—Not at first, before we began talking about it; sometimes he has come and discussed the matter with me, but we have never come to direct opposition.

I ask this question because I see in one of the reports you gave us in manuscript, which has not been printed yet, it says that an object bought by Mr. Cole was removed as undesirable; I presume, therefore, it was within the province of the secretary of the Department to buy?—Mr. Cole was director of the Museum as well as secretary.

Then at that time the two offices were combined?—Yes.

I understand from your evidence that your sanction only is required for the purchase of art objects and not your direct initiative?—My direct initiative is certainly not required, but strictly speaking, where it is an expensive object, the sanction of the heads of the Department is required.

With regard to that point, you say when it is an expensive object?—I mean above 20*l.*; the director of the Museum on his own responsibility can purchase up to 20*l.*

"The Museum staff," I see in paragraph 23, on Form 1,286, "are authorised to make purchases of objects not exceeding 20*l.* in value"?—Yes.

That is what you said just now?—Yes.

Is not that entirely ruled by the following sentence—"But the science or the art director should in all cases be consulted before any purchase is made"?—As a matter of fact that has not been enforced; they have made lots of purchases without consulting the science and art director, but as a rule he should consult the art director.

In that case the Museum director has no authority to buy, not up to 20*l.* but for a guinea, without permission of the art director?—In practice that is not so.

These rules are not regarded then?—In practice they have not been carried out so strictly as they have been laid down.

As they are laid down I have read the rules very carefully. —I say they have not been carried out as strictly as they might verbally be construed.

In rule 23 I see:—"All purchases, whether they require Board sanction or not, are subject to the control of the secretary"?—Yes, absolutely as accounting officer.

Control means, you must sanction the purchase?—Whoever is accounting officer must have that power eventually; I am accountable for the money, and if they were to exceed their vote I should be personally responsible for it, and therefore I must have control.

Not on the expenditure of the money, but on the subject on which that money is expended?—I thought I had explained that.

ART IN CHURCHES.

A CONFERENCE, convened by the Clergy and Artists' Association, was held at Bishop's House, Kennington Park, on Friday last. The Association has for its object the raising of the standard of church decoration, and with that end in view it seeks to enable the clergy and others to approach the artist more directly, in the belief that the best work can come only from men whose cultivated talents give them the independent position of artists, and not from those who turn the supply of church decoration into a commercial pursuit. Sir W. B. Richmond, R.A., said that the movement which the Association was carrying on was, in his opinion, a very interesting one, and it was one which he had wished to see initiated for a good many years. He would warn its promoters that it was desirable to begin on a small scale and not to increase

their numbers too rapidly. They should, he thought, only admit into the Association people who were very much in earnest and be on their guard against commercialism, into which everything in England had a tendency to drop down with a rapidity which was simply appalling. In his view art in our churches ought to be an expression of our national as well as our religious life. It should express the thoughts that were moving in our own time, and some latitude in the choice of subjects might be allowed to the artists. He could not see why bad drawing was necessarily devotional. There were a large number of people who supposed that the pious picture or window or reredos must have a sort of mawkish sentimentality about it. He trusted that the Association would keep clear of this tendency, and would encourage that which was manly, and that which in the best sense was modern. There never was a time when people knew more of the heroism of Englishmen than now, when all interesting occurrences were reported in the newspaper press. Many of the heroic doings of our fellow-countrymen might well be pictured on the walls of our churches. The disaster to the Margate lifeboat was fresh in people's memory. The crew entered that boat with the knowledge that they were carrying their lives in their hands. Their occupation needed the display of just as much courage as, and perhaps more than, the courage shown by the early Christians in allowing themselves to be thrown into the arena at Rome. He thought that by taking such subjects as the Margate lifeboat disaster—he did not say that subject particularly—and picturing them in our churches we should make our art a national art. There were, again, many subjects in the Old Testament which had never been touched by the artist. For instance, almost the entire Book of Psalms and the Proverbs were rarely illustrated, though they would supply wonderful subjects which could be so treated that the roughest ploughman could understand them. With regard to technique, he would lay it down as an axiom that nothing painted on canvas should be applied to a wall. The greatest French artists had used canvas for the decoration of the Panthéon in Paris, but it must be recognised even by the artists themselves that the result was an entire absence of unity. The fact was that a picture painted on a canvas in a studio and stuck on a wall invariably looked like a picture, and this a wall decoration ought not to do. As to stained-glass windows, our present system was almost always wrong. In the thirteenth and fourteenth centuries stained-glass windows were made by a sort of travelling guild of men, who moved about from town to town, carrying their furnaces with them. Their glass was made close by the church for which it was designed, and it was put up and altered again and again until it was regarded as right. What happened now? A man in Yorkshire who wanted a window wrote to a firm in London, who sent it down without knowing a bit about the church for which it was intended, except, perhaps, that it was of brick or of stone. The stained-glass art was one of the most difficult arts in the world, and yet it was relegated to people who were not artists. For the Clergy and Artists' Association to succeed it must move with the broader thoughts of the time, it must be exclusive and not inclusive, and it must produce better workmanship than the firms were able to supply. It would do a great deal of good, however, if it put the firms on their mettle and made them employ serious artists instead of people whose business was to design for six days a week and seven hours a day, which no living man could do with satisfactory results. The Bishop of Rochester, after commending the work of the Association, remarked that, like Sir W. B. Richmond, he had been struck by the comparatively narrow selection which Christian art made from the great riches at its disposal. There was a great deal in the Bible that art could lay hold of to make its own.

ARCHÆOLOGY IN WALES.

AT the annual dinner of the Honourable Society of Cymmrodorion on Monday, Lord Justice Vaughan Williams, who presided, said that the first foundation of the Society was in 1751, and no one could doubt the great usefulness of such a Society, not only to members of the Welsh brotherhood and the larger Celtic family of nations, but also to every intelligent man, and especially to every scholar, archaeologist and philologist. The original Society in its progress acquired a high reputation and flourished for years, but broke down in an effort to accomplish a zoological work, somewhat outside its constitution; but, phoenix-like, a Society rose in its place in 1820, only to come to an end in 1843, when its books and papers were with thoughtful wisdom placed with the British Museum. If the Welsh library which he had heard talked of of late was established in London, as he hoped it might be, he should not be surprised if these Welsh archives found a more characteristic resting-place than the British Museum. They would always, however, be grateful to the authorities of that great institution for the scholarly care bestowed on the Welsh

archives while in their custody. In the year 1873 the Cymmrodorion rose again in the form of the present Society, and every member of the Society ought to rejoice at its present prosperity, and to expect for the Society a long and prosperous life. The last quarter of this century had seen a remarkable development, social and political, of Welsh nationality. The marvellous progress of Welsh education and the establishment of the Welsh University were some among the many instances of this national development. Then, again, there had been in the subjects with which the Society was more particularly concerned what would be called in the City "a boom," which, happily, had not been ephemeral, but had gone on for many years, increasing year by year in intensity. He spoke of the progress made in philology, ethnology and archaeology generally throughout the world—a progress not only in the quantity of work done and the number of researches made in new fields, but also a progress made in the character of the work. Scholarly, accurate collations of scientific facts and data worthy to form the basis of really scientific conclusions had been substituted in all these fields for the hasty selection of a few ill-verified premisses as the basis of conclusions, to which students of these subjects used often to be impelled by warm poetic imagination rather than the cold dictates of reason. Among the work done by Welsh scholars recently he might mention the "Record Series," published under the auspices of this Society, and to which members of the Society had so liberally contributed in purse and good work, as strong evidence of the excellent work which was being done. The necessity of this series, suggested by Sir John Williams, had been emphasised by the announcement that the Government declined to undertake the publication of any more purely Welsh records. There had already been published in this series Parts I. and II. of the "History of Pembrokeshire," edited by Mr. Henry Owen, and Part III. would shortly follow. Mr. Henry Owen had munificently presented to the Society not only his labour, but had placed at the disposal of the council a sufficient number of Part II. as he did of Part I. to enable them to give a free copy of the work to any member who might apply for it. There had also been published in this series the "Court Rolls of the Lordship of Ruthin," by Mr. Arthur Roberts, of the Record Office; and he was told that they might shortly expect in this series the following among other works:—"The Black Book of St. David's," by Mr. Willis Bund, and "The Catalogue of Welsh Manuscripts" in the British Museum by Mr. Edward Owen. Dealing with the materials at the command of the Welsh archaeological student, he showed that as to the period of Roman occupation the Rev. Hugh Williams, professor of Church History at the Theological College, Bala, had thrown some light on the history of the early British Church, and how far and how long the Christian Church in Wales down to the sixth century was the Church of the Romans themselves. The sixth century seemed to have been a period of vigorous national life, of religious and mental activity. It was the period of St. David, St. Sampson and St. Teilo, of the poets Taliesin, Aneurin and Llywarch Hên, and of the marvellous Celtic Christian mission which went so far towards Christianising the Northumbrian Cymri. But, curiously enough, from that time forward down to the end of the eleventh century, there seemed to have been a dearth of any manifestation of this national activity, mental or otherwise, and even with regard to the sixth century itself there seemed to be no contemporaneous evidences, and what evidences there were took the shape of later manuscripts purporting to embody the works of the great men of the sixth century, and could only be received subject to the severest literary criticism, especially when they came to manuscripts belonging to the end of the sixteenth or to the seventeenth century. On looking at the materials at the disposal of archaeological students it seemed to him that further materials might come to hand later, because he did not understand that the records at the Record Office had been examined except to a very slight extent. Again, the monastic records seemed to have disappeared in such a wholesale fashion that one could not help hoping that they might turn up hereafter in some place where they were sent for safety, possibly in the library of the Vatican or in the library of some Cistercian convent abroad.

GLASGOW ARCHITECTURAL ASSOCIATION.

A MEETING of the above Association was held in the rooms on Tuesday, the 7th inst., the president (Mr. W. T. Conner) in the chair, when Mr. Alex. Wingate read a paper entitled "The Architectural Treatment of Gables." The lecturer confined himself to treating the subject in a general historical manner, tracing the development of the gable through its different phases from the Greek tympanum to the variable quantity of the present day. After a discussion, in which several members took part, a hearty vote of thanks was passed.

COLOUR PHOTOGRAPHY.

AT a meeting of the Royal Photographic Society, held in the rooms of the Society of Arts on the 14th inst., Professor Gabriel Lippmann described his system of colour photography, whereby a photograph showing the colours of nature is obtained by a direct process and with one exposure of the plate. The film, which might be of any sensitive substance, he explained, was exposed, developed and fixed in the usual way. Two conditions, however, must be observed. The film must, in the first place, be transparent and grainless, and, in the second, it must be in contact with a metallic mirror during exposure. The effect of the mirror, which was formed by running a layer of mercury in behind the plate, was to reflect back the incident coloured rays and thus make the incident light waves stationary. These stationary vibrations, falling in the interior of the sensitive film, impressed their own structure upon it, and by virtue of the structure thus imparted to it the brown deposit of silver, when viewed by reflected white light, appeared clothed with the same colours as were possessed by the image in the camera. The colours were produced by "interference" in the same way as those of the soap bubble or mother-of-pearl. That this was their cause M. Lippmann said was proved by the fact that the tints of a negative changed if it were damped in consequence of the gelatine swelling slightly and thus altering the structure of the silver deposit. The colours produced by this process were true and bright, provided that exposure and development had been properly conducted; they were, moreover, completely fixed, and resisted the action of light and time. He had not yet succeeded in taking prints from his negatives, but was convinced that to do so would be found possible. In the course of the lecture a number of the results achieved by M. Lippmann were exhibited in the lantern, including coloured photographs of the spectrum, stained-glass, landscapes, fruit and flowers, and the portrait of a little girl. A reproduction of the spectrum of argon showed the characteristic lines of that gas in the most beautiful and distinct manner.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE first monthly meeting of this Society for the current session was held in the library at the Museum, Queen Street, Edinburgh, on Monday, Mr. J. Balfour Paul, vice-president, in the chair. The first paper, by Sir Arthur Mitchell, K.C.B., M.D., LL.D., consisted of a series of notices of facts or objects interesting on account of their bearing on the methods and conclusions of scientific archaeology. In the next paper Mr. F. R. Coles, assistant-keeper of the Museum, described a cyst with a double unburnt burial which had been recently discovered at Ratho Quarry. Mr. James W. Cursiter, F.S.A.Scot., contributed a notice of a stone with an incised cross, showing square, corded arms with circles at the intersections, and the two sides of the foot of the shaft ending in scrolls, which had been found on the site of the old chapel dedicated to St. Columba in Walls, Hoy, Orkney. Mr. T. N. Annandale contributed a note on the hammer-stone used in the Faroe Isles in the preparation of dye from tormentilla, two specimens of which were exhibited with melcather coloured by the dye. He also exhibited a Faroe bismar or wooden weighing beam, used like a steelyard, similar to those in the museum from Orkney and Shetland.

GLASGOW PHILOSOPHICAL SOCIETY.

A MEETING of the Architectural Section of Glasgow Philosophical Society was held on Monday in the rooms, 207 Bath Street. Mr. Macgregor Chalmers presided. Mr. Thomas Bonnar, F.S.A. (Scot.), decorator, Edinburgh, read a paper on "Notes on the Decorative Treatment of Interiors." At the outset Mr. Bonnar pointed out how backward we had been in this country in the use of colour both for external and internal decoration, and briefly referred to the probable causes. Amongst these he placed our climatic conditions, which he regarded as having had an undoubted influence on the national character. But now, while retaining the national individuality, we were in all the arts adding more of the warmth and brightness which come from contact with the larger world. The lecturer then referred to the picturesque in decoration, which he defined as akin to what architects call the accidental, and as the avoidance of mechanical uniformity of treatment; the seeking for originality, something unexpected and uncommon. He warned his audience, however, against the production of anything bizarre or fantastic. The decorator should only seek results which would arouse feelings of agreeable surprise and pleasure. Mr. Bonnar next dealt with the principles of decoration as applied to the adornment of our houses and public buildings, indicating some of the difficulties a decorator had to contend with, and the necessity for his seeking the highest development of his artistic sense, so that he might be saved from many mistakes in treatment.

After describing various styles of decoration as applied to the different parts of a room, the lecturer spoke briefly of ceiling decoration, arguing in favour of a return to the practice of painting these surfaces with form and colour, and thus an outlet would be obtained for the technical abilities of the rising school of decorative artists.

BYZANTINE ARCHITECTURE.*

WHEN Constantine the Great determined to make the ancient city of Byzantium the capital it was practically in ruins, and the style in which the city was rebuilt has been termed Byzantine. The Byzantine, the Venetian, the Florentine, the Lombardic and even the Norman may all be regarded as belonging to Romanesque architecture.

Byzantine architecture, as one of the subdivisions of Romanesque architecture, has peculiarities of its own. The style was developed from the Classical under the Byzantine Empire, or rather Roman Empire of the East, during the fourth and fifth centuries of the Christian era, and under variable modifications was used until the final conquest of the empire by the Turks in 1453. The style exerted considerable influence even in Italy as late as the fifteenth century, and it may be regarded as surviving still in Russian architecture and to a less degree in other Eastern lands.

An almost universal feature of the style in buildings of any pretensions is the incrustation of brick or rough stone-work with more precious material. Large spaces are left void of bold architectural features, to be rendered interesting merely by surface ornament of polished marble presenting natural beauty of hue, or of sculpture in very low relief, and confined in the main to vegetable or geometrical designs of clearly cut outline.

The style depends much upon colour for its effect and mosaics wrought on grounds of gold or of positive colour are profusely introduced. The leading forms which characterise the Byzantine style are the round arch, the circle, the cross and the dome supported upon pendentives.

The capitals of the pillars are of endless variety and full of invention; while some are plainly founded on the Greek Corinthian, many resemble those of the early round-arched Western architecture; and so varied is their decoration that frequently no two sides of the same capital are alike. The ancient basilicas of Sta Sophia in Constantinople and the church of St. Mark in Venice are classical examples of Byzantine architecture.

About the time of Constantine a number of general laws were imposed upon all architects throughout the Roman world. But after the capital had been transferred to Byzantium the bonds of tradition relaxed, and the Oriental taste which had introduced at Rome the employment of mosaics and coloured marbles again rose into the ascendancy and proportions were sacrificed to masses and beauty of lines to conspicuousness of ornaments. Somewhat later a new style of architecture came into vogue, which, without inventing anything, changed everything. Taking up what was exceptional at Rome, namely, the cupola, architects forthwith made it the chief feature and best known character of their art. Persian influence, it is supposed, had something to do with the development of this particular style which for the want of a more appropriate name was called Byzantine, and of which the church of Sta Sophia at Constantinople remains the greatest model.

At the present day there remains no trace of the first Sta Sophia, built in the fourth century by Constantine. After having been frequently burned, it was totally reduced to ashes in the year 532. Justinian caused it to be rebuilt by Anthemius de Tralles and Isidorus de Miletus. Ephesus, Palmyra, Pergamos and a multitude of other cities and temples were despoiled to enrich it, and furnished to the architects columns of porphyry and granite which were prodigally lavished upon its interior. Ten thousand workmen were employed in the construction of its brick ramparts, vaults and mosaics. Its peculiar beauties were such that notwithstanding the mutilations to which the Turks subjected it in 1453, we can still appreciate the proud exclamation of Justinian, referring to the temple of Jerusalem, "Solomon, I have surpassed thee."

The proportions of Sta Sophia are by no means gigantic. It measures only 266 by 248 feet. Its exterior is somewhat naked and is disfigured by a number of buildings which hide the general outlines. Between the buttresses—raised by Amurath III. to sustain the walls shaken by successive earthquakes—tombs, schools, baths, stalls, &c., are crowded.

But putting out of consideration this confusion and forgetting the four hybrid minarets with which conquerors have flanked the great mass itself, the spectator cannot but admire the beautiful curves of the apse and the central cupola, whose elliptical shape exaggerates its size. Two long covered porticoes lead up to the church, the second of which communicates by

nine gates with the interior. So soon as he enters the building the visitor takes in at a glance the entire conception of the architect, and is forced to render homage to his genius, which, casting aside the restriction of the Classic school, combined in such perfect accord the circle and the straight line.

Around the basilica, up to the height where the vault springs, are vast rows of seats supported by richly decorated circular galleries. Nothing can equal the majesty of these porticoes, in the Corinthian capitals of which animals, allegorical figures and crosses are interlaced among the foliage.

Sta Sophia has lost all its ornaments. The iconoclastic zeal of the Moslem has left it nothing but its precious pavement which was always concealed under carpets. The statues have been removed. The altar, made of an unknown metal which was a mixture of gold, silver, bronze, iron and precious stones welded together, is now replaced by a slab of red marble.

Of the mosaics on a gold ground with which the building was at one time enriched only the four gigantic cherubim have been preserved, but the heads of these figures are concealed under a rose of gold, the reproduction of the human face being a horror to the Mussulman. At the end of the sanctuary may be perceived the lines of a colossal figure which time has not yet obliterated. This represents Sophia, the goddess of wisdom and patroness of the church, who, under her semi-transparent veil, looks down upon the ceremonies of a foreign worship.

In the church of Sta Sophia the long naves which characterised the basilican churches of the Western Empire are metamorphosed into a series of square chambers surmounted by cupolas. Here the proportions of the antique basilica are altered and lost, but great beauties make up for the loss. The boldness of the cornices, the powerful relief of the supports, the pendants and corbels which connect the square nave with the circular cupola, the unity of the whole edifice, all parts of which bear upon the central mass, supporting and sustaining it, are the chief features of Byzantine art and make it both original and captivating.

The barbarity of the capitals in which the Corinthian acanthus degenerates into a meagre fillet, the strange mixture of figures in mosaic on a ground of gold which replace the breathing sculptures and the delicate ornaments of the ancient temples, are faults that are forgotten in the harmonious impression of the whole—a harmony which has caused many travellers and artists to prefer Sta Sophia at Constantinople to St. Peter's at Rome.

In the West, Byzantine art took root first in the possessions of the Greek emperors of Italy. The church of San Vitale, at Ravenna, was constructed in the sixth century, at the same time as Sta Sophia. This religious edifice is small and octagonal. Its cupola is supported on eight large pillars resting upon eight apses, and between the pillars and the apses runs an aisle, from which each apse is separated by three arcades. A gallery runs around the church, above which springs the cupola pierced by eight windows.

San Vitale is removed still further than Sta Sophia from the Classic architectural traditions, none of its ornaments having been borrowed from the ancient monuments. Certain capitals distinctly recall the Corinthian, but the volutes and the foliage are far from being pure. Most of them are square at the top and assume by insensible gradations the circular form. Sculptured trellis-work helps to redeem the poverty of the outline.

Like all Byzantine constructions, San Vitale has in spite of its limited dimensions an aspect of decided grandeur and character. Very beautiful mosaics and marbles formerly lent to it a splendour of which it is now deprived, the choir alone having preserved its primitive decorations.

The church which Charlemagne constructed at Aix-la-Chapelle, and which he considered superior to all the churches in the world, is but a barbarous copy of San Vitale. It is a curious specimen of the poor talent and the depraved taste of the western architects of that period. Astonishment need not be felt that Charlemagne, one of the most intelligent men of his time, knew much less about architecture than a modern schoolboy. At that time it was difficult to find a workman who could carve a capital or square even a monolith. Such was the poverty of skilled labour that the common expedient was to rob an old edifice in order to furnish material for a new one. Proceeding on this principle, Charlemagne caused certain columns to be transposed from Ravenna to Aix-la-Chapelle for the adornment of this church, which is interesting only for the memorials it contains, being a kind of historical sanctuary.

"St. Mark's at Venice," says Théophile Gautier, "is a Sta Sophia in miniature, a reduction on a scale of an inch to a foot of the immense structure of Justinian. Nor is this to be wondered at. Venice, which a narrow strip of sea only separates from Greece, was always in familiarity with the East, and its architects sought out and reproduced the type of church which was then considered the most beautiful and rich in the Christian world. St. Mark was commenced in 979 under the

* A paper by Cyrus K. Porter, published in *Stone*.

doge, Peter Orseolo. Its architects had the advantage of seeing Sta Sophia in all its integrity and splendour before it had been profaned by Mohammed II. in the year 1453."

Under the five small domes at the sides of the structure open up the seven porches of the façade, of which five lead into the central atrium and two into the exterior side of galleries. The depth of these portals is garnished with columns in cipolino and pentelic marbles, in jasper and in other precious materials. "The central door, whose outline cuts the balustrade of marble that runs above the other arcade is, as it should be, richer and more ornamental than the others. Besides the mass of columns in antique marble which support it and give it importance, three tiers of sculptured ornaments exquisitely carved bring out into bold relief its outline by their projection. Above this porch are placed the celebrated horses of Lysippus, which for a time ornamented the Arc du Carrousel in Paris. Mosaics upon a gold ground shine on all the porches in the midst of enamels and numberless figures of every kind."

The atrium, whose round vault presents in mosaics the history of the Old Testament, leads to the nave by three bronze gates ornamented with silver, which it is said belonged originally to Sta Sophia. "Let us enter," says an observer, "into the interior."

"Nothing can compare with St. Mark's, neither Cologne nor Strasburg nor Seville—nor even Cordova with its mosque. Its effect is surprising and even magical. The first impression conveyed is that of a cavern of gold encrusted with precious stones which are at once splendid and sombre, sparkling and mysterious. Cupolas, vaults, architraves and walls are carved with little cubes of gilt crystals of unique form, among which the rays of light sparkle like the scales of a fish. Where the gold ground terminates at the height of the columns commences a clothing of the most precious and varied marbles. From the vault descends a great lamp in the shape of a cross of four branches whose points are decorated with lilies and which hangs from a ball of gold filigree. The effect is marvellous when the lamp is illuminated. Six pillars of alabaster with capitals in bronze gilt of Corinthian pattern support elegant arcades, around which runs a gallery the whole length of the church."

"In the area is the choir with its altar upon a dais between four columns of Greek marble carved like a piece of Chinese ivory-work by the most patient industry. The altar-screen, which is called the *pala d'oro*, is quite a confusion of wonders. It blazes with enamels, cameos, pearls, sapphires, silver and gold, while pictures in precious stones represent scenes in the life of St. Mark. It was made in Constantinople in 976. Finally, in the circle behind the great altar is a colossal figure of the Redeemer."

St. Front of Périgueux is a reproduction of St. Mark's, as St. Mark's is of Sta Sophia. It is erected on the same plan minus the vestibule, and the dimensions of both are almost the same. But in this instance one looks in vain for the wealth and splendour of the model. St. Front is poor and naked. Under the sad stone colour of its walls there are no mosaics, and yet the edifice is grand in character, so much power is there in a simple arrangement conceived in a great spirit.

After the erection of St. Front cupola churches were multiplied throughout France, but their architects abandoned in their construction the arrangement and style of the Byzantine works. Even at this early period a new character began to be manifest in the architecture of the West. In St. Front itself we find that Byzantine traditions are departed from, and in its arches instead of the round circle of the East we begin to notice a tendency to point the arch. The pointed arch is the exclusive feature of the Gothic style, and from its introduction dates the art of French architecture.

French architects in modifying their works and adapting them to the colder climate of the West changed the plan, aspect and ornaments of their churches. Sculpture reassumed its place upon the capitals and the walls instead of the many-coloured image-work of the mosaicists. Churches, in short, became at the same time more severe and more ornate.

The cathedral of Angoulême (1017-1120) is one of the most celebrated types of this transition between the Eastern or Byzantine and Romanesque or Western style. To the former belong the three cupolas that cover the nave; to the latter the general form of the building—its Latin cross, its transepts and apses, its historic frieze, its crown of double arcades and its corbelled cornice. As in St. Front the arches that sustain the cupola are narrowed at the top. Moreover, there is no trace of the Byzantine school in the pillarettes flanked with columns, or in the carving of the capitals, which consists of leaves and grotesque figures of animals.

The cupola placed at the intersection of the nave and transept is the same in diameter as the cupolas of the other churches we have mentioned, but raised as it is on a drum which towers high above the roof it looks larger than it is in reality. It is pierced with rich arcades of double columns in four of which are openings for windows. The façade is a great square wall covered with basso-relievo, and divided horizontally by three

rows of false arcades. Although it is no more than 60 feet high its great proportions give it a majestic and powerful appearance. Of all the square towers which the traveller sees between Poitiers and Bordeaux this is one of the most beautiful and the best situated. From a distance it looks heavy, but this effect vanishes when close at hand.

In concluding this interesting subject it may only be necessary for me to add that the Byzantine style was a combination of Oriental and Occidental elements, which had been united on the shores of the Bosphorus. When once its chief characteristics had been determined it was transferred unchanged to the most remote provinces. Five hundred years after Roman culture had embraced the civilised globe, and affected even semi-barbarous tracts, the influence of Byzantium was extended over the greater part of the world then known, and to lands previously quite uncivilised. The centre of culture had been removed somewhat farther eastward, but the extent of its influence was scarcely diminished.

At the east, in distant Asia, the Sassanidæ borrowed more from Byzantine stock than they contributed to it. In the south-east newly arisen Mohammedan art received its first and most important impetus even more directly from the same source. The north-east of Europe and the Asiatic shores of the Pontus retained the Byzantine civilisation longer than did the capital itself. Indeed in these countries its traces are evident even to-day. In Italy such maritime emporiums as Ravenna and its successor, Venice, were chiefly Byzantine in character, while even in political respects certain towns of Magna Græcia and Sicily long continued in intimate connection with Constantinople. Even the Germanic provinces felt its influence in architecture at least through the mediation of Italy, and in painting, with its branches, mosaic-work and illumination, directly from the Bosphorus.

Because of its enormous extent and the peculiar and tenacious character of its artistic work, Russia is by far the most important of the countries influenced by Byzantine civilisation. In it alone Byzantine art has continued to be practised up to the present day. Unfortunately it came under its influence in an age when the style of the Eastern empire had declined into mechanical mannerism. Christianity with its higher civilisation was not generally introduced into the Muscovite empire before the end of the tenth century, until Vladimir the Great had been baptized at Kherson on the occasion of his marriage with the Byzantine Princess Anna in 988. It was therefore not strange that the Byzantine style when it first appeared on the steppes of the Don and the Dneiper was quite without connection with the Greek colonies on the northern shore of the Black Sea. Kiev, the Russian capital at that time, consisted entirely of wooden huts, and the 400 chapels which it was known to have contained shortly after the death of Vladimir can have been only small timber constructions. The more important ecclesiastical edifices of the country, often built by Greek architects, were at that time few in number. But the churches of Sta Sophia at Kiev, Novgorod and Tchernigof, which must have resembled the great Sta Sophia at Constantinople in general arrangement as well as in name, soon exercised a decisive influence upon the rude and untrained inhabitants of southern Russia.

TESSERÆ.

Unity and Variety.

THERE are those who maintain that the true, the good and the beautiful are not really reducible to simpler terms when they are considered in their most generalised form, though, of course, in their more particular determinations the elements can be analysed. At any rate, some form of the doctrine that the beautiful is based on the unity amid variety has found extensive acceptance, and a few samples of how authors work this theory will be instructive. On this point Barry says that the disputes about definition do not represent corresponding divergencies in the idea itself of the beautiful; and he allows the theory of unity in variety on condition that this combination be such as to show "fitness of conformity to the design of each species." Cousin, dispensing with this limitation, says:—"The most probable theory of the beautiful is still that which makes it consist of two elements mutually opposed and equally necessary—these are unity and variety. Take a beautiful flower: undoubtedly it has got unity, order, proportion, symmetry, for without these it would lack that intelligible significance which is so marvellously present in all things. But at the same time what diversity there is. What delicate shades in the colour, what richness in the smallest details. In mathematics themselves, what is beautiful is not the abstract principle, but the principle bearing with it all its long train of consequences. Unity and variety are the notions applicable to all orders of beauty." In support of Cousin stands his compatriot Lacordaire:—"Isolation is the denial of order, of harmony, of beauty, since

none of these things can be conceived without the double idea of plurality and unity. Plurality without unity is positive disorder, unity without plurality is negative disorder. In the former case the bond is wanting to the things; in the second case the things are wanting to the bond." Mr. Ruskin also says:—"Composition means literally and simply putting together several things so as to make one thing out of them, the nature and goodness of which they will all have a share in producing. Thus a musician composes an air by putting notes together in certain relations, and a painter a picture by putting forms and colours in pleasant order. In all these cases, observe an intended unity must be the result of the composition. Everything should have a determined place, perform an intended part, act in that part advantageously for everything that is connected with it." The practical lesson is that we should improve many of our unpleasing productions by more attention to the variety which saves from wearisome monotony and to unity, which saves from distraction and pointlessness, and these results are often desirable for higher ends than mere artistic effects.

The Inspired Workman.

We are apt to forget that in the great epochs of art in ancient Greece, when Phidias was decorating the pediment of the Parthenon in Italy in the sixteenth century, when Leonardo da Vinci, Michel Angelo and Raphael executed the great works which have been the admiration of the world, those were only the ultimate and highest outcome of a taste for art which permeated the community. Then the humblest workmen vied with each other, and every pot and pan, spoon and fork, were beautified by the most exquisite and refined taste. Many great artists began their career in a workshop like Francia, Ghirlandajo and Benvenuto Cellini, and rose step by step to become great painters and sculptors. It is idle to imitate one characteristic of an age and expect that it will bring all the rest with it; the age was all of a piece, and all the phenomena dovetailed into each other. It has been argued, apparently seriously, that because in the Middle Ages workmen were entrusted with the decoration of buildings, if we did the same we should have a great school of architecture. Nothing can be more futile; workmen being entrusted with decoration is a detail which has no importance or significance except in connection with others. It is related that when the cathedral of Orvieto was built in the thirteenth century, the citizens watched its progress with passionate interest. Such was the delight which they experienced at the sight of every embellishment added to their church and such the fervour of their sympathy, that they devoted their spare time to dragging the stones from the quarries, and brought food and drink for the workmen that nothing might be lost. The zeal for the beauty of the building animated the whole community, and was shared by the workmen who may have been entrusted with the decoration. How can we compare such times with our own? Where is the zeal which animates our communities? How can we entrust men with the decoration of a building who care only for Saturday's wages, for short hours, full pay and easy work? The idea is an anachronism. We must take our times as we find them, our institutions as they exist; we cannot change or revolutionise a state of things rooted in prevailing ideas and the habits of daily life; all we can do is to work in them and by means of them. We cannot expect to produce a great school of art upon a substratum of indifference; we must begin from the foundation and educate the masses upwards from the humblest forms of art rising gradually to the highest. When we have done that we may expect a display of great art, which shall not be a graft but a natural and spontaneous product of existing conditions, as great art always has been.

Idealism and Art.

Idealism in a picture is that part of it which distinguishes it from a photograph. It is what the artist brings to nature, the causes for which he uses nature, and that voice which he tries to make articulate by her help. It represents in a picture the creative power, the master passion, the individuality or *ego* of the painter, which must impress itself upon his transcript of nature, and is always striving to do so. If this individuality be strong, it will compel nature to obey it, and if it be weak it will itself be compelled to obey nature and follow whithersoever she leads; if this be the case to such an extent that the artist's work bears no impress of the individuality of the artist, it cannot properly be called a work of art. Now if this idealism can do so much towards holding the balance between the mere material part and the purely mental part of art, even in a purely scientific age, what must have been its power when the strongest force and master spirit of the time was fighting on its side? And this has been the case in the most splendid periods of art history. The idealistic side of art is strong indeed in an age when every object and aspect of nature is seen through the atmosphere of poetic imagination; when the heroic overlaps and hides the commonplace, and when every mountain, river, or stream is not a scientific fact, weighed and gauged by scientific observation, and subject to natural laws registered by

science, but the centre of some poetic legend with a beautiful anthropomorphic basis, and its laws the incidents of a dramatic poem. Under such an influence Greek art grew and flourished. Steeped in that rich mythology, the artistic spirit of the age could spontaneously throw itself in a beautiful concrete form. The heroic could be embodied in the Theseus, the divine in the Venus of Milo; visible embodiments of a powerful impulse, but an impulse favourable to and in accordance with the highest aims of imaginative art.

Ancient Ink.

The ink which the ancients generally used was composed of lamp-black mixed with gum, as we are informed by Dioscorides and others who give the recipe for making it. Ink of this kind may be called carbonic; it possesses the advantages of extreme blackness and great durability, the writing remaining fresh so long as the substance on which it is written exists, but as it does not sink into the paper, it is liable to the great inconvenience of being easily and entirely removed, for if a wet sponge be applied to it, the writing may be washed away and no traces whatever of the characters will remain. The facility with which documents might thus be obliterated gave occasion to fraud, as an artful forger was able to remove such portions of the original writing as he might desire to get rid of, and thus profit by the absence of material words, or insert in the blanks which he had made such interpolations as might serve his turn. Many common accidents, whereby books and writings were exposed to wet, or even to damp, were also fatal, or at least highly injurious, to compositions and muniments of great value. Various expedients were therefore attempted to remedy an imperfection from which many must have suffered severely. Pliny informs us that it was usual in his time to mix vinegar with the ink to make it strike into the paper or parchment, and that it in some degree answered the purpose. It should be seen that vitriolic ink was also adopted soon afterwards, which possesses in perfection the quality that was desired of sinking instantly into the paper, so as to make it far more difficult to discharge it without destroying the texture on which it is written and of being perfectly secure against water, by which Indian and other carbonic inks are so easily effaced. It is not, however, equally secure against the effects of time, for vitriolic ink gradually fades away, becomes paler by degrees, turns brown and yellow and is scarcely legible, and sometimes, as the parchment grows yellow and brown with age, disappears altogether. A compound kind of ink came next into use, which united the advantages and avoided the defects of the two simple sorts; such a mixed ink was generally used for several centuries, and with this the manuscripts that are now most fresh and legible appear to have been written.

Innate Ideas of Beauty in Building.

As men unacquainted with the theories of philosophers have been appealed to in support of the theory of association, let us take a person of that description to a proper point, within view of a building presenting all the elegance of Grecian architecture, but of the existence of which he had no previous knowledge, nor of the rules and proportion followed. Will this person admire the structure or will he not? Will he instantly feel an emotion, or will he take time before he utters a word, or allows himself to be moved, to find out for what purpose it was erected; and whether, according to his own ideas, it be adapted for that purpose? Does he suspend his feelings till he has examined the kind of stone and learned its qualities; till he has probed the thickness of the walls, and dug down to the foundation to ascertain whether it be rock or sand? Will he pause to consider whether much skill and much power were exerted in the erection? Will he hesitate till he calculates the expense? Will he approach the portal till he searches for the date? Will he sit down to meditate quietly on the greatness of Rome and of Greece? If he did all this no one would be astonished at his being called little better than insane. So far from such an operose process being consequent, we should find the effect instantaneous; and although it should be discovered after a painful search that, in its interior arrangement, this fine building was ill adapted to its purpose; that it was constructed of a stone far from durable and on an unstable foundation, that it cost but little money and was but a month old—the only feeling which such circumstances are likely to excite is regret that so imposing an exterior had not been formed of more durable materials, and that the accommodations were ill contrived; it would never be said that the elevation was ugly. To prove that association has little connection with the admiration which architecture excites—that there is something in our minds which directs us to prefer certain forms and certain proportions in one form relatively to another—we have only to go back to the individual who invented any of the orders, belonging to Greece, or to him who invented the Gothic style, or to any one who has improved on the first idea of them, and to ask what could have led an individual to construct what he had never seen or heard of? What could have induced him to fix

on certain proportions for one part of a building to bear to another? Nothing, surely, but his own innate power. He must have felt certain forms to be more pleasing than others; certain arrangements to these forms to be more satisfactory than others. To him certain proportions in columns were irresistible, and he reduced them to practice. Subsequent ages have felt that they cannot be altered without giving offence.

The Walls of Babylon.

In his description of Babylon Herodotus says:—"A deep and wide trench full of water encircles it, next to which is a wall 50 royal cubits in breadth and 200 cubits in height (the royal cubit exceeds the ordinary cubit by three fingers). It must be observed that the earth out of the trench was employed for this purpose, and the wall was constructed in this manner. When they dug the ditch, they removed the earth and made it into bricks, and having made a sufficient number of them, they baked them in furnaces; then making use of heated bitumen by way of mortar, and interposing layers of reeds throughout thirty courses of bricks, they first built the side of the ditch and then the wall itself in the same manner." Some commentators instead "throughout thirty courses" read in "every thirtieth row." Now, it is certain that the interposition of reeds with bitumen was intended not only to strengthen the building, and therefore most naturally used nearest the foundation, but more particularly to protect the lower part of the wall which lined the ditch from the action of the water, and also the lower part of the city wall, or any other of the buildings, from the damp of the ground. This was the chief use of the bitumen, which was inferior as a cement to the fine lime mortar which was employed in the higher parts of the buildings. Hence it is difficult to see why the obvious translation is to be departed from, and this passage rendered by "every thirtieth row." Accordingly, Wesseling, in his commentary, says the thirty lowest courses. In which also Schweighauser agrees, on the ground that in this way the superstructure would be better supported. There is, indeed, no warrant for introducing the word "imis" into a literal translation; but there can be no doubt Herodotus means the thirty lowest courses, if he means the thirty courses to be consecutive, and it appears reasonable that the passage should bear this interpretation.

Wenceslaus Hollar.

The English school of engraving is indebted to foreigners for the early foundation of the bright and lasting fame which it possesses. The efforts of the Early English masters, who solely employed the burin, were inferior, although Evelyn, in his "Sculptura," contends that William Lightfoot, who was employed as an architect in the building of the Royal Exchange, but whose name as an engraver is not recognised, was nearly equal to Wierinx. The earliest artist that claims attention is Wenceslaus Hollar, born at Prague in 1607. He was originally brought up for the profession of the law. Disturbances in his own country compelled him to take refuge in Frankfurt. The Earl of Arundel, during an embassy to Ferdinand II., happened to meet Hollar at Cologne, and became his patron, and on his return to England introduced him to Charles I. He had a great attachment for his royal master, and interested himself so much in his cause that he was taken prisoner at Basing House, in Hampshire. On his release he took up his residence at Antwerp, where he employed his time in engraving chiefly from the collection of his former patron, the Earl of Arundel, who had also removed to that city. In 1652 he returned to London, and met with greater encouragement, but the plague and the great fire of London again threw him back, and caused still further disappointments. He was employed by Government in 1658 to make some drawings of the town of Tangiers, together with the forts, which he afterwards engraved. During his voyage to England the vessel was engaged by seven Algerine corsairs off Cadiz, and after a gallant struggle, in which the pirates were beaten off, she continued her voyage. Hollar escaped unwounded, and on his return commemorated the action by a very clever engraving. For his labour of two years he received only a hundred pounds, and that with much delay and after many humble petitions from the poor engraver. The life of this industrious man ended in penury, and on his death-bed the bailiffs who came to seize upon the little remnant of furniture he possessed were requested by him to leave his bed an hour or two longer, "and then to remove him to the prison of the grave." He executed about 2,400 prints with boldness and freedom, embracing every department of the art.

Gothic Cathedrals and Subsidiary Buildings.

It is a great mistake to think, as has too often been maintained, that Gothic cathedrals need to be completely isolated to produce all the effect which their architecture is capable of; the constructors of those cathedrals did not share in that notion, and nowhere have they been seen to put it in practice. There does not exist in Europe a cathedral which has not been

originally flanked at the north or at the south, not only by its sacristies, but also by the palace of the Bishop, the cloister of the canons, their chapter-house and the vast buildings which were necessary to lodge the chapters, almost always very numerous and very rich. In England many of the cathedrals have preserved these dependencies built in the same style as the body of the church, and they often strike more at first sight precisely owing to this encircling, whose inferior proportions make those of the central monument tell more. As a general rule, the grandeur of the admirable edifices of the Middle Ages, like all terrene grandeur, has need of points of comparison which make them to be appreciated and stand out. Absolute isolation is fatal to them. It is certainly not right to heap up neighbouring edifices so as to hide notable portions of the whole from the eye which contemplates them; it is not right to permit that houses should stick like a crust between the buttresses. But neither is it right to make a void around cathedrals so as to drown in that void the magnificent dimensions which they have received from their authors. They were not at all made for the desert like the Pyramids of Egypt, but otherwise to soar above the crowded dwellings and the narrow streets of ancient cities, to domineer and raise our imaginations by their vast extent and their immense height, immovable but changeless symbols of the truth and of the authority of that Church of which each cathedral was the image in stone.

GENERAL.

The Competition for the municipal buildings and law courts, to be erected in Cardiff at the cost of 200,000*l.*, has been decided. Acting on the advice of Mr. A. Waterhouse, R.A., the committee awarded the first prize of 500*l.* to the plans sent by H. V. Lanchester, J. S. Stuart and E. A. Richards, Bedford Row, London; the second prize of 300*l.* to J. S. Gibson and S. B. Russell, Gray's Inn Road; and the third prize of 200*l.* to Alfred Cox and A. H. Cooksley, Adam Street, Adelphi. Fifty-six sets were submitted. The site will cost 160,000*l.*

Gainsborough's Portrait of General Honywood, which was among the works of art in Marks Hall, has been sold for 4,000 guineas.

Mr. J. J. Shannon, A.R.A., has obtained the first prize of the International Exhibition of Painting now open at Pittsburg, U.S.A. This prize consists of a gold medal with a purse of 1,500 dols. added thereto. The picture which obtained this honour is a portrait of the artist's daughter "Kitty" in her riding habit.

Mr. M. B. Teulon, of the firm of Messrs. Teulon & Wood, architects, Crowborough, died at Worthing on the 8th inst. For many years he was the only architect at Crowborough and was connected with the building of most of the houses that have been erected in the place during the last seventeen years.

Mr. A. Macalister, an architect who practised for over half a century in Belfast, died on the 7th inst. in his seventy-sixth year.

Mr. Thomas Bush Hardy, the painter, died on Sunday last. The work on which he was last engaged was a large panel representing the Destruction of the Armada for the Army and Navy Club.

The Fire which broke out at Dover Castle on Tuesday was fortunately confined to the officers' quarters, a range of buildings erected in 1858.

Mr. Leslie Ower, president of the Dundee Institute of Architecture, read a paper on "The Evolution of Style in Architecture" before the Edinburgh Architectural Association on Wednesday last.

Mr. G. Herbert Bayley, A.M.Inst.C.E., civil engineer, architect and surveyor, of Manchester and Lymm, Cheshire, has been elected a member of the Sanitary Institute.

The Dean and Chapter of Canterbury have approved the revised design prepared by Mr. Jackson, R.A., for the tomb of the late Archbishop Benson. It will be Early English in character, and has a general resemblance to the tomb of Archbishop Peckham in the Martyrs' Chapel. The construction of the memorial will be at once proceeded with, and when completed it will be erected over the resting-place of the late Primate in the north-west angle of the cathedral nave.

An Ancient Portrait of King Henry VI., the founder of Eton College, has been hung upon the panelled wainscot on the north side of the hall a short distance from the west end of the building. The picture represents the monarch attired in regal robes with scarlet ermine-trimmed cloak. A velvet cap covers the head, and around the shoulders is a richly-jewelled "S.S." chain with pendant cross. There are several rings upon the fingers of the clasped hands, and the waist is encircled by a gold tasselled girdle.

The Architect.

THE WEEK.

THERE is not much chance of Irish architects gaining wealth if they devote their time to public commissions. In the last report of the Council of the Irish Institute some cases are brought forward which suggest that authorities believe in the squeezability of architects. One relates to the schedule of fees adopted by the Board of Control for architects engaged on lunatic asylums, which is much below the usual scale. On the remonstrance of the Irish Institute, the Board decided to adopt the schedule formerly in use. The Board of Control have also proposed to withdraw specialist's work from the architect's control. The Council of the Institute is of opinion that, in order to carry a building to a successful conclusion, it is absolutely necessary that at all stages of the work, from its original inception to its completion, the architect should exercise a general control over all the various contractors employed, and that he should be held responsible for bringing the entire undertaking to a successful issue. If the specialist's works were withdrawn from his control, divided responsibility would result, and in many cases dissatisfaction and possibly litigation would ensue. In connection with the employment by the Board of Control of architects for lunatic asylums, the Council also desires to place on record its emphatic condemnation of the practice of appointing as a nominal architect any person with whom it is proved necessary to associate a qualified architect in order to insure the preparation of proper plans and the necessary skilled supervision of the work, as when such appointments are made professional fees are paid to persons by whom no equivalent service is rendered to the public. It is also mentioned in the report that the Black-rock Commissioners have passed a resolution stipulating that the architect to be employed for an extension of the town hall should pay the clerk of works out of his commission. The Council consider it is of the greatest importance that the public and the members of the various boards should be made to understand that no member of the Institute should accept less remuneration for his services than that which is provided by these rules.

THE competition for the lunatic asylum in Londonderry was remarkable in other ways besides the proposed reduction of fees and the withdrawal of specialists' works. Eight architects were invited to take part, and a professional assessor was brought over from London. A plan by Mr. CHARLES OWEN was awarded the first place, and one by Mr. W. H. BYRNE the second. The suggestion was made by the governors that Mr. BYRNE should be afforded an opportunity of amending his plans, in order that the question should be reopened as to who should be entrusted with the work. Mr. BYRNE refused to amend his plan and declined to take part in any proceeding which would upset the award of the assessor. His conduct was so much approved, the following resolution was passed unanimously at the annual meeting of the Institute:—"We, the members of the Royal Institute of the Architects of Ireland, desire to convey to Mr. W. H. BYRNE our appreciation of his honourable and disinterested action in the matter of the Londonderry lunatic asylum competition. We welcome this additional evidence of the willingness of architects taking part in competitions to abide loyally by the award of a qualified professional assessor, and we deprecate any attempt to set aside or interfere with such an award." The report, in referring to the subject, says:—"The Council has had before it a report of proceedings at a conference of the Board of Governors with the officials of the Board of Control at Londonderry in November last. The Council notices with regret, from observations appearing in such report, that there appeared to be amongst those present at the meeting a very imperfect appreciation of the fair play to which architects invited to submit designs for a public building in limited competition, under an assessor, are entitled. The result of this competition must be to greatly discourage well qualified architects in the future from accepting invitations to take part in such competitions, as it would appear from the report that the selection of the best plan by the professional

assessor affords no security that the architect whose plans are placed first shall hold the position he has justly won. It is the unanimous opinion of the profession that when the design of an invited competitor is placed first by the assessor, the author should be rewarded by being entrusted with the whole of the work for which he was invited to compete and all emoluments attaching to it. The following members of Council were elected:—Messrs. W. M. MITCHELL, C. J. MC CARTHY, J. C. ASHLIN, J. R. CARROLL, CHAS. GEOGHEGAN, J. J. O'CALLAGHAN, J. H. PENTLAND, R. C. MILLER, W. K. PARRY and BYRNE; auditors, FRED. BACHELOR and C. H. ASHWORTH; Mr. T. DREW, R.H.A., president, and Mr. A. E. MURRAY, secretary.

THE late J. H. PULLAN, brother-in law of WILLIAM BURGESS, gained much reputation by his discoveries at the Temple of Minerva Polias, at Priene. But he was not permitted to follow out his excavations. According to Professor WHEELER, the American archæologist, the local lime-burners and masons have, since the English expedition, made away with what was left of the temple, and nothing now marks its site but a heap of stones. Two years ago the German archæologists resolved to begin new investigations, and the excavations so far made have been surprisingly fruitful. Although Priene did not reach the height of its prosperity until the time of ALEXANDER, it seems to have possessed a certain superiority of artistic cultivation, possibly in consequence of the relations which it maintained with Athens, of which it is said to have been a colony. It is most fortunate, therefore, that the sub-structure of the ancient city has been found in a remarkably perfect state of preservation, so that the streets, with the various buildings in them, the agora with its porticoes, the council-house, the seats in which are still in place, and a small theatre, are plainly to be distinguished. In the private houses, not only is the style and general distribution quite distinguishable, but the remains of the decoration are still visible. Professor WHEELER likens the ruins to those of Pompeii, and the study of them, in comparison with those of the Græco-Roman town of nearly five hundred years later date, will be most instructive.

A FEW glimpses of AUGUSTUS WELBY PUGIN are to be obtained with the aid of Mr. WARD's "Life and Times of Cardinal WISEMAN." The architect was rather nervous about the influence of a divine who was familiar with pagan basilicas, and was not prepared "to go to the death," like MONKEBARNES, to uphold the superiority of the pointed over the round arch. He cried when he saw the bishop go beyond the rood-screen with a couple of ladies. PUGIN was also an amateur theologian, and as such was of importance among the English Catholics who were compelled to seek advice from Maynooth professors when they were in doubt. PUGIN used to talk five or six hours on a stretch about church ceremonies, liturgies and antiquities of all kinds. He was, as J. B. MOZLEY wrote, "infinitely amusing." It was easy for a rival architect to move his wrath. One of them "ought to be hanged," he said, for building an obnoxious steeple. When told that the Dean of YORK deserved to be suspended, PUGIN asked, "In what way, sir?" He saw a fiddler ascending the organ-loft of one of his churches, and could hardly forbear knocking the man down with the fiddle, and he would not attend the opening ceremony. When PUGIN heard a Jew was converted by praying in one of the Roman churches, he replied it was demonstrably false, for a man could not pray in so hideous a church. But when it was said the convert was thinking of the uncouthness of the building, then PUGIN said, "I honour him; the story is demonstrably true." He saw a man fishing, and he remarked, "Life is not meant for that sort of thing. At six o'clock this morning I was at the top of St. Chad's steeple." According to Mr. WARD, the effects of PUGIN's influence are still visible, for "in many of the theological seminaries there is a special chair of architecture and art." It would be interesting to discover a few cases where the lessons from the chairs have enabled the clergy to discriminate between works of art which continue the traditions of their church and those which are opposed to them. PUGIN would now be more grieved on entering a church than he used to be half a century ago.

DICKENS AND BUILDING.

THERE was a time when Christmas and DICKENS appeared to be for ever united, and to think of one was to recall the other. It is now, however, assumed there was never any true relation between them, for the novelist's Christmas was, it is said, a fictitious season devised for his own advantage by a man who was without any respect for realism. Whatever truth may be in such criticism, it would be a gain to most of us if we could look at the world around us in the winter season with the imagination and kindness with which CHARLES DICKENS temporarily endowed his readers. He did not believe that Fancy was so great an evil as it was represented to be by pseudo-scientists like Mr. McCHOAKUMCHILD, H.M. Inspector of Schools, who, under the inspiration of the Department of Art, told the classes, "You must discard the word Fancy altogether. You have nothing to do with it. You are not to have, in any object of use or ornament, what would be a contradiction in fact. You don't walk upon flowers in fact; you cannot be allowed to walk upon flowers in carpets. You don't find that foreign birds and butterflies come and perch upon your crockery; you cannot be permitted to paint foreign birds and butterflies upon your crockery. You never meet with quadrupeds going up and down walls; you must not have quadrupeds represented upon walls. You must use for all these purposes combinations and modifications (in primary colours) of mathematical figures which are susceptible of proof and demonstration. This is the new discovery. This is fact. This is taste." The advice is a compendium of the doctrine of decoration which once emanated from South Kensington, and which was for a time accepted as infallible.

DICKENS could not approve of restrictions of the kind, for they would be as fatal to his own art as to the ornamentist's. His writings, and especially the parts which are most delightful, are not susceptible of proof and demonstration which would satisfy a mathematician or a lawyer. Every one who is familiar with his books must be aware of the fact, and this is not the place to discuss the subject at any length. But fancy never exercised stronger power over him than when he was describing buildings, and his Christmas stories would afford evidence enough of his peculiarity without referring to his longer novels.

DICKENS not only observed, but created. Whenever he liked, inanimate matter could appear to him as having many of the properties of living, organic beings. There was not even a necessity for him to see a thing; the wind is as invisible as it is impalpable, and yet in "The Chimes," without the least exaggeration, it is depicted as if it were some perturbed spirit which could not find repose within the walls of a church. Familiar as the passage must be to our readers it will bear repetition:—

The night wind has a dismal trick of wandering round and round a building of that sort, and moaning as it goes; and of trying, with its unseen hand, the windows and the doors, and seeking out some crevices by which to enter. And when it has got in, as one not finding what it seeks, whatever that may be, it wails and howls to issue forth again; and not content with stalking through the aisles and gliding round and round the pillars, and tempting the deep organ, soars up to the roof and strives to rend the rafters; then flings itself despairingly upon the stones below, and passes, muttering, into the vaults. anon, it comes up stealthily and creeps along the walls, seeming to read in whispers the Inscriptions sacred to the Dead. At some of these it breaks out shrilly, as with laughter; and at others, moans and cries as if it were lamenting. It has a ghostly sound, too, lingering within the altar; where it seems to chaunt, in its wild way, of Wrong and Murder done, and false gods worshipped in defiance of the Tables of the Law, which look so fair and smooth, but are so flawed and broken. Ugh! Heaven preserve us, sitting snugly round the fire! It has an awful voice, that wind at midnight, singing in a church!

M. TAINE interprets passages like the foregoing as proving that DICKENS was a poet, a man of northern race and a passionate Protestant. But French taste could not approve of a mode of treatment which was so *bizarre*, and M. TAINE compared the imagination of DICKENS to a string which was too tightly strained and which on the least disturbance produced sounds that were not to be heard elsewhere. It resembled a sort of monomania, and its effect on the reader was like grotesque dreams. If M. TAINE were an architect instead of a professor of æsthetics he would

condone many of DICKENS's apparent exaggerations. It is only in his novels we have descriptions of buildings which are not easily skipped by the reader." M. TAINE and all who derive their canons of taste from French sources must believe with BOILEAU that, although there is no serpent or odious monster which cannot by a delicate pen or pencil be made "an objet aimable," yet when a building is to be presented there cannot be too few details. A writer without taste—

*S'il rencontre un palais, il m'en dépeint la face,
Il me promène après de terrasse en terrasse;
Ici s'offre un perron; là règne un corridor;
Là ce balcon s'enferme en un balustre d'or,
Il compte des plafonds les rondes et les ovales;
"Ce ne sont que festons, ce ne sont qu'astragales."*

HOMER himself would not be found to comply with BOILEAU's rules, and it is common sense that if a building or part of one can serve any purpose in a description, the reader should not be expected to go through an effort in order to supplement the writer's words. In the description of the old institution where REDLAW, "The Haunted Man," teaches, there is nothing that can be called technical, and yet enough is said to give an impression of what the buildings were like, and the effect they were likely to produce on a nervous scholar:—

His dwelling was so solitary and vaultlike—an old, retired part of an ancient endowment for students, once a brave edifice planted in an open place, but now the obsolete whim of forgotten architects—smoke-age-and-weather darkened, squeezed on every side by the overgrowing of the great city and choked like an old well with stones and bricks; its small quadrangles, lying down in very pits formed by the streets and buildings, which, in course of time, had been constructed above its heavy chimney-stacks; its old trees, insulted by the neighbouring smoke, which deigned to droop so low when it was very feeble and the weather very moody; its grass plots struggling with the mildewed earth to be grass, or to win any show of compromise; its silent pavements, unaccustomed to the tread of feet and even to the observation of eyes, except when a stray face looked down from the upper world, wondering what nook it was; its sundial in a little bricked-up corner, where no sun had straggled for a hundred years, but where, in compensation for the sun's neglect, the snow would lie for weeks when it lay nowhere else, and the bleak east wind would spin like a huge humming-top when in all other places it was silent and still.

His dwelling, at its heart and core—within doors, at his fireside—was so lowering and old, so crazy, yet so strong, with its worm-eaten beams of wood in the ceiling, and its sturdy floor shelving downward to the great oak chimney-piece; so environed and hemmed in by the pressure of the town, yet so remote in fashion, age and custom; so quiet, yet so thundering with echoes when a distant voice was raised or a door was shut—echoes not confined to the many low passages and empty rooms, but rumbling and grumbling till they were stifled in the heavy air of the forgotten crypt where the Norman arches were half buried in the earth.

It will be observed how much of the effect depends on making lifeless things become sentient, and if a few more matter-of-fact terms were introduced the vigour of the description would vanish. DICKENS's peculiar genius is no less manifest when he has to describe individual objects of no great size instead of a group of buildings. In "A Christmas Carol" he undertook the very difficult task of convincing a reader that it was possible for one of the hardest of men and the most unimaginative to see a ghost. With that object it was necessary to suggest that the miser SCROOGE was in a peculiar psychological condition or state of disease. Accordingly, DICKENS begins by describing how he took a door-knocker for a portrait, or rather the face of his deceased partner MARLEY, who was a man like himself.

He (Scrooge) lived in chambers which had once belonged to his deceased partner. They were a gloomy suite of rooms, in a lowering pile of building up a yard, where it had so little business to be that one could scarcely help fancying it must have run there when it was a young house, playing at hide-and-seek with other houses and forgotten the way out again. It was old enough now and dreary enough, for nobody lived in it but Scrooge, the other rooms being all let out as offices. The yard was so dark that even Scrooge, who knew its every stone, was fain to grope with his hands. The fog and mist so hung about the black old gateway that it seemed as if the Genius of the Weather sat in mournful meditation on the threshold.

Now, it is a fact that there was nothing at all particular about the knocker on the door, except that it was very large. It is also a fact that Scrooge had seen it, night and morning, during his whole residence in that place; also that Scrooge had as little of what is called fancy about him as any man in the City of London, even including—which is a bold word—the Corporation, aldermen and livery. Let it also be borne in mind that Scrooge had not bestowed one thought on Marley since his last mention of his seven-years' dead partner that afternoon; and then let any man explain to me, if he can, how it happened that Scrooge, having his key in the lock of the door, saw, on the knocker, without its undergoing any intermediate process of change—not a knocker, but Marley's face.

Marley's face. It was not an impenetrable shadow, as the other objects in the yard were, but had a dismal light about it, like a bad lobster in a dark cellar. It was not angry or ferocious, but looked at Scrooge as Marley used to look: with ghostly spectacles turned up on its ghostly forehead. The hair was curiously stirred, as if by breath or hot air, and though the eyes were wide open, they were perfectly motionless. That and its livid colour made it horrible, but its horror seemed to be in spite of the face and beyond its control, rather than a part of its own expression. As Scrooge looked fixedly at this phenomenon it was a knocker again.

A man who can be deceived by a knocker on a foggy night would not be proof against visions of spirits. SCROOGE was not altogether a trustworthy witness about spiritual manifestations, but as he was converted and became a friend of BOB CRATCHIT and his family, besides discovering how Christmas should be kept, we can afford to overcome his optical and mental delusions.

All that we claim for DICKENS is the skill to impart interest to buildings, but it would be unjustifiable to suppose he was competent to produce accurate descriptions of them. He rendered his own impressions, but nothing more. It is also remarkable that he is far more successful with imaginary than with real buildings. DICKENS repeatedly acknowledged that he did not possess the knowledge which would enable him to notice pictures and statues as they deserved; and he was, like the majority of his countrymen, still less competent to treat of buildings. What he says of High Street, Rochester, reveals his strength and weakness. He was familiar with the place from his childhood, but all he could say of it was the following:—

The silent High Street of Rochester is full of gables, with old beams and timbers carved into strange faces. It is oddly garnished with a queer old clock that projects over the pavement out of a red brick building, as if Time carried on business there, and hung out his sign. Sooth to say he did an active stroke of work in Rochester, in the old days of the Romans and the Saxons and the Normans; and down to the times of King John, when the rugged castle—I will not undertake to say how many hundreds of years old then—was abandoned to the centuries of weather which have so defaced the dark apertures in its walls that the ruin looks as if the rooks and daws had pecked its eyes out.

The extract suggests his method, viz. a few words about the character of the buildings as they appear, and then imagination is drawn on to enhance their interest. For that reason his references to buildings in his "Pictures from Italy" are insufficient to enable us to form a notion of the interiors or exteriors. But his words often help us to obtain a vision of some scene in a building. Thus in speaking of the Coliseum he says:—"In passing in, they who will may have the whole great pile before them as it used to be, with thousands of eager faces staring down into the arena, and such a whirl of strife and blood and dust going on there as no language can describe." It is not every visitor who is competent to create such a vision, but those who can are not likely to forget the building which was the scene of so much excitement and which is now a desert. The man who could say of the ruin, "Its solitude, its awful beauty and its utter desolation strike upon the stranger like a softened sorrow, and never in his life perhaps will he be so moved and overcome by any sight not immediately connected with his own affections and afflictions," must have been a genuine admirer of architecture, although he could not understand the elements of its greatness.

Mr. Charles Herbert Shoppee, F.R.I.B.A., F.S.I., has been elected architect and surveyor to the Auction Mart Company, Limited, in succession to his late father, Mr. Charles John Shoppee.

THE FIRE RISK OF ELECTRICAL-POWER INSTALLATIONS.

THE prevention of fire is at the present time attracting the attention of many, due to the recent conflagration in the City and the one in Paris, and numerous papers and contributions have appeared on the subject from various points of view.

Mr. LESTER TAYLOR's paper before the Manchester Insurance Institute from the point of view of electrical-power installations will no doubt serve a useful purpose.

Numerous rules have been issued by insurance offices, and we not long since commented on the new rules of the Institution of Electrical Engineers, but all these are chiefly concerned with electric lighting, as it is comparatively recently that the adoption of electric power has made any strides—that is, self-contained power plants in factories and the like, although, of course, small motors connected to public electric-supply mains have been numerous. As Mr. TAYLOR mentions, electric lighting and electric-power installations have some points in common, so really the only extra risk is the motor and its accessories. Now, is there a risk with a motor properly fitted and attended to? In an ordinary factory we should say No; but of course in positions where they are sometimes placed, and no doubt will continue to be unless strict rules are adopted, there is no doubt a risk. A motor, for instance, placed out of the way in some corner where dust and combustible particles can accumulate, and rarely receiving attention, may become a source of danger owing to the brushes becoming ragged and the commutator worn, excessive sparking being the result; or the resistance may become red-hot. Now, if the motor is always under notice there is little chance of these occurring, or, if they do occur, little chance of fire. There is a certain amount of danger due to switching on too suddenly, thus causing a rush of current; but if the proper apparatus is used to prevent this it is avoided. If a properly constructed and proportioned starting resistance is used the starting current will be very little in excess of the normal working current.

Mr. TAYLOR refers to the risk of the motors themselves taking fire, and also to the scattering of molten copper globules over considerable distances. We think this risk is very slight, except under very adverse conditions. We must, however, bear in mind that the development of electric power is without doubt destined to take an important part in our manufacturing industries, owing to the flexibility of a system of transmitting power by cables instead of cumbersome shafting, and the capability of attachment of the motor directly to the machine.

We see that these motors are scattered about the factory in various positions. Now if these positions are damp or dusty, some precautions should be adopted to prevent injury to the motor and danger of fire. There are several ways of protecting a motor. One is to enclose an open type motor in a case of iron or wood. The use of wood is not desirable, but it is surprising to see the great number of cases in which this is done, oily waste even being stored in the boxes sometimes, as stated by Mr. TAYLOR.

In other examples the case is part of the field magnets, and encloses all but the commutator and pulley. This type of motor, often called the ventilated enclosed type, is greatly used, and we think it fulfils all reasonable requirements. There is another type which is completely enclosed, including the brushes, and, in fact, everything except the pulley. These air-tight motors are heavy and expensive, owing to the want of ventilation, and are rarely used except in cases where the air is charged with explosive gases or other matter likely to cause explosion. These motors are chiefly used in mines. In this connection it may be mentioned that alternating-current motors are very suitable for dangerous situations, as there are no commutators and no possibility of sparks.

We have now concluded with the motor itself, and have agreed that there is, perhaps, a slightly greater risk with it than with shafting and belts, although there is a possibility of there being danger from fire even with these, owing to bearings firing. We now turn to switches, fuses and regulating resistances. There are many points in common between the switches and fuses for use with motors and lighting. In the former case there is a necessity for having the fuses protected rather better, and it is advisable to use

an iron box under lock and key for fuses, and an open box of the same material for switches. This precaution will remove all danger from damp, and in the case of fuses, of fire due to molten fuses falling on to wood or other inflammable material.

There are several precautions which should be, but very rarely are, taken with resistance boxes. These should be entirely ironclad, the case being perforated to allow ventilation. It is necessary that the resistance wires should be amply large for the work, otherwise severe overheating will occur and the resistance coils will get out of shape and fall. A very good precaution to take is to wind the wires on a rod of insulating fireproof material such as slate or asbestos. This will prevent distortion of the coils, however hot they may become.

It may be of interest here to give some extracts from the Phoenix rules, although we should hardly recommend these now that the Institution of Electrical Engineers' new rules are issued, but they will serve to indicate the view that insurance inspectors take of the matter.

"No dynamo, motor, transformer, battery . . . to be placed in any working room of any cotton, woollen, flax, jute, corn, saw-mill, &c. . . or where hazardous processes are carried on, or in which any hazardous goods are stored; they must never be hidden away in cupboards, lofts or roofs, &c.

"Electrical motors, when in rooms such as above described, should be placed in an approved fireproof compartment, so that if the motor was on fire, the fire could not spread, and provision should be made that fine dust or 'fly,' &c., could not get to the motor. The resistances should be inside the above compartment.

"An electrical-power installation requires the same safeguards that apply to an electric-light installation in which the conditions of supply and the electromotive force of the current are similar."

When we come to consider the dynamo or generator, we can hardly see that the risk is increased, as this is, or should be, always placed in a separate part, as, in the case of mechanical power, in the engine-room.

There are special precautions which should be taken in certain factories with reference to both the wiring and motors. In breweries, distilleries and paper-mills the dangers are from damp, and also in the last from chlorine and other bleaching agents; and for these reasons all motors should be self-enclosed and air-tight, or they will be damaged. In saw-mills fine dust is the objectionable matter, and this should be kept from the motors, switches, fuses and resistances. When naphtha and other chemicals which are solvents of rubber are used, the cables should be lead covered. In sugar-mills the high temperature is harmful to rubber, and in this case lead-covered paper or jute insulated cables must be used. Ironclad motors are also very advisable in these cases.

Mr. TAYLOR mentions that it is the practice in America to take power from the tramway overhead conductor. It does not seem to us to be a very hazardous thing to do if the negative terminal is connected mechanically and electrically to a rail bond in the road, and precautions are taken with regard to shock.

INDIAN ART SOCIETY.

THE annual meeting of the Society for the Encouragement and Preservation of Indian Art was held at the Imperial Institute. The president of the Society, Sir M. E. Grant Duff, was in the chair. The report which was submitted stated that since the incorporation of the Society under the license of the Board of Trade it had devoted itself to the same objects which it was originally established to promote. The Society had contributed to an exhibition held at the Crystal Palace and brought over native silk weavers to work at their trade, and also promoted sales of native work which had resulted in considerable sums being sent to the sufferers in the famine-stricken districts at Sholapur, Delhi and elsewhere. The working of the Society, it was further stated, was extending in India, branches having been established at Lucknow and Sholapur. In moving the adoption of the report, the chairman expressed his cordial interest in the operations of the Society, which was contributing in a quiet way to make the products of Indian art better known in this country, and doing some good to the better class of Indian artisans. Mr. T. H. Thornton seconded the motion,

and insisted on the importance of the Society taking care that none but good specimens of Indian art should be introduced to the British public, and that at a moderate price. The Society must differentiate their exhibitions from those of certain shopkeepers in London, and while he noted a marked improvement in this respect in the latest exhibition, he suggested that a display of palmistry was a little derogatory to the aims and objects of the Society. The report was adopted. Mr. Goldstein moved, and Sir Raymond West seconded, a vote of thanks to the office-bearers, and selected for special mention, as did indeed nearly all the speakers, the energetic efforts of Mrs. David Carmichael and Mrs. Pheroze Thomas, the secretaries. This was agreed to, and the retiring members of the council were re-elected. A vote of thanks was also accorded to the chairman on the motion of Sir Owen Tudor Burne, who appealed to lovers of art in England and India to assist the Society by becoming members or patrons. Sir M. M. Bhownaggee, M.P., took occasion to make a few remarks at the close, in which he dwelt upon the moral aspects of the work of the Society in relation to our fellow subjects in India. The efforts of English men and women who had passed more or less of active life in that country, and who now devoted themselves to promoting the interests of the poorer classes of natives in a philanthropic and practical manner, could not but constitute a bond of sympathy between the two countries.

THE BOGEY OF THE STUDIO.

AN address was given at Corbin Hall, Crouch End, by Sir Wyke Bayliss, president of the Royal Society of British Artists, to the students of the Hornsey School of Art. He said that the "bogy of the studio" appeared in three different shapes, and in each of them he must be peremptorily banished. His first shape was in the idea that art, after all, was nowadays a common thing, that there were thousands of people all trying to earn a living by art, and that what one could do hundreds of others could do equally. In ignorant minds that which was common was indistinguishable from the commonplace. But nature was full of common things; our daily lives were made up of them, and we should no more wish to be without them than we should wish the hedgerows to be without the wild rose. The commonness of beauty was the very crown and glory of nature. Art in reproducing nature began with paint but ended with passion, which was a term common to both; and when art had reached that term it had fulfilled its mission. It might be imperfect, but it could not then be commonplace. The second appearance of the bogy was in the suggestion that art was merely a commercial affair, because the artist painted for a living. He had seen people so frightened by the word "pot-boiler" that they had changed the whole purpose of their lives; and timid purchasers had been deterred by the sinister use of that little word from acquiring pictures which they wished to have and knew to be good. What was a pot-boiler? It was a picture painted by an artist, not in an idle moment, or for an experiment, but in the ordinary course of business for money. The finest art work which the world had ever seen had been done under those conditions. The friezes sculptured by Phidias on the Parthenon were pot-boilers, and no doubt "Mrs. Phidias and the kids" had their share of the payment made for them. The great painters of the Renaissance worked for money. Rubens did not paint his acres of canvas gratuitously. The finest portraits of Reynolds were painted not from the faces he chose, but from those chosen by country gentlemen who had the purses to pay for the portraits. Morland painted to get out of the sponging-house or to settle his score for beer. The most precious of Turner's works were painted for publishers, and the masterpieces of David Cox were done as copies for the young ladies whom he instructed in the art of painting in water-colours. Let the artist never be ashamed of working for a reward, if only his work were sincere. Let him do his duty by those dependent on him, and not only boil the pot, but see that there was something in it. Sincerity was the only weapon by which the bogy in this shape could be slain. As for the commercial details, art would sanctify those. The third appearance of the bogy was in the declaration that there were no more great artists, that the days of Phidias and Raphael would never come again and that the English race was not artistic. He would but mention three such names as Turner, David Cox and Constable, and point to the fact that the art of painting landscape and the practice of water-colours had come from the English school. And the belief that the golden age of art was past arose from one of two causes—despondency or conceit—a conceit which would not acknowledge the value of contemporary work. Let it be remembered that art was a living and growing force, strong enough to shape the destiny of a nation. Were women beautiful only in the time of Helen? Were men exalted only in the days of the Renaissance? The source of the inspiration of those great days was not exhausted, and that inspiration could still be drawn from the common life of men and women for those painters who, having a passionate love of art, submitted themselves to the training of the school.

ECCLESIOLOGIA GERMANICA.

By T. FRANCIS BUMPUS.

*(Continued from page 347.)**Notes on some Steeples in Saxony.*

THE Erfurt churches are extremely numerous—there being a dozen or so equally divided between Catholics and Protestants—but hardly one can be said to possess a steeple which comes up to English ideas of dignified outline. The steeples of the Dom and the contiguous Severus Kirche owe something of their more than ordinary imposing appearance to the elevated situation enjoyed by the churches which they

well as the flanking towers, was surmounted about the time of the re-edification of the choir with crocketed spirelets, the centre one rising above that on either side of it. The present triplet of spirelets is, however, a "restoration," the original group, of which the present one claims to be a copy, having been removed in 1717 after damage by lightning, and only replaced within the last half century.

The steeple of the Severus Kirche is an oblong mass rising at the east end of a nave whose five aisles are included beneath one vast roof. This steeple, much greater in breadth from north to south than from east to west, like that of the Dom, forms the choir on the ground plan, a low apsidal sanctuary projecting beyond. This oblong mass of wall rises in the centre, mounting up into three distinct turrets, each of which is

The Franciscan Church

The Augustinian Church

TWO BELFRIES IN ERFURT.

surmount, but when they come to be examined they are practically nil. The Dom, formerly a Romanesque building (in all probability somewhat resembling Naumburg), was gradually removed, the choir in the fourteenth and the nave in the fifteenth century, and rebuilt on a scale of much greater magnificence, the old Romanesque octagonal steeples flanking the commencement of the choir being, however, left. These had been connected together by a wall after the fashion of the screen façades in the Harz lately alluded to, which wall, as

crowned by one of those very *éclat* slate spires so frequently met with in this part of Germany. A similar example of a triplet of spires in such close contiguity would have been offered by St. Pierre at Louvain, had the façade of that church ever been carried out on the imposing scale in which it was conceived.

Three of the prettiest belfries in Erfurt are those which the pencil of Mr. Hanson has so delicately limned in this instalment of the "Ecclesiologia." They are attached to the three great

churches formerly in the possession of the Augustinians, the Dominicans and the Franciscans, but which are all now Protestantised.

The broad characteristics of these three imposing buildings having been sketched in former numbers of these papers,* any very detailed reference being again made to them is unnecessary. I cannot, however, resist making a few remarks on these extraordinary buildings, the most striking feature in all of which is the absence of any grandiosely dimensioned steeple, their promoters apparently having been content with a graceful octagonal turret affixed to the clerestory, or standing a short distance from it.

In the Dominican church—styled by its Lutheran possessors *Die Prediger Kirche*—the lean-to aisles extend along the whole of its fifteen bays of tall, narrow arcades, being lighted by windows of three divisions, each traceried in the head, with a large trefoil, not included, as generally, within a circle. A door, occurring in the fourth bay from the west on the north side, has the superimposed space between its two square-headed entrances and its arch filled by a large perpendicularising window of four lights. The aisle wall being very tall, there is room for another window above this doorway. This is a Middle Pointed one of four lights, and, like the other windows with which it ranges, presents some of that fine bold tracery which it was so pleasant to meet with in Erfurt after the poorer work seen in Westphalia. The small clerestory windows of two lights correspond with those in the aisles.

Inside, the separation between nave and choir is effected by a coeval stone rood-loft extending the whole width of the church. The choir, with its fine double row of stalls, has a bay intervening between it and the rood-screen, to admit of a free passage to its side aisles—an arrangement which, to the best of my knowledge, is unique. The belfry of this church stands against the aisle wall at the last bay on the south side, a wooden bridge connecting it with the roof of the nave. It is, although unpretending, quite a little gem of its kind.

Turret of the
Dominican Church
of Erfurt

The Franciscan church (*Barfüsser Kirche*), although of exactly the same dimensions as the one just briefly reverted to, differs from it in several small points of arrangement. Here the nave arches are much wider, comprising two windows of both aisle and clerestory. The vaulting, however, follows the divisions of the clerestory, the groining ribs starting from a corbelled shaft between each window, by which arrangement an air of greater length is imparted to the internal ensemble. Here the aisles, to which an appearance of narrowness is given by the greater breadth of the arcades, extend only as far as the sixth nave bay, or, looking at the church externally, as far as the twelfth window, an aisleless choir of four bays, ending like that of the Dominican church in a five-sided apse, shooting out beyond. Externally, no visible separation between nave and choir is afforded, except by the discontinuance of the lean-to aisles, but internally a rather low-pitched arch is introduced to mark the division. The vaulting of the choir is not reduced, but kept at the same height as that of the nave, an arrangement which may be seen in Butterfield's churches of St. Alban, Holborn, and All Saints, Margaret Street, where the chancel arch, with its superimposed space of brickwork, forms one of the most striking features of these historical edifices.

At St. Matthias, Stoke Newington—considered by many to be Mr. Butterfield's most strikingly original London church, and one which on its completion in 1853 caused quite a revolution in ecclesiastical design—the tower, a finely-proportioned "saddleback," forms the chancel on the ground plan. This steeple at Stoke Newington is carried on two arches which, springing from corbelled shafts, span the church transversely. Owing to the great height of the nave, a considerable wall space is left above the western of these two arches. There are no transepts, the aisles being carried alongside of the steeple in lieu of them. The arch opening into either chancel aisle being of the same pitch as those in the nave, supports a clerestory in continuation of the nave one. Thus, a species of lantern is formed over the *chorus cantorum*, which is of the greatest value from an acoustical point of view. Beyond it extends a short, aisleless sanctuary much lower than the nave, its barrel-shaped brick vault rising but little above the apex of the eastern tower arch. But to return to Erfurt after this digression. The aisleless choir of the Franciscan church, with its five-sided apse, is most graceful, and is closed by one of those gigantic tryptichs upon which the Mediæval Germans bestowed so much of their art.

In this church the elegant lantern turret is attached to the clerestory wall at the point where the lean-to aisle ceases. Standing as these two enormously long churches do, parallel with each other, at the distance of but two minutes' walk, they recall by their situation St. James's and St. Mary's churches at Bury, between which, as my readers will recollect, rises the great Norman gateway tower of that once most magnificent and powerful of English religious houses, the abbey of St. Edmund.

Two very notable churches have been raised in the North of London within the last twenty years which will convey some idea of the arrangement of these great Erfurt churches—St. Michael, Camden Town, in the English Middle-Pointed style—Early, with just a *souffçon* of the reticulated as regards its fenestration—and the Roman Catholic church of St. Dominic at Haverstock Hill, edited in that soft, Early Northern French Middle Pointed of which Sir G. G. Scott was so fond, and due to Mr. Buckler. Both churches have their great length of roof unbroken by a turret or *flèche*; the Camden Town example is square-ended in conformity with English usage, the Haverstock Hill church terminating in a lofty Belgian-looking apse.

The Augustinian church at Erfurt is the smallest of these three great structures raised by the Preaching Orders, but it abounds in beautiful Middle Pointed work—especially window tracery—and its belfry, attached to the northern side of the nave clerestory, or rather to the narrow strip of unfenestrated wall which does duty for one, is quite a gem of fifteenth-century German Gothic art, as will be seen by the illustration.

I will now endeavour to describe as graphically and as concisely as possible the leading features of such other Saxon church steeples as succeeded in leaving an impression upon the memory during this tour.

Mr. Hanson's drawing of the western façade of the abbey at Gernrode, which accompanies this instalment of "Ecclesiastical Notes from North Germany," will convey a very fair idea of the type of steeple prevalent in the Harz district. Another very interesting example of the same kind of half steeple, half façade is presented by the Romanesque church of Drübeck, on the line of railway from Harzburg through Ilsenburg to Wernigerode, a locality replete with interest to the student of Saxon Romanesque. This church at Drübeck is a long Romanesque one, with a western apse like Gernrode. Its aisles and northern transept have never been completed. The simple clerestory of small round-headed windows is borne on three round arches with short, thick, cylindrical piers. These nave arcades, as well as the arch destined to open into the northern transept, are walled up, after the fashion of a modern church where funds have not been forthcoming to raise the building *d'un seul jet*. A couple of octagonal turrets with spirelets like those at Gernrode flank the west front which rises far above the apex of the nave roof. This western screen-mass is coextensive with the flanking turrets, and is gabled transversely, as at the Liebfrau Kirche in Halberstadt.

Equally singular outlines are presented by the western aspects of the churches at Luckau and Geithayn, the steeples of the first two being almost completely extinguished when viewed from the east, owing to the enormous mass of roofing that has been thrown over the "hall" churches in their rear. Luckau shows two very dignified Late Pointed brick towers crowned by spires flattened at the top, and of four sides, of which those east and west are of greater breadth than those north and south, terminating in a metal cresting, from the centre of which rises the weathercock. These steeples at Luckau rise two stages clear of the façade between them. This façade is rectangular, and from it a roof slopes off to the breadth of the towers and rests against the front of the nave, whose large stone gable cross is, within a few feet, on a level with the tops of the spires. It is certainly one of the most extraordinary western façades of my acquaintance, this of the

* See *The Architect* October 8 and 15.

Nikolai Kirche at Luckau, and, singular as it may appear to English eyes, has a certain dignity peculiarly its own.

Another of these heavy-roofed Late naves has been built on to the Early façade of the church at Geithayn, a town lying between Chemnitz and Leipsic. Such a ponderous mass has quite dwarfed this church's picturesque pair of western steeples, consisting of towers surmounted by low octagonal spires, not broached, but like that of All Saints, Margaret Street, and St. John's Roman Catholic Church at Islington, spreading themselves out at the base.

The summit of the façade between the towers has, like the Luckau example, a roof sloping off at an angle coextensive with their breadth, to meet the gable of the lofty Late Gothic nave, the apex of whose roof reaches to about half-way up the spires.

Occasionally we find the tall western screen façade in Saxony without the flanking turrets. An instance of this treatment, causing the front to assume the air of a saddleback tower, gabling from north to south, can be seen in one of the

type of church seems to have been pretty generally adopted during the thirteenth, fourteenth and fifteenth centuries. Next to it, in point of purity, we may place portions of the church at Nienburg. The five-aisled Marien Kirche at Muhlhausen is likewise satisfactory, and later on we have such distractingly elegant interiors as the Marien Kirche at Zwickau and the Petri Kirche at Görlitz, both of which have double aisles to their naves. Some of the details of these great fifteenth-century churches, such as their porches, deserve study, though in point of refinement it cannot be classed with our contemporaneous work.

The rich Late Gothic Marien Kirche at Zwickau (a picturesque old walled-town on the line of railway from Dresden to Hof) has a square western tower surmounted by an eight-sided lantern, a species of small broach being introduced to minimise the harshness caused by the abrupt transition from the square to the octagon. This last is finished off with a richly quatrefoiled parapet, from which rise small crocketed pinnacles. From the south side of the tower projects what we should call in England a parvise porch. It is of very rich Late Pointed detail,

West end of the
Church of Gernsode

churches of the quondam cathedral city of Merseburg, between Halle and Naumburg.

That most picturesquely outlined of mid-German cathedrals, Meissen, near Dresden, and so remarkable for its two rood-screens (the one placed beneath the eastern arch of the crossing and the other cutting the long aisleless choir in two), has a rectangular western façade of open Late Pointed screen-work. Doubtless it was intended to soar far above the roof-line, like the gigantic one at Strasburg, but it has never risen beyond the apex of the nave roof, being finished with an elegant quatrefoiled parapet out of which rise small pinnacles.

A small square tower stands to the east of the south transept at Meissen. It afterwards becomes octagonal, has a parapet pierced with quatrefoils, and supports a short Flamboyant open-worked spire, with very pronounced crockets and a huge finial.

This cathedral at Meissen—now Lutheranised—is one of a number of the most elegant churches exhibiting the hall arrangement in this part of Germany, being a good specimen of Saxon Middle Pointed Gothic. Here as in Westphalia this

and serves not only in adding breadth and dignity to the western façade, but forms an important factor in breaking up the outline of a very short but lofty church. Towards this picturesque grouping of parts a circular stair-turret in the angle formed by the tower and the porch in no small degree lends its aid.

The interior of this church at Zwickau affords a specimen of that almost flat vaulted kind of roofing so often employed by the Southern Germans in the fifteenth century. Another example of this is afforded by the Franciscan church at Saltzburg. At Zwickau the groining ribs die off into the sides of huge capless octagonal pillars, which have tall bases, like some of those seen in our Late Perpendicular churches. Somehow or other the spectator is unable to divest himself of the unpleasant impression that these great post-like pillars are thrusting themselves up beyond the vaulting. Despite these vagaries the cross views afforded by this great Late Gothic church at Zwickau are undeniably picturesque, and the same remarks apply to the more delicately pillared five-aisled interior of St. Peter at Görlitz.

NOTES AND COMMENTS.

THE question of ownership of building materials has given rise to much litigation. It was laid down by Lord WATSON that materials provided by the builder and portions of the fabric, whether wholly or partially finished, although intended to be used for the execution of the contract, cannot be regarded as appropriated to the contract or as "sold" unless they have been affixed. But the building owner can obtain the right to unaffixed materials by contract or agreement, or delivery on ground is supposed by itself to confer some rights over materials on him. A case has just been decided at Liverpool in which an ingenious point was raised, for the defence turned on the argument that a building agreement to be valid in such cases required registration. The plaintiff, Mr. W. O. CALLOW, entered into a contract with a builder to sell the land for building purposes on a building agreement which vested the materials brought on the land in Mr. CALLOW, and gave him a right to take possession of and sell the land and materials upon default by the builder in fulfilling his part of the agreement. The plaintiff having taken possession under the agreement, the defendants, Messrs. GALT, EDMUNDS & Co., a firm of timber merchants, with the consent of a partner of the builder, went on to the land and removed certain timber and materials which they had supplied to the builder and for which they had not been paid. The plaintiff thereupon brought this action for trespass to the land and for conversion of the timber removed by the defendants. It was held by Mr. Justice BRUCE that the decisions in *BROWN v. BATEMAN* and *REEVES v. BARLOW* applied to the case. In them it was held that the moment materials were brought upon premises the property in them passed in law to the building owner, and that an agreement respecting them was not a bill of sale, and did not require registration. His lordship thereupon gave judgment for the plaintiff for 60%, the agreed value of the timber removed, in addition to 1% paid into Court in satisfaction of the trespass.

THE little Temple of Nike Apteros, or Wingless Victory (*i.e.* loyal to Athens), in the Acropolis of Athens, is generally supposed to have been erected when CIMON was in power. Although it was visible in the eighteenth century, when WHELER and SPON visited Athens, the temple was subsequently demolished. In 1835 some explorations were undertaken which were successful in unearthing several fragments of builder's and sculptor's work. A restoration was accomplished by SCHAUBERT and ROSS, which suggests the charm of the temple when it was perfect. The building was supposed to commemorate the victory in 466 B.C. on the Eurymedon, when on one day two hundred Persian ships were destroyed, and immediately afterwards the invading army was defeated. But from inscriptions lately discovered, and which were produced for the first time at the WINCKELMANN celebration in Athens on the 9th inst., it would appear that the building is twenty years later in date, and would therefore be one of the works undertaken by PERICLES. The name of KALLIKRATES is given as architect. He co-operated with ICTINOS at the Parthenon.

Two competitions were arranged in July for almshouses at Brocco Bank and a convalescent home at Whiteley Wood, which were to be erected under the will of the late GEORGE WOOFINDIN. The two were restricted to members of the Sheffield Society of Architects and Surveyors. Mr. E. M. GIBBS was appointed assessor for both competitions. Five sets of drawings for each building were received on October 22. Mr. GIBBS, after examination, reported to the Trustees that while all the "instructions" were conformed with, "none of the competitors have conformed with all the 'conditions,' and that my duties being so clearly defined, I have to exclude the whole five sets of designs. Some do not conform with the condition as to expenditure, and others do not conform with the condition that the description and specification of materials is to be letterpress or typewritten, as handwriting appears." Mr. GIBBS said he did not know of any previous competition where all the designs were excluded, and, under the circumstances, he recommended the Trustees to divide the four premiums of 50% each into five of 40% each, in order that each competitor might receive one. The "relative merits" are as follows:—*For the Almshouses.*—First,

Mr. W. R. BRYDEN, architect, Buxton; second, Messrs. HEMSOLL & PATERSON, architects, Sheffield; third, Messrs. W. H. LANCASHIRE & SON, architects, Sheffield; fourth, Messrs. GEORGE SAMPSON & SON, architects, Sheffield; and fifth, Mr. FRANK WILSON, architect, Sheffield. *For the Convalescent Home.*—First, Messrs. HEMSOLL & PATERSON; second, Mr. H. W. LOCKWOOD, architect, Sheffield; third, Messrs. HOLMES & WATSON, architects, Sheffield; fourth, Mr. W. R. BRYDEN; and fifth, Messrs. GEORGE SAMPSON & SON.

THE device of the city of Paris, an ancient boat with the motto "*Fluctuat nec mergitur*," so well suggests the participation of victory over foreign enemies, it should have obtained more general recognition from artists. M. ZOLA must have been thinking of the neglect when he made Claude Lantier in "*L'Œuvre*" paint an allegorical subject of a nude woman standing at the prow of a boat on the Seine. It is now proposed to erect on the Ile du Vert-Galant, near the Pont Neuf, an immense representation of the arms of the ancient Lutetia. The idea is due to M. MONCEL, and he has had the aid of M. GRAVIGNY, architect, and M. LAGRANE. M. BOUVARD, the director of municipal works, has given them much advice. The memorial will be about 20 metres in height. The vessel will resemble an ancient galley with a high prow, and the deck takes the form of a fortification, from which rises a pedestal resembling a capstan. On the latter is a globe supporting a figure of Paris, which will be 8 feet in height. The expense, it is said, will not exceed 400,000 francs. The vote for the money has yet to be passed by the Municipal Council.

APPARENTLY the competition for the Harrisburg Capitol, Pennsylvania, although supposed to be decided in the American courts, can still afford material for future litigation. It will be remembered, says the *American Architect*, that six architects were specially invited to submit designs, and were promised, in consideration of their doing so, compensation to the extent of 1,000 dols. each. This compensation, we are told, will probably be withheld from five of the six architects in question, on the ground that, as their designs could not have been executed without modification for 550,000 dols., they have violated their part of the contract and are not entitled to require from the State performance of its part. The sixth competitor, whose design could, it is claimed, have been carried out for the sum mentioned, and will therefore, according to the story, receive his 1,000 dols., is the one whose drawings were excluded from competition by the experts, on account of their violation of the terms of the programme. The agreeable impression which this proceeding is calculated to produce upon the profession is likely, it seems, to be intensified by the determination which is said to have been taken by the Capitol Commission, to refuse to pay the expert jurors the agreed compensation for the time and trouble which they expended in examining and reporting upon the competitive designs.

THE reconstruction of the Royal Infirmary in Glasgow which is to be a memorial of the Jubilee year, has been for some months under consideration. A block plan has been prepared by Mr. JAMES THOMSON, architect, according to the instructions of the committee. It shows four detached blocks, running east and west, almost parallel, and connected by a corridor of one storey. At the eastern part of the site it is proposed to place the kitchens, engine-house, &c., besides an additional ward for special cases. The committee have approved of the plan, which is to be submitted to the directors, who will hold a conference on the subject.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of this Association was held on Friday evening last, Mr. Hampden W. Pratt, president, in the chair.

The following gentlemen were elected members:—Messrs. C. M. E. Armstrong, J. F. Bull, C. H. H. Henman, A. C. Notley and C. Newborne.

A vote of condolence was passed to the relatives of the late Mr. Pearson.

Mr. L. A. Shuffrey read a paper on

House Decoration.

The invitation which I received from the committee to read a paper before the Association was accompanied by the suggestion that the subject should be "House Decoration: the Preparation of Surfaces," from which I understood it to be desired that I should treat the subject from the practical rather than the æsthetic side. This I shall endeavour to do, confining myself mainly to the skin or surface which appears to the eye and the preparation of the ground to receive it. You will doubtless agree with me that the subject is an important one, as the most regular features will fail to please if disfigured by a bad complexion, and the most ordinary be made attractive by a good one; a shining nose will not compensate for dullness of the eyes, teaching us not to get up a shine in the wrong place.

The trade "painter" hardly gets its share of attention in many specifications, and the description "clearcole and distemper ceilings, hang paper at so much per piece, and paint all work usually painted four coats of good oil colour," will not insure a good result in the hands of the ordinary contracting builder.

For many years the tendency has been towards depending upon manufactured wall and ceiling coverings rather than upon hand-painted decoration, panel and pilaster treatment, and arabesques, until the practical painter who can carry out work of this kind has become a rarity. In fact, decoration is now done mostly by selection, which has advantages in the saving of time, but does not tend to elevate the workman and to give him interest in his work.

A difficulty in the painting trade is that fluctuations of work at the different seasons of the year have a demoralising effect upon the men. When work is slack many are thrown out of employment, and when busy others are taken on who can just handle a brush, but who have served no proper apprenticeship to the trade. It is absolutely necessary to the successful carrying out of a job that a skilful and experienced foreman painter should have charge of it, whose duty it should be to control the execution of the work, mix all materials, see that proper tools and plant are used and taken care of and that rubbish is cleared away from time to time and the rooms kept clean.

I do not propose to go into the proportions of the mixtures of materials to be used, as I could not give information on this subject from actual experience; it would probably be tedious for you to listen to, and it is a part that an architect can hardly be expected to remember, and must leave to the foreman painter. It is, however, a great convenience, and commands respect from the workmen, to be able to take palette and knife in hand and mix the tint required on the job. In so doing it is very desirable never to use a colour or vehicle without knowing its name and qualities, as the experience gained thereby will be very serviceable. It is difficult to gauge the amount of time this mixing of tints will take, and I can say from experience that it is desirable not to make a following appointment too soon after.

In the progress of a new building you have no doubt, when visiting the works, been suddenly confronted with the question from the foreman of the job, "What colour are we to paint the outside woodwork and the down pipes and gutters?" and in making the design you will very likely have mentally disposed of the questions whether the frames and sashes should be white, the down pipes green, whether the iron gutter running along the extreme projection of the heavy overhanging main cornice should be treated as a member of it, at great inconvenience on account of its falls, or to a quite different colour on its own account; whether the outside timber framing, if any, shall be coated with Stockholm tar, in strong contrast to the white plaster panels treated with a coating of boiled tallow and lime; and whether the bargeboards or verge mouldings shall be light, like the sashes, or dark, like the framing; whether the front door shall be dark, and, if so, shall the solid frame which surrounds it be the same. The raising of these questions should be a hint that the inside colouring will be coming on shortly for determination, and a scheme of colour for the various rooms should be thought out.

The principal objects of painting are to preserve the material painted, to produce a surface which can be kept clean and to give it a beautiful appearance. When applied it must become hard, and must adhere firmly to the substance painted. It is desirable, if not absolutely essential, that it should retain its colour, as although many beautiful effects come through

change and exposure, they are generally due to the disintegration of the surface, or decay, which can only go on for a limited time. Many of you may have admired the greenish-blue colour, originally a common green, of an old garden gate; but if you examine it for the purpose of imitation you will find that the colour eludes you, being made up of different coloured particles which you cannot match. The pleasant pinky red of old cart-wheels, which looks so nice in a farmyard, is a cheap vermilion which has faded. Tints should be made stronger in outside painting than at first desired to allow for some diminution from exposure, which will most certainly occur, and for the reason that colours are softened by the atmosphere. In this respect colours vary very much, losing less as they increase in warmth. A soldier's coat will appear its reddest on a foggy morning.

White lead, *i.e.* carbonate of lead, ground with linseed oil is the principal ingredient used in painting, and it is important that the best quality should be procured. It has more covering power if kept for some time after manufacture. It is capable of adulteration, but I am not acquainted with any simple method of testing its quality, except that any adulteration would be lighter than the lead, and thereby increase its bulk. It is a drier, and can be relied on when mixed with turpentine alone; but it is found for convenience of working that a proportion of linseed oil should be mixed with it and a small quantity of drying oil varnish.

A purer white than white lead is zinc white, oxide of zinc, but this lacks the requisite covering body possessed by white lead, and is used mostly for finishing pure white or delicate tints. It is more permanent than white lead, and is not poisonous.

Where a pure white is required the ground can be brought forward with two coats of white lead, then one of half white lead and half zinc white, and finished with zinc white, light copal varnish and turps.

The principal vehicle used in painting for mixing with white lead and colours is linseed, the natural oil expressed from the seed of flax; it should be yellow, transparent and sweet to the taste and have little smell. It has a tendency to darken in colour after drying. If opaque, acid to the taste and with a rancid smell, it is not of good quality. It is an indifferent drier, but when mixed with white lead the drying properties of each are improved thereby.

Boiled oil is linseed oil boiled with litharge, which makes it a good drier, but darkens the colour so that it is only suitable for dark colours. It is much used for outside work.

Turpentine is a volatile oil distilled from the resinous oil of fir trees and is very useful as a solvent and a medium in combination with other substances. It has a bleaching quality, and to some extent corrects the tendency of drying and expressed oils to discolourment. By the over use of turps a coat of colour may be made too thin to be of much service. The residuum, after the distillation of the oil or spirits of turpentine, is the common resin or rosin of commerce.

Varnish is used to make colours hold out to their full brilliance of hue, also as a protection. It varies very much in quality, and it is best to specify that of the best-known makers. The most serviceable are the oil varnishes, which dry by oxidation of the oil and form a transparent skin over the work. For outside work an elastic varnish should be used, which will not readily crack. In applying varnish it is necessary to see that the surface should be free from dust or grease. Flaking varnishes are supplied by the manufacturers intended to dry with a dull gloss, but there is some uncertainty about them and many painters prefer to mix some varnish with the last coat of paint to produce this effect.

Exterior.

The earliest opportunity of a fine day should be taken advantage of to paint all the external wood and ironwork, the priming having been done before fixing. The woodwork, if it be a light colour, will require four coats of white lead, mixed with linseed oil and driers; if to be finished a dark colour, boiled oil, which is a better drier, should be used. It is requisite that outside painting should possess good body. For external ironwork, paint composed of oxide of iron and linseed oil is the best protection. In cases of engineering works which have been sent abroad, ironwork which has been painted with oxide paint has stood much longer than similar work with red lead.

A drawback to the use of oxide paint is that the range of colour is limited, being principally red, which, in the case of a red brick house, is the last colour one would desire. Other colours can be obtained by mixing, but the protecting qualities of the paint are reduced thereby. All gutters should be painted inside as well as out. A painted front door to a house if exposed to a sunny aspect is a constant source of expense, as the paint soon cracks and blisters, and has to be burnt off down to the wood each time it is repainted. A practical painter has told me, speaking from actual experience, that if zinc white is used entirely instead of white lead this will not happen. The plan of recessing the front door or providing an outside porch

has the double advantage of providing shelter and protecting the door from the sun's rays. The front door being the most noticeable feature of a house calls for special attention, and should be well rubbed down and have two coats of varnish. A well-painted front door with hand-polished brass fittings bespeaks a well-conducted house.

In the case of town houses, cemented or stuccoed fronts often have to be treated, and this is generally done with oil paint; it is a heritage left to us by a former generation, and we must make the best of it. The only satisfactory feature about painted cement-work is that it keeps the wet out. The money spent on the painting of cement fronts in London would have paid for the use, in many cases, of Portland stone or rubbed brick—the two materials which, in my opinion, are pre-eminently suited to the London atmosphere. Fresh Portland cement is the greatest enemy of oil paint and should not be painted for two years. When cement is left from the float with a granular surface it has a pleasant enough appearance, but it gets so grimy in time painting in oil is resorted to, and this looks very well until successive coats have filled up the grain, which then has an unsatisfactory reflecting surface, cracks appear which have to be stopped, and as Portland cement cannot be painted with safety until it has stood about two years, these cracks have to be repaired with Roman cement. A distemper which will stand the weather would be the solution of the problem. This merit is claimed for Duresco, and provided that it is used under favourable conditions as to weather, so that it has time to harden, I consider it very suitable for outside stucco.

The clubs in Waterloo Place are an illustration of the treatment of stucco. The United Service in its natural colour is depressing in the extreme. The Athenæum, with its white painted dressings and grey distempered walls, shows about the best which can be done with it; and the Travellers' is an illustration of how a good design suffers from being executed in an unworthy material. The conclusion which I come to is that Portland cement facing is not suitable for London. For reasons of economy, outside painting should be limited in extent as much as possible; woodwork should be painted every three years with good white lead and linseed or boiled oil, special care being taken to see that the surface is dry and free from dust when it is applied.

Interior.

In dealing with the interior of the house, I propose to take the parts of the rooms in the order in which they are usually painted—ceilings, woodwork, walls and floors.

Ceilings give the decorator more trouble than any other part of the room, for various reasons, the principal being the cracking of the plaster. I have no doubt you are all familiar with the maps of rivers which present themselves when you look at the ceiling on a bright morning a year or two after a house has been built, caused partly by the shrinkage of timbers or vibration from persons walking on the floor above, defective sand, lime or hair, or by the floating and setting coats following too quickly after the rendering, before it has had time to get thoroughly dry. To prevent this important ceilings should be lathed on cross battens or ceiling joists fixed beneath the floor joists. If ornamented, the most convenient plan is to make them of fibrous plaster, the method being to make models of the various parts, and then from plaster, wax or gelatine moulds make their casts of plaster-of-Paris which have embedded in their thickness canvas and sawn laths of pine, in places where required for strength or fixing. These slabs are then fixed to the battens with screws, and the joints made good with plaster and canvas. Existing ceilings can be covered up by fibrous plaster screwed to the lath and plaster, provided, of course, that the latter is sound. Brass screws should be used, as iron ones rust and stain the plaster.

Ceilings on the underside of floors composed of iron and concrete can be plastered right on to the concrete if the boarding on to which the concrete is thrown is kept down low enough beneath the joists for the concrete to pass under. Cracking sometimes occurs through the iron joists being run into flues, and the expansion and contraction of the metal caused thereby. In fixing ornamental ceilings of fibrous plaster, battens should be used nailed to the concrete. The most usual method of finished ceilings is in distemper or tempera. In the case of new work the surface should be clear-coated, *i.e.* washed over with a coat of thin size and whiting, and a little alum, having previously removed all excrescences. This is to make the absorption equal all over the surface. The distemper is made by dissolving the best whiting in clean water until it is of the consistency of thick cream, and perfectly smooth to the touch, to which should be added prepared size, previously warmed, and the necessary colour, the colour being separately rubbed up with some of the distemper; the whole should then be gently mixed together and strained through a coarse cloth or metal strainer. When allowed to set it should be of the consistency of jelly, in which condition it should be applied to the ceiling.

As distemper changes its colour very much in drying, it

should be tried on a piece of white paper and allowed to dry. The drying may be assisted by holding it against the face or back of the hand, but not by holding it to the fire, which would prevent its drying its natural colour. Having procured the right tint it should be applied quickly to the ceiling with large brushes, preferably by two pairs of hands. For high-class work distemper is frequently stippled, taking care not to go over the same part twice. There should be no draught in the room whilst this is in progress, but when completed the sooner it is dried the better. If this operation is successfully carried out, a very pleasing effect is obtained. Even with experienced hands distempering is not always successful, particularly if done during foggy weather. If it does not dry out evenly it should be washed off and redone.

If dealing with old ceilings the distemper must be washed off right down to the plaster face, all cracks raked out and stopped with putty (plaster-of-Paris and distemper mixed), and the whole rubbed smooth with pumice-stone and water; stained parts should be painted with oil-colour and the whole clear-coated and distempered as before described. If old ceilings are in bad condition it is desirable that they should be lined with paper, which should have a coat of weak size before being distempered.

Distemper is superior to oil-colour in the clearness and delicacy of its tints, and in that it does not discolour in the same way with age. It is also very much cheaper. Its demerits are that it will not bear washing, and, being thick, it soon chokes up delicate mouldings or ornament; it is, therefore, the custom, where there is a considerable amount of elaboration or ornament, to execute the work in oil-colours, either flatted or flat varnished. This in a country house, or where no gas is used, will last a great many years, and bear washing and touching up. If dealing with ornament in relief, it is a good plan to paint the work twice with oil-colour and then distemper it. The distemper coat rather pleasantly softens the ornament, and can be washed off down to the oil-colour when the work has to be redecorated.

Some of the coarsely-modelled ornament of the Jacobean period may owe its charm to the indistinct suggestiveness caused by successive coats of distemper, but it is hardly desirable to aim at an effect of this kind.

The style of ornament which we understand as "Adam's" is often executed of composition fixed with tacks and glue in small repeats on a plain ceiling previously lined with paper. This is a very refined style of ornamentation, and is often pleasantly relieved with painted medallions, in which case a parti-coloured treatment is desirable to hold up the medallions in appearance and prevent their spotting too much. The light to a ceiling is to a great extent from a horizontal direction and the amount of relief should be tried in position. Ornament, whether in relief or painted, should be simple, and depend rather upon graceful lines than upon elaboration.

Covering a ceiling with a pattern paper is a simple and satisfactory way of treating it. The pattern should be centred with the room and the joints carefully butted. Stamped materials for ceiling coverings are numerous, and by their use an exceedingly elaborate effect can be obtained at a very moderate cost. The best are they which do not imitate plaster-work. They are very useful for strengthening and hiding the defects of old ceilings in a bad condition, but have not the individuality which can be procured by even a little plaster ornamentation designed for its special position, and I look upon them as suitable rather for old than for new buildings.

The plan of hanging a heavily flocked paper on the flat of a ceiling and painting it is a good one, and the effect is much improved if a flat band forming a frame to it next the cornice can be arranged so that the ornamented portion has a recessed appearance. This flat band was much affected during the Greek revival period, and often had pateræ fixed on it at intervals.

In applying to an old ceiling either ribs or any relief ornament which has strongly pronounced straight lines, it is necessary to apply a straight-edge to the surface to ascertain whether it sags or undulates, otherwise you may find that what appeared level before becomes like the waves of the sea.

Woodwork.

Painting on new woodwork will require at least four coats, and it is better to specify five, as on joinery well prepared four is only just enough.

If it is desired that the woodwork of a house should be painted, and not stained and varnished, a process which I am thankful to believe has almost died out, the knots should be covered with patent knotting to prevent the resin discolouring the succeeding coats of paint; or, if bad, they should be cut out or covered with silver leaf. Before the work leaves the carpenter's shop it should be primed with red or white lead, mixed with linseed oil and turps, to prevent its being affected by a damp atmosphere. Backs of panelling or any woodwork which has to be fixed against a wall, should have a thick coat of oil-colour before fixing. Before the next coat is

applied the surface should be lightly rubbed down with glass-paper, and the brad-holes, open joints or cracks filled with hard stopping, and the dust removed. The second coat, mainly of linseed oil and white lead, should then be applied. Any filling up required should be done after the second coat. In new work and if the joinery has been well prepared little will be required. It consists of a paste made of plaster, whiting and size, and is required to level up hollow places. Three coats are required after filling up. The third coat, which is the ground for the finished colour, composed of white lead and linseed oil and turps in equal proportions, and with an approach to the finishing colour, should be evenly laid on, the direction of the brush following the direction of the grain of the wood. Some judgment is required in selecting the ground colour, as the finished coat will be affected thereby; in many cases a brighter colour may be used than finished colour, with advantage. This should dry out uniformly, and if it does not do so should be repeated before the finishing coat is applied. By mixing varnish with the finishing coat an egg-shell gloss is obtained, and this is the finish which appears to me most suitable for work generally. It does not require so much preparation as varnished work, does not show up slight unevennesses and will bear washing. It is sometimes called a bastard flat. If it is desired that the surface shall not shine at all, it will require a flattening coat of the required colour mixed with white lead and turpentine only. Flattening should follow the previous coat about twenty-four hours after, before it has had time to get hard, so that it may be incorporated with it, and the more shiny the previous coat the more dead will be the flat. Flattening is easily soiled and will not bear washing. As it dries very rapidly it is necessary that it be done quickly, and without break, something like putting on a large flat wash of water on a drawing.

Old work should be gone over with the stopping knife, then rubbed with pumice-stone and water; greasy parts should be washed with turpentine, and, where the paint is rubbed away, primed; cracks or holes should be stopped and hollows filled up, being left full to allow the stopping to shrink, and then levelled off afterwards. The first coat should be mixed with turps, and the succeeding ones as before described. Wood-work intended for varnishing requires extra care bestowed upon it from the beginning to secure an absolutely smooth surface, and after the fourth coat should be applied one or more coats of French oil, varnish or pale copal for delicate tints, being rubbed down between each coat with pumice-stone, powder and water, and a felt float to remove all inequalities. This can be repeated until the work has the finish of a coach panel or Japanese lacquer tray. Work of this kind is expensive, but very durable, and should be designed with this finish in view with very simple mouldings and large plain surfaces. It is, in my opinion, only under these conditions that internal varnished work is tolerable.

It would be unwise to treat the work of a new house in this way before it had got over its infantile diseases. If it can be so arranged, a good plan is to leave a house with three coats of paint and lining papers on the walls for a season or two, when the finishing decorations can be carried out with the satisfaction that they are being executed on a good basis. Often the contractor who builds the house is not the best man to employ for the decoration, and one set of men is conveniently got rid of before the other commences.

Some of the most beautiful colours can only be obtained by "glazing," the term given to painting with a semi-transparent colour mixed thin over an opaque colour. This is generally done with tube colours.

In treating of house-painting the subject of graining should not be omitted, although out of favour at the present. Personally I dislike it, mainly for the reason that I rarely meet with any that is pleasant in colour. The merits justly claimed for it are that it wears well on account of its broken colour and varnished surface, and can be easily touched up without repainting. I see no reason why combed work, in colours not necessarily resembling wood, should not have a good appearance; also the merits claimed for grained work. Another plan is to stipple the second colour and then varnish.

Walls.

New walls, if intended to be painted, should be plastered with Parian or Keene's cement, and should have two coats of white lead and linseed oil and litharge mixed rather thin to soak into the plaster and stop absorption; the third coat should be thicker and mixed with spirits of turpentine and colour, and the fourth thicker still and mixed with equal parts of linseed oil and turpentine, with sugar of lead as a drier. The colour should be darker than intended to be finished, each coat should be allowed to dry thoroughly before the succeeding one is applied, and should be well rubbed down with glass-paper. The finishing coat is best stippled with large flat brushes, as a granular surface is obtained, the wearing properties are not impaired, and the unpleasant reflecting surface is broken up.

The internal walls of large rooms and passages are best left from the trowel with a granular surface.

Any appearance of damp must have the cause removed, as no tinkering with the face of the wall will be a lasting remedy.

Any patching or chases should be made good with Parian or Keene's cement, which can be painted soon after, provided that the bed or backing has been first painted with oil-colour to prevent the damp from the cement soaking into it.

It is claimed for Adamant plaster that it can be painted in twenty-four hours, but my experience of it is that this cannot be done with safety if cement has been used in the wall or floor, as the salt from the Portland cement will continue to come through for weeks after the plastering is done. The manufacturers recommend a wash of barium chloride, but this I have not tried.

Another trouble which affects the finishing of walls is discolouration in patches where Fletton bricks have been used. I have spoken to the manufacturers about it, and am informed that it is caused by using overburnt bricks, and that a brick-layer experienced in the use of these bricks would not make use of these overburnt ones for inside work. Considering the very large quantities now being used in London in place of stocks, it is very important that the matter should be understood, the only remedy being to cut the brick out.

Wall-papers.

The most convenient way of finishing walls, and that most largely adopted, is covering them with printed wall-papers. It is a simple process, and may be quite inexpensive, and they are easily cleaned off and renewed. Skilful paperhangers are not difficult to find, so a badly-hung wall-paper should not be tolerated. The surface of the wall should be rubbed over with glass-paper to remove all excrescences, and it should then be clearcoiled, and the papers hung without joint from top to bottom, having their joints carefully trimmed and butted. On new walls it is a good plan to hang white lining paper preparatory to hanging a more expensive paper; this gives the latter a much better chance as far as discolouration from the fresh walls is concerned. Walls should be lined with brown paper before hanging embossed or strong papers, as otherwise they are liable to slide in shrinking, and open at the joints. It is a good plan also to line and clearcole preparatory to distempering walls; it has an advantage over using a tinted paper, as the joints need not show, which they would do in the case of the latter.

The varieties of wall coverings which may be suitably used for the space usually called the filling are numerous. Immense talent has of late years been employed in the designing of wall-papers until we almost have more than enough, and there is a temptation, when choosing from a number of ambitious designs, to forget that in most cases the wall on which they are to be hung should be looked upon as a background—a purpose for which many of them are eminently unsuitable, and if there could be more connection between the designing and the using of them, the designs and colourings would be very much modified. I am not now referring to the large flowered designs in natural colours which are exhibited in drapers' windows, accompanied by the notification that they can supply the chintz for hangings to match. A less interesting arrangement I cannot conceive. A piece of English wall-paper is 12 yards long by 21 inches wide, containing 63 square feet. French paper is 9 yards long and 18 inches wide, containing 40½ square feet; so in estimating the quantity required half must be added to the measure for English papers, and the price considered in relation thereto. The simplest wall-paper consists of a pattern printed from a wood-block, in repeats, with distemper colour on previously distempered rolls of white paper, and in this form is suitable for use from the servants' bedroom to the principal reception-room, the dignity required depending upon the form of design and colouring, and if we had nothing more than this we should still be very well off.

The varieties of embossed coverings for walls now available in decoration are numerous, and I have thought it the best plan to exhibit specimens, and make any remarks about them which occur to me.

They have the merit, when hung on an ordinary plaster wall, of presenting a wearable surface, and one that is capable of decoration after hanging in various ways, either by painting all over, parti-colouring, rubbed out or stippled effects. The skill displayed in the Japanese leather papers in design, modelling and treatment of the surface with metal and colours made them very popular, and they have been used in place and out of place until we are rather overdone with them.

A luxurious finish to a wall is covering it with silk damask or brocade, and this plan can be adopted with more propriety now the electric light is more general, and the dirt and discolouration from gas got rid of. It may be treated as a continuous band round the room, or introduced in the form of panels.

In either case it should be so arranged as to have a solid

back to prevent the accumulation of dust behind it and to enable it to be brushed.

Lastly, I may refer to the hanging of real tapestry, which I consider has a value beyond any other wall-covering, either as covering the entire wall, suspended from the top, or in panels. No other decoration is required, and a tinted white for the woodwork appears to give the best value to the tapestry colours.

Following the order which I first laid down, we come to floors. The ordinary deal floor, by the process of building, gets so stained and disfigured it is necessary, if any part is intended to show, to stain it a dark colour and varnish it. A border around the room enables a reversible square of carpet to be used, which is easily taken up and shaken. The reception-rooms should be laid with solid oak or $\frac{1}{4}$ -inch parquet over the ordinary floor, which makes a very good job, provided the floor has got to its normal condition. It is best deferred for a season, as the best flooring will sometimes swell and buckle, when, if laid, the parquet will follow it and present a series of corrugations. The usual plan for finishing the oak is to give it a "stiffener" of French polish, and then brush over with bees'-wax and turpentine. Waxing without the polish is slippery and does not keep the dirt out. Plain linoleum of its natural reddish-brown colour will be found serviceable and pleasant for many of the secondary rooms of the house; it is very durable, and although I have heard something said about its rotting the boards through excluding the air, I have never found this to be the case.

Natural Woods.

Oak, if left its natural colour without varnish, gets dirty where in contact with much wear, as in living rooms, and if French polished of its natural state a light yellow colour is produced which it is not easy to decorate to.

The best plan is to darken it by fumigating with ammonia by the dry process, as it does not raise the grain; it can then have a stiffener of French polish, and be finished with bees'-wax and turpentine. No liquid stain should ever be used to stop up and dirty the pores of the wood. Mahogany is pre-eminently the wood which is improved by polishing; good wood may be left its natural colour of a golden brown, but if a darker colour is desired it can readily be done without the beauty of the wood being destroyed. The dark purple colour so much affected by makers of antique, and called imitation rosewood colour, which it is not, is most objectionable. The difficulty comes in with mahogany where there is any carving to be treated; as to polish, carving ruins it, and you must either give up your carving or your polish. A compromise is sometimes arrived at, and the whole is dull polished. The makers of furniture at the end of last century no doubt realised the difficulty, and we find sideboards inlaid and without projecting mouldings, so that the whole surface could with fitness be very highly polished. Walnut gets most of its beauty from polishing, the same as mahogany. Pine and pitch-pine are not pleasant woods polished, as it brings out a hot yellow, which is most difficult to decorate to, almost demanding a strong scheme of colouring to make them harmonise. American ash and basswood take a green stain very well; but the colour fades, and if in positions where there is much wear the wood soon gets shabby. Trying to make a common material look like a rarer one does not often pay in the long run.

Before going on to the subject of colour, I may sum up in a few words the processes which I have been describing, omitting for want of time descriptions in detail of the materials, pigments and vehicles used.

Surfaces which have to stand wear should be painted with oil-paint, composed of white lead, linseed oil and driers.

Surfaces which do not come in contact with any bodies may be treated with less labour, and as good an effect with distemper composed of whiting and size and the necessary colour.

Oil surfaces may be made more durable by varnishing, the degree of finish being a question of labour and expense.

It is important for the stability of painted decoration that pigments of a fugitive nature should be avoided as much as possible, also that their chemical action when mixed one with another should be understood, and this subject has been treated of by Mr. W. J. Muckley in one of the handbooks of the Science and Art Department at South Kensington Museum. He therein gives a list of permanent, semi-permanent and fugitive colours, and practice might very well be confined to the use of the first two classes, if not of the first only. As house-painting must necessarily be renewed, there is not quite the same necessity for permanence as in a painted picture. The simpler the mixture of colours to produce the required tint the more likely it is to be satisfactory and to keep its colour. I have read that the "quickest way to good colouring is through a short palette."

The theory of colour is treated exhaustively in the work of M. Chevreul, an eminent Frenchman, "The Principles of Harmony and Contrast of Colours," and to those not acquainted with it I would recommend it as a winter evening's amusement, as also the works of Owen Jones on the same subject, with his series of propositions on the principles which should govern

the decorative arts; but the best study for colour is the book of nature, and to an enthusiastic student her instruction is infinite. Suggested schemes of colour are all around us. Combinations of clouds, the spring and autumn tints of trees, with their leaves back and front for colour or texture, fruit and flowers, the plumage of birds, vegetation on buildings, oxidising of metals, marbles—all present beautiful combinations which may be made use of, and an enthusiastic study of colour in the ordinary walks of life will well repay the time and attention given to it. When an impression has been received, take the earliest opportunity of registering your recollection of it with your colour-box; it will then be ready for use when the opportunity occurs.

In a satisfactory scheme of decoration the three primary colours, yellow, red and blue, should be in some degree represented, not necessarily on the walls of the room, but supplied by the hangings and furniture. They need not be represented in their primary condition, but in the form of secondaries and tertiaries. I should say that the most useful colour for the background or walls is green, contrasting with the furniture of yellow or red browns, with blue introduced in the hangings.

Yellow being a primary colour cannot be produced by mixture of other colours; it is an advancing colour, has great power of reflecting light, and, compounded with red, gives the range of warm colours, orange and brown. It diminishes in power by artificial light, and for that reason is difficult to make satisfactory for both day and night effects. It is a delicate colour as a pigment, and is easily killed by admixture with other colours. It contrasts powerfully with black, and may be represented by gold in a colour scheme.

Red is the intermediate primary coming between yellow and blue, and in like intermediate relation also to light and shade, white and black.

It is a most positive colour, forming in combination with yellow the secondary orange range, and with blue, the secondaries purple, crimson, &c. It gives warmth to all colours, especially to yellow. In combination with yellow it becomes advancing, and with blue retiring. It is very much affected by the quality of the light in which it is viewed. Reds easily spoil one another side by side, and great skill is required to print one red on another. Red lights up by artificial light better than any other colour. Vermilion is the pigment which most nearly represents this primary.

Blue is the third primary, and the coldest of colours. It is best represented by the genuine ultramarine, which is said to be a true colour, neither inclining to yellow nor to red. Blue is a retiring colour. The blues most used, on account of the high price of genuine ultramarine, are cobalt and Prussian blue; but the former inclines to purple by artificial light and the latter to green. These colours are very useful and pleasant in light tints for making greens, but as blue lights up so badly, it may well be represented in the colour scheme by curtains or carpet.

Having gone through the usual processes in the decorating of a house, I will proceed to consider the points which should influence us in settling on a decorative treatment, and will commence with the vestibule. For the walls of this an excellent plan is to line to a height of about 4 feet with Dutch tiles, leaving the brickwork above, or if too dark this may be tempered on the brick with a stencilled pattern. The dado may go down to the tile floor without plinth and all be washable. If the house be sufficiently large the entrance hall often becomes a room, with its entrance lobby screened off and the staircase recessed from it or leading off from one side. It may contain an open fireplace, and the doors to the principal rooms open immediately out of it; it is therefore desirable that the colour should be considered in reference to the adjoining rooms. As the sunniest aspects are required for the living rooms, that of the hall is likely to be a northern one, and consequently a warm colouring would be best—a high wall panelling or dark wall treatment to about the level of the top of the door architrave, with deep frieze of stencilled ornament in red tones, with an olive cornice and the ceiling a lighter tint of the same. There would be very little blue or cold colour in this arrangement, and the fireplace might supply this in the form of blue tiles on a white ground and the grey metal of the stove. The old-fashioned crimson, blue and green Turkey carpet would complete the colouring, bordered by a parquet floor, yellow stain being introduced in the window-glass. The red colouring could be carried up the staircase above a wall panelling, repeating the handrail on the wall side, or in the absence of this a wood moulding at this level, with the space below painted a greenish brown on a simple pattern embossed paper. This gives a durable surface where the wall gets most wear, and the papering above may reasonably be left unvarnished, as, except on the score of durability, varnished papers have nothing to recommend them. The varnish changes colour, and becomes in most cases very unpleasant, and is more susceptible to changes of temperature than an unvarnished paper, a sudden change from a cold day to a hot one covering the walls with moisture. An oil-printed paper on an oil ground is a good substitute, a pattern which I have here, as it is pleasant in

appearance and can be sponged without harm to it. We seldom now see the walls panelled out in plaster or wood. It has a good architectural character, and it is astonishing what can be done with a few hundreds of feet of wood moulding judiciously disposed on the walls. It is tedious making a drawing of the four sides of the stairs, so the best plan is to set out the panels on the walls with a piece of chalk. Everything above dado level can then be distempered. Duresco is a good material for the purpose, using the petrifying solution supplied with it. It is more expensive than ordinary distemper, coming between that and oil-paint, but has the merit when hardened of being to some extent washable, and it is much less liable to discolouration from defects in the walls than ordinary distemper. It is also pleasant in appearance. The treatment of the wall panelling suggested applies rather to old than new buildings.

In considering the horizontal divisions of the walls of a room I have in mind the ordinary house, with rooms from 10 feet to 12 feet from floor to ceiling. The necessary skirting, if with about 6 inches of plain face, is generally sufficient if of good thickness, with a simple mould receding to the wall, thickness rather than height being required; this will keep the furniture away from the walls without considering what is called the chair-rail, which should in most cases be lower than the back of a chair—from 2 feet 6 inches to 2 feet 9 inches to the top of it. The space between these two is best of wood, the face of it projected somewhat from the face of the upper wall. The skirting, plain or panelled, face and rail, should either be of one colour or of harmonising colours of the same depth of tone; to cut it up into thin lines is a mistake. Above this the wall may be plain and uninterrupted up to the frieze-rail. This, with the frieze-rail and cornice about one seventh the height of the room, should all be designed together and kept to about the same tone of colour, of sufficient weight to look like a part of the wall. In designing these mouldings, mould the top of surfaces below the eye and the bottoms of those above the eye.

Another division as to height is to increase the frieze with rail and cornice to about one-fifth of the height of the room, giving the extra space to the frieze, and if the room is very low, sacrificing or squeezing the dado. In a drawing-room this plan will be found convenient, as pictures being generally small will not look well if skied, and the ornamental frieze furnishes and gives interest to the upper part of the wall. If there is height enough, the cornice mouldings can be moderated in size to form the starting of a hollow, connecting it with other mouldings to form the frame of the ceiling. The cove, so very general in the French work of the last century, is much out of fashion, but is undoubtedly serviceable in softening the connection between the decoration and walls and ceiling. If there is not height enough for a cove, the cornice kept down a few inches from the flat of the ceiling will give an opportunity of adding recessing mouldings and preventing the sagging appearance of an absolutely flat ceiling.

For bedrooms the deep frieze arrangement is very suitable, either with or without the dado, according to the height of the room.

It is a good plan, when arranging window-casings and architraves, to break the cornice out so as to form a boxing for the top of the curtains. The breaks have a good appearance, give good shadows falling on the curved surface of the curtains, and preventing the accumulation of dust.

Wall surfaces should be squared up; a narrow slip of paper over door or window architraves is best got rid of, also the long spandrel piece over an arch. It is better to break it forward with a vertical line and break the cornice over it. Soffits of arches should not be left plain as ceiling, but should be treated same as arched mould. These are points which cannot well be carried out unless done at the time of building. I have often had to ornament a ceiling where all the mouldings have had to be suspended from it, as it were, on account of the fixed position of the cornice. In low rooms the plan of treating the whole chimney-breast as a feature instead of applying the chimney-piece is a good one.

Dining-room.

The division of the wall space in this room might conveniently be by a wood skirting, plain face and rail, to a height of about 2 feet 9 inches (pictures could then, if of large size, occupy the space up to the frieze rail), the cornice, frieze and rail, grooved for picture hooks, being one composition. The heavy, Early Georgian type of cornice and dado appear to suit a dining-room. If it gets the morning sun the main filling of the walls might be a wall-paper two tones of deep green, the ground being warm in tone, with a lighter and colder print. The paint a golden green, and the flat of dado a deep, rich red, inclining to crimson; cornice and frieze tones of citrine, and the ceiling a still lighter tone. If the owner of the house has any oil-paintings they are likely to be hung in this room, and the question of the best background colour has to be considered; this may very well be studied in the public galleries which we have

access to, and that used in the entrance-hall of the National Gallery appears to me most satisfactory. It is a flock paper printed in two tones of a mellow, dark green, inclining to olive. It is there very pleasantly contrasted with dull red marble columns. Both the colour and texture contrast well with the oil-paintings, and give the very greatest value to them. There are other colours adopted, including red, which, I believe, is generally considered a good oil-picture background, but none appear to me so satisfactory as this. At South Kensington a dark, neutral green wall-paper of Morris's is very much used, but it appears to me too cold or grey for the purpose.

The question whether the cornice of a room should be treated dark or like the paint or light like the ceiling is always cropping up, and although it is rather trying to darken some nice plaster-work, which looks so fair in its natural white, I consider it should be treated with the walls, not necessarily so dark, but sufficiently so to prevent the sudden contrast from dark to light just below the cornice.

The Drawing-room.

The decoration of this room, of all others, should be bright and cheerful, and should light up well. Here light or white paint is in place. For this room the mistress of the house must be consulted and the various parts thought out with furniture, hangings and carpets to make the picture complete when furnished and occupied. Should the lady be a brunette, a cream paint and walls of a yellow tone may be suitable; if a blonde, a bluish grey or grey-green. The architectural panelling out of the walls of a room is but little practised now, although nothing gives such size and dignity to an apartment, whether by framing with large panels or by painted styles and rails. The tendency of late has been to ignore symmetry and to indulge in corners and recesses, and small windows in odd places, by which a certain picturesqueness is obtained, but unbecoming cross-lights are developed and a mere prettiness without dignity is the result. There is little fear of stiffness in a drawing-room, and when the furniture and upholstery come, the severe lines of an architectural treatment of the walls will be pleasantly contrasted.

Library.

In this room a quiet, restful tone of colour should be aimed at, bearing in mind that books are the best ornamentation of the room, and choosing colours which will give value to their bindings. The fittings should be of hardwood, and as it is inconvenient to reach books higher than about 7 feet 6 inches, this should regulate the height of them; a rail at this level (grooved for picture books) may be conveniently carried round the room where the bookcases do not occur. A fairly strong green is, in my opinion, the best to show off bindings, and this may cover the space above the bookcases with a deep vellum-coloured cornice and ceiling. The floor should be felted all over.

Bedrooms.

The deep-frieze treatment for these is generally most convenient, and the chief characteristic of the colouring should be freshness. Here white paint, which in sitting-rooms makes the furniture, hangings and carpets look dirty, is in place, and should be the standard of cleanliness and freshness generally in the room. The space above the picture-rail looks quite well in plain distemper, but may have a running frieze in colours with good effect, and in the ceiling I would plead for a little ornamentation to relieve the absolute blankness which is so very general.

I will not weary you by referring to other rooms without illustrations to refer to. Colour is too subtle and indefinite to talk about with advantage. Colour is relative; there is no such thing as a bad colour when regarded alone, as there may be a situation where that particular colour would be the best in combination with others for its position. A parti-coloured suit will keep fresh longer than a suit of one colour, and the same holds good in decoration. Contrasting colours enhance the value of one another, and it is quite possible by altering one colour in a decorated wall or ceiling to give freshness to the whole which before may have looked dirty and worn out. The coloured decoration of a room should be the conception of one mind, and the plan I advise is to make your scale sketch and stick to it as you would to your $\frac{1}{8}$ th scale drawings in a building. I am well aware that in practice this cannot always be carried out, and it comes to doing the best you can under the circumstances, and if your lady client has set her heart upon shrimp pink or hedge-sparrow-egg blue for her drawing-room, why, do the best you can to make a satisfactory combination in which those colours would predominate. What I should like to impress upon all who are not in the habit of doing so is that a constant study of colour brings great enjoyment with it. The critical faculty can be used everywhere. As you study old buildings to improve your sense of form and proportion, study natural objects for improving your colour sense. The most unlovely object if left alone will be covered by nature with the most beautiful colours, and the book is open for our delight.

The Chairman said that architects designed beautiful houses, but they had not always the opportunity of decorating them. When the decoration was undertaken, a scheme of colour should be arranged for the whole house. The great help to decorators was the electric light, which gave the same effect as natural light, except as regarded the shadowing; there was a sharpness to be got from the brilliancy, which had to be considered, however. The treatment of walls and decoration had been of late years overdone. He did not advocate a plain ceiling, but he thought to treat a ceiling and wall with raised decoration was overdoing it. When using a raised ceiling the wall should be plain and *vice versa*. As architects had often to deal with the decorating of old buildings, a knowledge of colours became important. They might have to treat a room or a house which had bad proportions, and very often by skilful colouring the bad proportions would be diminished.

Mr. Cole A. Adams proposed a vote of thanks, which was supported by Mr. W. Millard and Mr. Maurice Hulbert.

Mr. Shuffrey, in returning thanks, spoke in eulogistic terms of Mr. Walter J. Pearce's book on "Painting and Decorating." The author was a practical man, and his book was the best one on the subject.

It was announced that Mr. F. T. Baggallay would read a paper on January 14, entitled "Composition in regard to Public Buildings."

LISKEARD CHURCH TOWER.

AT the last monthly meeting of the Liskeard Town Council the Mayor read a letter from the vicar and another from the churchwardens, in reply to the report of the borough surveyor, which condemned the tower of the parish church as being unstable and dangerous to persons in its vicinity. The vicar wrote under date of the 13th inst. as follows:—

"In reply to your letter of November 11, I fully agree with the Town Council that immediate action should be taken to render the tower safe, and, for myself, will welcome and support the Council in every legitimate manner in the carrying out of their powers. That the tower is in a dangerous condition there can be no doubt. The reports of Mr. Prynne and of Mr. Sedding corroborate the fact that the tower is in a bad condition. I shall not hinder, but will support your Town Council in their removal of what is a menace to the lives of the people and the nave of the church."

The churchwardens wrote on the same date as follows:—

"Your letter of the 11th ult., addressed to the vicar, enclosing a copy of the report of the borough surveyor on the state of the tower, is receiving our anxious attention. The circumstances are, of course, well known to all. By the decision of the chancellor of the diocese, who held a court in Liskeard on September 23 last, we are at present prohibited from removing any portion of the structure. Under legal advice, we intend to again approach the chancellor, and trust to receive authority from him to remove all source of danger. The lord bishop has expressed his approval of the course we are pursuing."

The Mayor said the churchwardens wanted to pursue a legal course, seeing that they had no right, according to the decision of the chancellor of the diocese, to remove any portion of the structure. The vicar was willing to support the Town Council in every legitimate manner. In one sense both letters agreed.

Mr. Stantan inquired if, in the event of nothing being done by the churchwardens, the people of Liskeard were to continue to be in danger of the tower falling upon them. Was no one responsible?

The Mayor said he took it the vicar and churchwardens have the same end in view. The churchwardens trust to receive authority from the chancellor to remove all source of danger.

Mr. Henwood said there was a difference in the letters. The churchwardens still relied on the help of the chancellor and the bishop. The vicar, on the other hand, was willing to support the Town Council in anything they might wish to do. There was a very great difference between them. He thought the Council should thank the vicar for his kind letter.

Mr. Husband said the report of the borough surveyor on the condition of the tower pointed to the necessity of work being done which a private individual would be compelled to do. If the Council had power to deal with the matter their proper course was to proceed with the work forthwith.

Alderman Glubb: You mean to take down the tower?

Mr. Husband: Certainly.

Alderman Glubb: Then you don't make any distinction between a church tower and a barn? Some people do, you know.

The Town Clerk said there was a difference, as Mr. Glubb had pointed out, between the case of a barn and that of the tower of a church. At the same time, if the tower was in such a condition as to be a source of danger to life and limb—and he had been assured by an architect, apart from the report of

the borough surveyor, that it was a danger, and that portions of the masonry might come down at any time—it seemed to him that the Town Council had a duty to discharge in the matter. Then came the question, How could the Council deal with the tower of a church? He raised the question a month ago, pointing out that under one of the sections of the Towns Improvement Clauses Act, 1847, the word "passenger" was used. That raised a doubt in his mind as to whether or not anybody passing by the church tower might be a passenger within the meaning of the Act—whether it only applied to the highway. His attention had been drawn to a recent case under the Metropolitan Building Act, 1855, a similar Act that also used the word "passenger." It was an appeal to the High Court against the decision of the magistrates. Mr. Justice Cave said, and Mr. Justice Collins concurred, "In my judgment, these sections were intended to apply to all structures which were in a dangerous state," whether adjoining the highway or not. That seemed to give the Council power to deal with church towers. As to serving notice on the owners, who, he asked, were the owners of the church? There was no difficulty in serving a notice, because if the owner could not be found there was a special clause in the Act which gave them power to serve a notice by posting it up. Supposing the Town Council were to apply to the magistrates, in the first place, for an order to make the tower safe—to pull down such portions as necessary—the question arose, Who was to pay the costs? The Act provided that the owner should pay the costs. There was a case in which an ecclesiastical building was concerned, and it was decided that the vicar was not the owner of the fabric for that purpose, and that he was not liable to pay costs. That was their position as a Town Council. So far as he could see at present, it was their duty to remove such portions of the tower as were dangerous to life and limb. At the same time, there was no provision in the Act whereby, if they removed the tower, they could call upon any owner to pay the costs. There was a difference in that no rent was received as in ordinary cases.

Mr. Stantan: There are the pew-rents.

The Town Clerk: They don't go to the vicar.

Mr. Henwood proposed, "That as the vicar and churchwardens are doing their best to get over the difficulty, the Council allow the question to 'slide' for the present." Alderman Glubb seconded.

Mr. Young: At the same time, I think the public ought to be protected from the dangerous portions of the tower.

The Town Clerk: I take it the churchwardens will see that people are kept away from the dangerous portions.

The Mayor: I have every faith in the churchwardens, who are doing their work very well.

Alderman T. Lang: I think the best thing to do would be to fix a hoarding round the tower. As to deferring the matter, the same difficulties will confront you in the future as at present.

Mr. Young: Does the borough surveyor say the tower is dangerous as a whole?

The Town Clerk: The borough surveyor, after describing the defects, goes on to say that "these facts, coupled with the settlement above referred to, have seriously interfered with the stability of the structure—so much so that portions of the masonry may fall at any time."

The Mayor: He does not refer to any particular portion of the tower.

Mr. Lee: He says "portions may fall at any time."

The Mayor: Yes; that may be anywhere.

Mr. Lee thought, after such a strongly worded report from the borough surveyor, the proper course for the Council to pursue was to post notices round the tower pointing out that the fabric was in a very dangerous condition, and requesting people not to go near it. It was, in his opinion, a very serious matter. As members of the Council they were there to look after the interests of the public, and they ought to let everybody know the condition of the tower, so that they might avoid going near it. Mr. Lee put his suggestion in the form of a resolution, which was seconded by Mr. Husband.

Mr. Young said if the churchwardens put up a warning notice the public would laugh at them and not at the Town Council.

Mr. Henwood said the posting of a warning notice should be left to the vicar and churchwardens.

Mr. Lee thought the object of bringing the tower question before the Council was that they might have an opportunity of assisting the churchwardens out of the difficulty they were in. The tower was in a very dangerous state, and something should be done for the safety of the public either by pulling it down or rectifying it in some way. What was the object of deferring the matter when they all knew the dangerous conditions of the structure?

Mr. Husband: We have nothing at all to do with assisting the churchwardens. As a Town Council, it is our duty to protect the public. There is no reason why we should deal in a different way with the tower to what we do in the case of the property of a private individual. The borough surveyor reports

that the tower is in a dangerous state, and we are bound to take notice of what he says.

Alderman Glubb pointed out there was no conflict between the resolutions of Messrs. Henwood and Lee, and both were then carried.

EDINBURGH ARCHITECTURAL ASSOCIATION.

A MEETING of the Edinburgh Architectural Association was held on the 15th inst. in the Royal Institution, Princes Street—Mr. Thomas Ross, the president, in the chair—at which Mr. Leslie Ower, president of the Dundee Institute of Architecture, read a paper on "The Evolution of Style in Architecture." There were, he stated, many influences at work in the development of the styles, such as climate, materials, habits of the people, political disturbance, and so on; and in modern days they had such influences as new materials, scientific inventions, facilities for travel and transport, and the like. One of the baneful influences of our commercial and city life on architecture was smoke. It was not encouraging, to say the least of it, to see a fine piece of architecture become in a year or two, sometimes almost before it was completed, so soot-begrimed that it lost much of its effect. Surely engineers and scientists were not yet prepared to admit that everything had been tried, and that the cure of this great evil was beyond them. The thought had been expressed by many, Why was there no new style of architecture invented? And they lamented the inartistic spirit of our time, which seemed to them to fall behind past ages in this respect. These people forgot that no architectural style had ever been invented, but had been the slow growth of centuries, and a little reflection would show that it was not to be expected even in an age like ours, unsurpassed for progress in science and invention, that either new materials or inventions would quickly work such a radical change in building design and construction as to create anything that could be called by the honoured name of a style. The world moved slowly in such matters, and it might even be that, all unknown to ourselves, as it had always been to those who were the busy agents in producing it, a style might be developing under our hands and eyes which, in the estimation of following generations, would be fit to take rank alongside the great architectural styles of the world. The lecture was illustrated by lantern views of ancient and modern buildings.

GLASGOW ARCHÆOLOGICAL SOCIETY.

A MEETING of the members of Glasgow Archæological Society was held on the 16th inst., Mr. John Honeyman presiding. Mr. T. L. Watson read a paper on "The Vaulting of the Lower Church of Glasgow Cathedral." He said that the purpose of his paper was to show that the design of the lower church was not of one period but of several. The middle compartment was later than the aisles, and there was evidence that this part of the work was delayed in order to facilitate the completion of the cathedral. When it came to be carried out as the cathedral approached completion, the original design was abandoned or modified, or a new plan adopted. The evidence of these facts was to be found in the mouldings, which indicated a considerable advance in the style of architecture. It was also to be found in the general design followed, which was decidedly later than that of the aisles, and the last evidence of it was in the springer stones of the vaulting, where it could be distinctly seen that the old plan was abandoned, and a new design engrafted on old pillars. The respective dates of the period of construction were:—South-west compartment, 1190-1225; lower aisles, 1230-40; upper aisles, 1240-50; middle compartment, 1256-60; and the vaulting over the stairs, east end, 1260-1300.

THE NATIONAL PORTRAIT GALLERY.

THE following portraits have recently been acquired by the Trustees of the National Portrait Gallery:—

By bequest—

A large family group of Adam Walker (1731-1821), natural and experimental philosopher, with his wife, his daughter, afterwards Mrs. Gibson, and his three sons—William and Deane F. Walker, lecturers on experimental philosophy, and Adam Walker, afterwards Prebendary of Hereford; painted by his friend, George Romney. Bequeathed by the late Miss Ellen Elizabeth Gibson, of Durham, granddaughter of Adam Walker.

By presentation—

Sir George Hayter (1792-1871); a sheet of sketches by himself, representing himself in the act of painting the large picture of the House of Commons in 1833, now in the National Portrait Gallery. Presented by Major Harrel.

Mungo Park (1771-1806), the African traveller and explorer of the river Niger; a miniature painting after H. Edridge, A.R.A. Presented by Mr. Lawrence W. Adamson.

By purchase—

Thomas Gainsborough, R.A. (1727-88); a drawing by F. Bartolozzi, R.A., taken from the original portrait of Gainsborough by himself for the purpose of engraving.

Jane Porter (1776-1850) and Anna Maria Porter (1780-1832), novelists; companion drawings by G. H. Harlow, which were engraved for Jerdan's "National Portrait Gallery," vol. v.

Tobias George Smollett, M.D. (1721-71), the eminent novelist; painted at Pisa, probably by an Italian artist, and formerly in the novelist's own possession at Leghorn.

General James Wolfe (1726-59); a full-face portrait seen to the knees, in the uniform of the Marines; painter uncertain.

A full-length portrait of Henry, Prince of Wales (1594-1612), painted by Paul Van Somer, and formerly at Blenheim Palace, has been purchased from a fund presented by the committee of the Stuart Exhibition in 1890.

TEWKESBURY ABBEY.

THE following appeal has been issued by the Archdeacons of Gloucester and Bristol and the vicar of the parish in behalf of the restoration fund of Tewkesbury Abbey:—"It is not too much to say that Tewkesbury Abbey is the noblest parish church in England. Larger than many cathedrals, second to none for its historic associations, enriched with architectural features of matchless interest, with its massive Norman nave and tower and graceful Decorated choir and ambulatory, this famous abbey is one of the few survivals of the great destruction which followed the dissolution of the monasteries in the sixteenth century. The inhabitants of Tewkesbury—then as now a small country town of 5,000 people—saved their church, which with its monastic buildings was actually scheduled for destruction, by a large money payment to Henry VIII. For three centuries great efforts have repeatedly been made by them to preserve it from decay. Seventeen years ago the restoration of the interior was completed at a cost of more than 11,000*l.*, the work having been carried out under the supervision of the late Sir Gilbert Scott and his son, Mr. J. Oldrid Scott, the present architect of the building. This admirable restoration was accomplished by the untiring efforts of the then vicars, Canon Davies and Archdeacon Robeson, generously supported by good laymen too numerous to mention, and many valuable gifts have since been added. But the exterior was scarcely touched for want of funds, and the time has now arrived when extensive external repairs to roofs and walls are absolutely necessary. For the maintenance of this magnificent and once wealthy abbey there remains an endowment of not 20*l.* per annum. The benefice is of a net value of less than 200*l.* per annum. The weekly offerings of the congregation and the casual fees paid by visitors are not sufficient to provide for the ordinary church expenses, such as warming, lighting, organ and hydraulic apparatus, choir and vergers, together with the constant small repairs and replacements needed in so large a building. Feeling, therefore, the immense importance of preserving for future generations their noble church, the abbey restoration committee have resolved once more to appeal to the generosity of churchmen at large to aid them in completing the restoration of the whole building, and providing effectually for its future substantial maintenance and care. For this a sum of 10,000*l.* is needed, to be thus employed:—(1) 7,000*l.*, of which from 2,000*l.* to 3,000*l.* will have to be immediately expended in repairing and in many places renewing the roofs of nave and transepts, that of the north transept, immediately over the great organ, being now in a very deplorable condition, and in arresting the decay rapidly going on in the stonework of the walls; the remainder to be invested so as to provide a permanent fabric fund, by means of which the whole building may be constantly attended to. (2) 3,000*l.* to be invested in order to efficiently maintain the spiritual work and services of the Church. The committee are confident that the generous instincts of English churchmen will not allow this great national monument longer to remain in its present precarious position. Donations, to be spread over three years if desired, which may be devoted to either of the objects stated, will be gratefully acknowledged by the hon. treasurers, the Archdeacon of Gloucester, College Green, Gloucester, and Mr. Alfred Baker, the Old Bank, Tewkesbury."

EDINBURGH ARCHITECTURAL SOCIETY.

AT the fifteenth meeting of the session held on the 15th inst.—Mr. A. R. Scott, ex-president, in the chair—Mr. T. Kershaw Bonnar read a paper entitled "Mosaics," in which he first treated of the art from an historical point of view, tracing it from its earliest time in Egypt down to the present day, and then described the several methods, ancient and modern, of carrying out the work.

TESSERÆ.

The Roman Campagna of Antiquity.

THE temples that ancient Rome raised to Fever and Mephitæ were memorials of the victory of the plough over an enemy terrible still in his overthrow. It is probable that the marsh fever, quite as much as the hostile tribes around, worked towards the clinching of the Latin confederacy. Whenever discord among the small communities of Latium caused the implements of agriculture to rest the malaria raised its head. A disused drain in which under the burning sun weeds rotted in stagnant water, mixed with the mire of the volcanic soil, carried fever and death into the nearest houses. Thus neighbourly friendship found its mightiest advocate in the fever, which well deserved a temple by the side of that of peace. To the patron of neighbourly friendship, Jupiter, the Latins built a shrine on the highest summit of the Alban chain, on the brow of the extinct fire mountain Monte Cavo. Once a year from all the villages of Latium a procession in holiday garb moved along the sacred way up to this spot, to celebrate the feast of the confederacy and sacrifice to Jupiter; and delegates from them all assembled in the beautiful valley adorned with evergreen oaks down by Marino, to settle by the Ferentine spring their disputes and take council together touching their common affairs. A hundred years ago venerable remains of the very ancient temple of the confederacy were yet standing. In the year 1783 they were torn down by the last Stewart, cardinal bishop of Frascati, who out of the fragments built a Passionist convent. With this achievement did that royal race go into its grave.

Primitive Irish Churches.

Although the primitive churches of Ireland have little in them to interest the mind or attract regard as works of art, yet in their symmetrical simplicity—their dimly-lighted nave entered by its central west doorway, and terminated on the other side by its chancel-arch, affording to the devout worshipper an unimpeded view of that brighter sanctuary in which were celebrated the divine mysteries which afforded him consolation in this life and hope in the next—in the total absence of every thing which could distract his attention—there is an expression of fitness to their purpose, too often wanting in modern temples of the highest pretensions; as the artless strains sung to the Creator, which we may believe were daily hymned in these unadorned temples, were calculated, from their very simplicity and artlessness to awaken feelings of deep devotion which the gorgeous artificial music of the modern cathedral but too rarely excites, even in minds most predisposed to feel its influences and appreciate its refinement. In short, these ancient temples are just such humble, unadorned structures as we might expect them to have been; but, even if they were found to exhibit less of that expression of congruity and fitness, and more of that humbleness so characteristic of a religion not made for the rich, but for the poor and lowly, that mind is but little to be envied which could look with apathy on the remains of national structures so venerable for their antiquity, and so interesting as being raised in honour of the Creator, in the simplest, if not the purest ages of Christianity. That the unadorned simplicity and contracted dimensions of the earliest Irish churches were not at least altogether the result of poverty and ignorance of the arts in their founders appears to be extremely probable. Poor those honoured individuals unquestionably were, but that poverty generally, if not in all instances, appears to have been voluntary, as became men who obtained their simple food by the labour of their hands; but that they were ignorant of the arts, or insensible to their influence, could scarcely have been possible in men very many of whom—Romans, Gauls and Britons—were educated where those arts, though they had become debased, were still cultivated; and we have not only abundant historical evidence to show that many of the ecclesiastics in those early times obtained celebrity as artificers and makers of the sacred implements necessary for the church, and as illuminators of books, but we have also still remaining the most indisputable evidences of their skill in those arts, in ancient croziers, bells, shrines, &c., and in MSS. not inferior in splendour to any extant in Europe.

French Pulpits.

In France none of the ancient churches have, as far as we know, preserved any pulpits of an earlier date than the fifteenth century. It was customary from the commencement of the twelfth century in our northern churches to arrange a rood-loft at the entrance of the choir, from the top of which the epistle and gospel were read, and exhortations addressed to the faithful when occasion served. In every case these sermons, before the institution of preaching friars, only took place occasionally. It is probable that in particular cases sermons were preached from a movable pulpit, arranged in some part of the church for that occasion. The pulpit was then only a little wooden stage, closed on three sides and covered in front with a hanging. But in the thirteenth century, when the preaching orders had been

established to combat heresy and to explain to the people the truths of Christianity, preaching became a necessity which the architectural arrangements of religious edifices were compelled to obey. Exactly to fulfil these conditions the Dominicans and the Jacobins, amongst others, built churches with two naves, one being reserved for the monks and divine service and the other for preaching; then the pulpits became fixed and entered into the construction. They formed, as it were, a balcony projecting into the interior of the church, carried on corbelling, accompanied by a niche taken out of the wall, and generally lit by little windows. Access was gained by a little staircase contrived in the thickness of the wall.

Expression in Architecture.

All objects that enter into the composition of a piece of architecture have some particular character which seems especially to belong to them and which it behoves us to pursue. However we may vary the treatment of them, however much we may overlay them with ornament, we should be careful to do nothing calculated either to disguise or conceal their special character. Their motive and rational principle should be apparent and unimpeached, and honesty and good taste alike demand that in the treatment of their details we should seek rather to display their purpose than to conceal it. Thus, a column is a vertical support, and in designing a column its fitness as such should never for a moment be forgotten. Yet there is nothing perhaps which exhibits the waywardness of art more than the column. Its purpose is simple and obvious; its duty is as apparent as it is possible for any architectural feature to be, and yet it would seem that architectural ingenuity has been racked and tormented to devise modes of departure from that simple type which its mechanical duty seems to render so obvious. The Hindoo builder rests his weights upon fanciful and extraordinary compositions of animal and vegetable life. A similar barbarity was prevalent in Italy in the early Mediæval period, when we see the shafts of columns poised most inconveniently upon the backs of monstrous animals. But without dwelling on preposterous excesses of this nature, which are the natural results of a bold but uncultivated fancy, propriety has been defied in a great variety of ways and at perhaps all periods and ages of art.

GENERAL.

A Meeting of the Council of the Architects' Benevolent Society was held in the rooms of the Royal Institute of British Architects on Monday, under the presidency of Professor Aitchison, A.R.A. There were seventeen applications for assistance, and out of this number relief was afforded to fourteen, 21s. being distributed. During the meeting the honorary treasurer (Mr. W. Hilton Nash) reported that many subscriptions due on January 1 of the current year had not yet been received.

General Billot, the French Minister of War, has prepared a Bill for the demolition of the northern and western portion of the fortifications of Paris, between Pantin and Point du Jour. The estimated value of the building sites thus provided is 700,000,000 francs.

Mr. S. L. Rymer, chairman of the Court of Governors, announces that the Whitgift Hospital, Croydon, is not in danger of demolition, as no proposal of the kind has been brought forward.

The Queen has appointed a new Historical Manuscripts Commission, consisting of the following members:—Sir Nathaniel Lindley, Master of the Rolls (chairman), the Marquis of Lothian, the Marquis of Salisbury, the Marquis of Ripon, the Earl of Crawford, the Earl of Rosebery, Viscount Esher, Lord Edmond Fitzmaurice, the Bishop of Oxford, Lord Acton, Lord Carlingford, Sir Edward Fry, Mr. Lecky, M.P., Sir H. C. Maxwell Lyte and Dr. S. R. Gardiner. Mr. J. J. Cartwright, of the Public Record Office, is reappointed secretary.

Mr. Ernest Normand has presented to the Scarborough Corporation on behalf of his wife, so well known as Henrietta Rae, a three-quarter life-size portrait in oils of Mr. George Lord Beecroft, an ex-mayor of Scarborough and the founder of the Doré Gallery in London.

The Asylums Committee of the West Riding County Council are making arrangements for the erection of an additional asylum for about 2,000 patients.

The Liverpool Corporation have agreed to pay 1,500*l.* and costs for interference with ancient lights by the erection of the museum extension and technical schools at the corner of William Brown Street and Byrom Street.

The Exhibition Committee of the Fanmakers' Company in their report state that while the exhibition was not a pecuniary success, they have the satisfaction of knowing that the company has given a fresh impetus to the fan trade. Over 480 exhibits were submitted to the judges, and all the fans, with the exception of one, were returned to their owners. The missing fan was, the committee have every reason to believe, stolen, but its value was returned by the insurance company.

The Architect.

THE WEEK.

WHENEVER there is an inquiry into Government Offices it is usual to call attention to the waste of space in the Home Office and the Foreign Office. The rooms on the principal storey are too high. The explanation given by Mr. J. O. SCOTT to the committee on Government Offices was that the height entirely arose from the original instructions issued when the buildings were competed for. They were to the effect that it was necessary to have a great suite of reception-rooms in connection with the Foreign Office, and that was allowed to regulate the height for the whole of the rest of the building. Architecturally it was considered that the point was settled by the height that was given to the Foreign Office, and that height was carried through the whole block. The Government authorities of the time are therefore responsible for the loss of space, but we suppose the blame will continue to be cast on the late Sir GILBERT SCOTT.

THE fire in Melbourne, which broke out two days after the fire in Cripplegate, would appear to have been extended mainly by the aid offered to the flames by flimsy construction. The chief officer of the Melbourne Fire Brigade in his report says:—"In my opinion the cause of the rapid spread of the fire was the construction of the buildings. They could scarcely be better constructed for the spread of fire, put up as they are without a fire-break wall. Only very narrow right-of-ways run down to the rears, and it is almost impossible to get appliances to work effectually in these. Windows, unprotected by iron shutters or fireproof apparatus of any kind, overlook these right-of-ways from adjoining buildings, and afford the best possible means for a fire to get from one place to another. The right-of-ways, too, act as immense flues, through which the flames are continually fanned. The falling walls and roofs so completely blocked up the right-of-ways that work in them was most dangerous. Several firemen had most narrow escapes from being crushed to death in this way. The Mutual Store was saved simply because, being a modern building, it was constructed as far as possible on fireproof principles. The rooms are made so that little or no draught can take place from the main buildings through the stairways and lift-channels. The windows on the outer walls are for the most part shuttered with iron gauzework, on the principle of the Davy safety lamp. These answered exceedingly well in preventing the flames making their way through the windows into the building. There are several weak points in the building, however, and these the fire found out. The fact that the Mutual Store, surrounded as it was for hours by the fiercest flames, was saved, proves to my mind that if the other warehouses in this block had been constructed on similar lines we should have been able to extinguish the fire before it had done one-tenth of the damage." The use of wire gauze shutters is a point worth the attention of architects.

AN interesting "find" was exhibited by Mr. MANNING at the last meeting of the Oxford Architectural Society. In last March a labourer in digging for gravel on Standlake Down, eastward of the well-known British cemetery, found at the depth of about 3 feet a skeleton, lying at full length, with the head to the east. The articles deposited with it were:—(1) A saucer-shaped fibula of bronze, 2 $\frac{3}{4}$ inches diameter, ornamented with an incised cross and some S-shaped designs; two concentric circles at the intersection of the cross-arms, and at the back attachment for a pin. (2) A bronze disc fibula, 1 $\frac{3}{4}$ inch diameter, with ornamentation done by puncturing. (3) A flat bronze ring fibula, 1 $\frac{1}{2}$ inch diameter, having arrangements as if for a pin. (4) A bone ring, 2 $\frac{1}{8}$ inches diameter, in four places ornamented with four dots, arranged as a lozenge. (5) A bronze needle, 3 $\frac{3}{4}$ inches long, the part for the eye flattened out, and round the eye a line of shallow notches, forming a chevron ornament. (6 and 7) A bronze pin and needle. (8) A necklace of fifteen amber beads and four of coloured clays, some in patterns of blue, red, yellow and white.

(9) An iron spearhead, with socket; a long narrow blade, socket open; length, 11 inches. (10) An iron knife-blade, with thick back and one cutting edge; pointed tang, part lost; present length 5 $\frac{1}{4}$ inches, width $\frac{3}{8}$ inch. (11) A second knife-blade, imperfect at each end; length 4 inches, width $\frac{3}{4}$ inch. The articles proved that the Ancient Britons were not always indifferent to the adornment of their bodies.

WE lately noticed some of the defects of Roslyn Chapel, which is the most over-ornamented Gothic building in all Britain. The severest criticism on it is that by the late Lady EASTLAKE, an authoress who wrote much concerning Mediæval work. In her "Journals and Correspondence" is the following passage:—"We proceeded to the chapel—that luscious conglomeration, that inlaid cabinet of all the imaginable sweets of architecture, that *pot-pourri*, that *biscuit* work of a composition, which has been lauded as something beyond all praise, but which had it been built by NASH in the nineteenth century would have been abused as it deserves. One is equally taken by surprise at the beauty of the workmanship and the vileness of the taste. All styles, all ages are petrified here into perpetual disagreement: the Grecian ceiling bent into the Gothic arch, the Gothic arch laden with Grecian entablature, ornamented everywhere *ad nauseam*, and not enough of any one kind to show its real effect; an exquisite niche with most elaborate tracery of canopy and pedestal carried out into a set of starfish rosettes, which perform—what such ornament never did before—a Gothic arch round a squat, thick-set window; and bring your eye again, before you can recover your temper, to another little niche of Christian perfection, which, like its fellow, met the overlaid framework of the window. Below are the gorgons of a Popish legend, above the bells of a Chinese pagoda, buttresses and pinnacles in juxtaposition, which are countries and centuries apart in art and history, a very fancy ball of architecture. Within there is more to please and more to lament, a greater beauty of form and greater perversion. If you stand in the nave and do not lift your eyes above mid-height of the pillars, nothing can well exceed the beauty both of the forms and proportions, but if you look higher or step aside, you are puzzled with huge tusks of open tracery, which point and stare at you, or worried with garlands of flowers bent into the angles of a Grecian border and bisecting the tiny Mediæval shaft, or excoriated with clumsy leaves of decorated stone which hang above your head, and cut the arches of the side aisles into a succession of heavy steps." The criticism is the more remarkable as coming from a lady, for, as a rule, the work has a fascination for the fair sex which is irresistible.

M. BOUVARD, who holds the position of the late M. ALPHAND as director of the Paris municipal works, has received a present which he must value highly. All the officials connected with the various departments under him have subscribed for a memorial of their gratification on his promotion to the rank of commander in the Legion of Honour. The gift consists of a reproduction in silver and ivory of COUTANT's statue *Armed Peace*. A similar copy was presented to the Russian marines in 1893 by the Municipal Council. The relations between M. BOUVARD and his large staff are watched with interest by the people of Paris, for Paris suffers if there is any sign of disloyalty.

ONE of the oldest of French railway engineers of the first class has passed away. CHARLES EMILE-LOUIS-THOUIN was born in Douai in 1819. He studied in the college of that city, and then passed to the Central School of Arts and Manufactures in Paris. From it he obtained his diploma as a civil engineer. In 1843 he entered the Government service, and was first employed on the railway between Lille and the Belgian frontier. He afterwards received an appointment from the Northern Railway Company, and rose by degrees to the post of engineer-in-chief. M. THOUIN rendered many services to the French army in 1870-71. His name will be associated with those of PELLET, MATHIAS, SAUVAGE, FRANCHAT and POLONCEAU as contributing to the efficiency of the French railway system.

THE EVE OF THE RENAISSANCE.

ONE of the peculiarities of the Sketch Book of WILARS DE HONCOURT is the number of novel forms which were introduced as practicable in building. To the Picard architect stone seemed to be an almost plastic material which could be adapted to represent bizarre designs. Unlike his predecessors, WILARS was not satisfied with France as a region which afforded objects for study or commissions in which he could display his versatility. He not only gives sketches which are evidence that he visited several of the great churches of France, but, as he tells us, he resided in Hungary, and saw there such a piece of mosaic pavement as he represented. The church of St. Elizabeth, in Kaschau, has so much resemblance to the church of St. Stephen, in Meaux, there seems to be little doubt that when WILARS was summoned to Hungary it was for the purpose of designing a church in the French style. While in that country he seems to have had his eyes opened to a new world of wonders. He drew strange animals, among them some lions, the tomb of a Sarrazin, examples of Byzantine art and other novelties for a Frenchman.

WILARS'S Sketch Book is generally esteemed as a unique curiosity, but it has a higher value. It is evidence of the beginning of a new era in architecture. The schemes of construction suggest the draughtsman who considered that anything which appears feasible on paper, can be realised in stone. Geometry was supreme, and gravitation was to succumb to it. The more difficult the task of execution appeared to the mason, the more credit redounded to the designer. In France and Germany, as a consequence, extravagance was allowed the fullest license, and the sobriety of an earlier time was rejected as commonplace.

WILARS also appears as a personality, and in that way he is an indication of the coming Renaissance. One of the differences between the artists of the two periods is that the Goths accepted oblivion as inevitable, while the Renaissance men endeavoured to make their work a memorial which could not be confounded. In his book on "Church Principles considered in their Results," published in 1840, Mr. GLADSTONE wrote:—"It has been observed as a circumstance full of meaning that no man knows the names of the architects of our cathedrals. They left no record of their names upon the fabrics, as if they would have nothing there that could suggest any other idea than the glory of GOD, to whom the edifices were devoted for perpetual and solemn worship; nothing to mingle a meaner association with the profound sense of His presence, or as if, in the joy of having built Him an house, there was no want left unfulfilled, no room for the question whether it is good for a man to live in posthumous renown." The investigations of records which have been carried on during the past sixty years have not furnished information which would make it necessary for Mr. GLADSTONE, if he were reprinting his book, to modify the above passage. Similar darkness prevails in all countries where buildings were raised in Mediæval times, and in consequence the history of architecture becomes a narration of effects for which no causes are apparent. A few names like WILLIAM of Sens, WILLIAM the Englishman and ERWIN of Steinbach have survived, but they only, as it were, increase the gloom which has overspread the lives of other architects. It is not too far fetched to suppose that the antipathy to Gothic works which was exhibited by VASARI arose in a great measure from his aversion to find hundreds of artists passing away and leaving no more record of their existence on the earth than if they were so many weeds. To him the least small-beer chronicle, when it related to a painter or a sculptor, was interesting, and as an architect he saw no reason why men who were abler in construction than himself should be deprived of their fame. He could not understand a system where individuals were ignored or bore only numbers to distinguish them. From the early days of the Renaissance an opposite system prevailed, and VASARI was able to find in small towns and villages throughout Italy information about the lives of men who, although artists, were not always renowned for masterpieces. VASARI'S occupation would have gone if the Mediæval indifference to fame prevailed in Renaissance times. Accordingly, whenever he has an opportunity to refer to the architecture which was the controlling art among the

Goths, he gratifies himself by describing it as the art of barbarians and the buildings as bringing shame to the builders. VASARI did not remember that when Gothic was purest there was a common impulse among builders and congregations, and it was supposed that the people who contributed stones or carted materials would have as good right to fame as those who directed the operations. When the figures of bullocks were introduced in the towers of Laon a sort of sermon was preached against the vanity of seeking after a posthumous reputation.

WILARS DE HONCOURT was not so well-disciplined in self-renunciation. In his desire to leave a record of what he saw, he was a forerunner of the Renaissance artists. Secular patronage began to rival that of the Church, and a prince who lived surrounded by minstrels and rhymers was likely to take a different view of the future to what was always present to the monks. The Italian tyrants, to whom human life was of little account, were ambitious to resemble ancient Romans and to have their deeds recorded for the benefit of future generations. They had no objection to the artists who adorned their courts appearing for ever as a sort of attendants on them. When CHARLES V. ascended the French throne in 1364 a new era commenced for the arts. According to the "Songe du Vergier," every day a book had to be read to him, and he possessed no less than 900. While dealing with his time as became a sage, he used to dream of the past and of the future. The buildings which he erected have not the delicacy of those of the next century, but they suggest efforts to depart from the monastic type. At the Court of CHARLES the artist was prized, and it was only reasonable that a system should be admired which recognised that he was not made for a hermit. Is it any wonder painters, sculptors and architects endeavoured to advance a movement which led to their own glorification? VASARI tells us he was moved to indignation at the thought that some men's reputation might be concealed, and accordingly he wrote his "Lives," and the work was an extraordinary success. A Mediæval artist would not be able to understand the need for such a duty or the advantages which the souls of the artists would derive from the publication of accounts of their everyday work. There is much to be said for that theory, but it was one of the factors which promoted the Renaissance, for it no longer appeared to harmonise with the conditions of human nature. If Italy is more closely associated with the movement than any other country, it is in a large measure owing to the existence of enthusiasts in every town and village, who claimed a sort of property in artists and were ready to do all they could to assert the superiority of their townsmen over the artists of other places.

Gothic buildings were not favourable to that end. They were rarely constructed by the people of one generation, and their design and adornment were the work of several men. It would be unjust to give preference to a few. Then there were no spaces in which a painter could revel, and the sculptured figures seemed to be only elements in a system that was imposed by the clergy. Consequently architects were driven to attempt extraordinary feats in construction which would keep their names from forgetfulness, and sculptors endeavoured to make their work too emphatic. The Sketch Book of WILARS DE HONCOURT is therefore a sign of the times, a memorial of a craving which was not in keeping with the spirit which inspired the erection of Mediæval buildings.

MODERN ARCHITECTURE.*

THE new volume by Mr. STATHAM had its origin in a course of lectures given to the Association's Class of Design. Modern architecture is a subject more difficult to treat than is ancient architecture, for it demands frank criticism, which is not always acceptable. The selection of examples also gives rise to suspicion of partiality. It must be allowed that Mr. STATHAM has shown much tact in his treatment, and although there may be differences of opinion about his judgments, his honesty cannot be doubted.

* *Modern Architecture.* A Book for Architects and the Public By H. Heathcote Statham. London: Chapman & Hall, Limited.

To discuss modern architecture needs an exposition of principles, and after the failure of FERGUSON'S efforts to explain how designs were produced and could be improved, few men will care to assume the rôle of a law-giver. But it is well for students to know there are principles and that they are now being utilised. Some of the members of the Class of Design must, from what they see performed in their masters' offices, believe routine is omnipotent in architecture, and a very profitable practice is to be produced by the adaptation of drawings which have already served for a variety of buildings. It is an advantage for them to learn that, although there may be no abundance forthcoming of novel forms to reward the earnest designer, there is enough visible in England to prove the existence of discontent with stereotyped versions of styles, a feeling which is probably the most hopeful sign of the times. Modern buildings have not the fidelity to ancient details which used to be a *sine qua non* of "purity," but the departure from established forms, it must be acknowledged, involves far more thought and labour than are needed for exact reproduction. A book like Mr. STATHAM'S, which brings progressive work into prominence, is able to counteract the trading influence which is exercised over pupils in many offices.

The book is also addressed to the public. To them its guidance will be less certain. It is easy for a pupil after a few weeks in an office to discriminate between art and pelf, but how is an outsider to know that the unguarded expressions of some of the "artists" recorded in the pages do not express the convictions of a whole class? Suppose a plain man is desirous to build, and reads that the true artistic method of carrying out architectural work is to have no fixed plan and no contracts, and that drains and ventilation do not come within an artist's purview, will he not be disposed to seek out the representative of routine who will be able, if necessary, to get from his surveyor a bill of quantities before drawings are prepared and a provisional agreement from a builder? In one case he has to leap in the dark, in the other he is always on sure ground, and it is not difficult to imagine which course he will follow. Affectation of superiority is an old weakness of artists, but when it takes the form of incapacity to meddle with business or builders' extras it is merely increasing the power of the common practitioner. Mr. STATHAM therefore says:—"The modern architect will be wiser not to plume himself on being exclusively an 'artist' in the usual sense of the word. If he assumes that position and acts on that principle, he must inevitably neglect a portion of the work for which his services are demanded; he can only be 'the incomplete architect,' and the modern world requires the complete architect." The following passage shows that the artistic gift in its loftiness will not condescend to glance at ordinary requirements for comfort in dwelling-houses:—

In the plan in fig. 105 it may be noted that both the dining-room and drawing-room fireplaces are too close to the door for real comfort in gathering round the fireplace. This is a patent defect (or one would think ought to be) which is extraordinarily common in modern house-planning, and is more especially so among the school of architects who rather pride themselves on looking at house architecture from a specially artistic point of view. Plan after plan by these gentlemen I have come across in which there did not seem to have been any consideration given to such minor matters as the position of the fireplace in reference to the door, or even the way the door ought to open. Yet these things make all the difference in the comfort of a room. Fig. 106 is a plan typical of this class of defects. The dining-room door opens nearly on to the fireplace, and both this and the other door, from the kitchen region, are hung the wrong way, so as to expose the room fully from the outside when opened. They ought, of course, to be hung on the side of the doorway furthest from the wall, and open on to the wall, otherwise the privacy and comfort of a room are interfered with every time the door is opened. This is the kind of thing that even the speculating builder has his eyes open to, yet there are eminent architects who seem entirely blind to it. In the plan referred to it will be seen that when the dining-room door is wide open, anyone standing at the entrance door would see right to the back of the room. In the library the fireplace, though too near the door, is behind it as it opens, which is better. The kitchen window is placed so that the cook at the kitchen range must be in her own light, and it looks nearly west, which will be pleasant for the cook when dishing up dinner on summer evenings with the sunset pouring directly in.

All these little points as to the way a room will actually "work" in occupation ought to be present to the mind's eye of the architect in planning the rooms; but it is evident they often are not.

"Domestic Architecture," from which the extract is taken, is only one chapter in the book. Mr. STATHAM criticises in a like spirit "Church Architecture," "State and Municipal Architecture" and "Street Architecture." In each section he introduces French, German and American examples for the sake of contrast, and in most cases the foreign work is not superior. Frenchmen will be amazed when they are told that their architects are mostly very bad planners; "their houses rather convey the idea that to their minds any plan will do, so long as the requisite number of rooms are there and the architectural treatment satisfactory from their point of view."

In church work many experiments are illustrated. The late J. D. SEDDING was pleased to step over the boundary between Gothic and Renaissance whenever the chance was offered. He allowed himself to do stranger things when he became the tool of those who were desirous of obtaining worshippers under false pretences, such as ignorant Italians of the organ-grinding class, and erected the church on the site of the Huntingdon Chapel in Clerkenwell, which is supposed to be a Romanist building. His eclecticism in Sloane Street is admitted by Mr. STATHAM to have been carried too far. The pulpit "has the appearance of being an exotic work presented by some wealthy donor who had purchased it in Italy, and allowed to find room in the church out of complaisance to his generosity and good intentions. No one would suspect that it was, in fact, designed for the position." When so much inconsistency is exhibited by men who can claim to be leaders, what can be expected from the rank and file of the architectural army? While novelties are appearing, towers with high steeples are going out of fashion, and the change is significant of the new ideas about churches and their uses. Mr. STATHAM seeks a middle course in dealing with them. He would sometimes abandon high towers and spires in towns, but would retain them in the country, where they serve as landmarks and where bells are not distracting.

The towers of municipal buildings are supplanting church towers, although effective groups can be produced, as in Bath and Oxford, in which that feature is not emphatic. The *raison d'être* for a lofty tower is not always manifest. It seems a waste of ingenuity and money to construct one to serve as a clock case, such as we see at Westminster. The Victoria Tower is supposed to be a storehouse of Parliamentary papers, and on that account is excusable; but so much utility cannot be claimed for many structures of the same class. As a consequence a tower is with difficulty worked into the plan, and there is much to be said for those who propose to keep it detached, as if it were for ornament instead of use. In speaking of the tower of the Sheffield Municipal Buildings, Mr. STATHAM says:—

The angle position of the tower would be justified by the site if it were carried down to the ground, and if it marked a cardinal point on the plan. Unfortunately, it marks nothing but a strong-room on the ground floor, and a serving-room to the mayor's apartments on the first floor; and the descent of the lines of the tower to the ground is marked by the two small pieces of building which cling to it, one containing a serving store, the other latrines. This is perhaps hardly the way to render a tower a true architectural element in such a building, or to answer the criticisms of the French as to our introduction of "useless towers" in our town halls and other structures.

Mr. STATHAM'S volume should excite thought among architectural students, and that will be a boon. There is variety enough in the descriptions and illustrations to make them fairly representative of modern building, and of the efforts which are being made to arrive at an originality which will endure.

The French Minister of Public Instruction has suspended until February 1 the courses, competitions, &c., of the section of architecture of the Ecole des Beaux-Arts, in consequence of "grave disorders" being produced in the course on the theory of architecture.

ELECTRIC LIFTS.

THE subject of the type of lift to be adopted is often a troublesome one to the architect when his building is nearing completion.

Hydraulic power is that most frequently adopted, and for short distances no doubt the old direct-acting type of ram lift is hard to beat, although uneconomical on account of the dead load.

The ordinary suspended lift is the one now most employed, as it can easily be seen for a high building a direct-acting ram lift is expensive and inconvenient. With hydraulic lifts, however, the great disadvantage is that the power required is not proportional to the load lifted, and they are not therefore economical.

Where electricity can be obtained the advantages of electric lifts should be fully considered. With these the amount of energy used is fairly proportional to the load to be lifted, which as before mentioned is not the case with hydraulic lifts. Another advantage is the flexibility and convenience of the electric system of lifts compared with the hydraulic, and the former is not affected by frost.

Mr. RAVENSHAW recently read a paper on electric lifts before the Institution of Civil Engineers, which resulted in an interesting discussion. Mr. PREECE gave it as his experience with the lifts at the General Post Office and the post-office at Leeds that the working cost of hydraulic lifts was five times as much as with electric lifts; this was with a private plant. Taking electricity from public supply mains at $4\frac{1}{2}$ d. per unit, a case was stated where, with lifts working under similar conditions, the hydraulic lift cost rather more than double the electric. It was mentioned that the first cost of an electric lift is about 10 per cent. more than the hydraulic.

When considering the amount of current required for a certain lift for certain loads, the current whilst running must not be only taken into account, but the starting current must be considered, which is always in excess (about 25 per cent. or more); therefore the greater number of stops of the lift the greater is the average current.

An electric lift consists essentially of an electric motor connected to a winding drum, but the apparatus of chief importance is the controlling, regulating and braking arrangement. Shunt motors are mostly used, connected by worm-gearing.

The usual simple rope control of hydraulic lifts is generally adopted, connected to the switch and resistance instead of the valve, as in the case of hydraulic lifts. The brake usually employed is an automatic magnetic one. With regard to the motor used, this is practically of the ordinary type, but it must be capable of running in either direction without needing alterations of the brushes; it must also have good starting qualities and require little attention. Of course with lifts the variations in load are very great, but as Mr. RAVENSHAW says, "the maximum load is of short duration, the machine being idle for at least half the time."

The motor is connected directly to the winding drum through worm-gearing; worm-gearing, although being less efficient than spur-gearing, is nearly always used on account of its silent running.

Considering the control, the effect of pulling the rope in the car is that the switch is actuated and a resistance is inserted in the motor circuit; this is in order to prevent a sudden rush of current through the motor, which would occur until the motor attained its proper speed. This resistance only allows of current just sufficient to start the motor, and when it has started the resistance is cut out of circuit automatically.

The object of the brake is not only to stop the lift, but it also has to hold it. This brake is usually of a magnetic type which works automatically and applies the brake when the current is switched off, and an automatic device is also generally used to apply the brake at each end of the lift travel. Mr. RAVENSHAW states that the ordinary bar electromagnet is generally adopted, as a magnet of reasonable dimensions can be made to give a pull of a ton through a distance of half an inch.

A mechanical brake is used sometimes, consisting of a band operating on the motor-shaft, and worked by means of the rope in the lift.

It is very essential that a lift should start and stop

quickly without any jerkiness; an electric lift has these capabilities as well as the hydraulic, and the speed is also as high, and no more attention is necessary. It is also essential that an electric lift should not cause fluctuations on the mains from which it takes current, whether these be public supply or private lighting mains. This is overcome by the resistance in the circuit at starting.

It must be borne in mind, where there is a private plant already in existence for lighting the building, that the addition of an electric lift forms a means of further economy with the plant, as a day load is obtained.

It may prove interesting to give a test of the electric lifts at the Leeds post-office, which was made by Mr. PREECE:—

	Load (in lbs.)	Travel (in feet)	Average Current (amperes)	Average Speed (ft. per min.)	Cost in Pence (double trip)
Up...	896	52	26	78.0	05360
Down...	896	52	5	82.1	
Up...	0	52	3	82.1	0532
Down...	0	52	27	76.1	
Up...	448	51	15	80.5	0528
Down...	448	51	17	80.5	
Up...	448	12	13	42.3	017
Down...	448	12	10	42.3	

The balance weight equalled that of the cage plus 4 cwt. The pressure of the current was constant at 105 volts, and the price allowed was $1\frac{1}{2}$ d. per unit, which is what electricity can certainly be supplied at for a day load from a private plant.

In a test made by Mr. RAVENSHAW of an electric lift, he found that the cost of working is lowest at about half load, the cage and load being almost exactly balanced.

These few notes may prove of interest to architects, and they would be well advised to consider the advantages of the adoption of electric lifts where possible.

ST. EDMUND HALL AND ST. PETER'S CHURCH, OXFORD.

A PARTY of members of the Oxford Architectural and Historical Society recently met in the hall of St. Edmund Hall. The Rev. G. F. Lovell said he considered it was almost certain that St. Edmund of Abingdon lectured on "Aristotle" in a building on the site of the present structure, and that the Society whom he taught held their services in a chapel built by him in the church of St. Peter hard by. When that church was used for the Lenten sermons of the University the members of St. Edmund Hall always occupied the front seats in the gallery. In the church's accounts it was observable that members of four colleges who originally worshipped there paid dues to St. Peter-in-the-East, but St. Edmund Hall had never done so, while in several functions there the Hall always took first place. In a very early document three halls were classed together—one in St. Ebbe's, a second called St. Edmunds near or on this spot, and a third that of the four sons of an Edmund close by. Through confusing these Wood arrived at the ridiculous conclusion that the prefix of "Saint" was an error. The hall in which St. Edmund had lectured was given in 1269 by Edmund the Vicar of Cowley to Osney Abbey. This must have been because the Franciscans were not allowed by their rules to hold landed or indeed any property. These points were mainly mere hypotheses, and in actual masonry there is but one doubtful Gothic archway; of its age they could form their own estimate. The present dining-hall, which had not much pretence to architecture, was built in 1680, but it once had a music gallery, since turned into passages or rooms. Apart from the Franciscans, its former occupiers, the hall had not many illustrious names. A Peter Payne or Clerk is, however, on record as a preacher on Wicliff's behalf at the Council of Basle, but he is also stigmatised, when vice-chancellor, as a propagator of forged documents and as stealing the seal of the University. Perhaps their most distinguished member was Mill, whom Tom Hearne, another worthy, puts down as a "rascally Whig," but who was the founder of New Testament criticism. Shaw, chaplain at Algiers, Regius Professor of Greek, took away the lodge and turned it into his own kitchen. He must not forget the learned Tully, the opponent of Bishop Bull, nor Wilson, the Bishop of Calcutta. The buildings north of the small quadrangle were first erected by the monks of Osney in 1451, but they had undergone much change; those further to the east were rebuilt by Principal Airay; these extend to the pump and sun-dial above it, but the line of demarcation is becoming less easy of detection. Principal Shaw restored the rest of the north side in 1790 at a cost of over 300*l*. This range is much plainer on the side facing the churchyard. The

dormers also then introduced belong to this date. The large gap on the south side of the quadrangle was once occupied by a lofty and unpretentious structure. They were never part of the Hall, but were built by Airay's nephew with that intention, his sudden death putting a stop to the design. On entering the chapel, which is fitted with oak seating and cedar panelling, Mr. Lovell said it was erected by Stephen Penton, Principal in 1681, who with the Vice-Chancellor's permission proceeded to melt down the Hall plate and pay his workmen. It was believed to be the first purely Renaissance chapel in the University, Brasenose, which is just anterior to it, being of mixed design, a half-way style. The east window was about the third executed by William Morris. To Canon Liddon, Vice-Principal, they were indebted for the two candlesticks on the credence table, presented 1862, and to Lord Beauchamp for an interesting Common Prayer book, dated 1662, with many curious reprints. Part of the site of the chapel came within the limit of New College, and there was one shilling quit rent paid annually for it.

In the neighbouring church of St. Peter the vicar furnished a list of the more recent changes which had been made in the interior. He found that in 1760 the nave had been repewed with structures much loftier than those now there, which to some tastes are themselves far too high. He believed that these old pews had been cut down to their present level in the course of the alterations made in 1836. The parish had a vicar's house in the north-east angle of the churchyard. This was taken down in 1804, and the parishioners, by way of a substitute, subscribed 350*l.*, which was invested in Consols, and the interest paid to their vicar. This went on till 1870, when the fund was devoted to the present vicarage. In 1813 the gallery at the west end was enlarged, mainly to accommodate the children from the Grey Coat and National schools, nearly, if not quite, the only elementary schools then existing in Oxford. The galleries had during the Lenten services of the University been occupied by undergraduates. From 1820 to 1830 there were many references to gallery accommodation; 1836 brought several changes, but in 1856 it was agreed that the east end was in danger; the turret to the south-east had to be underpinned, the plaster was removed from the chancel walls, and two doorways on the south were for the first time brought to view, the more westerly of which was clearly of an early period as it had a lintel and tympanum. In 1844-45 there were restorations and a new roof to the nave. In 1856 Merton College did a good deal to the church. This was the last material alteration before he himself took charge of the parish in 1867. During the last thirty years considerable repairs had from time to time been carried out. In 1875 the galleries were removed; these were a large western one erected in the seventeenth century for undergraduates, and a small one west of the north aisle. Within living memory there had been a gallery fitted with sash windows, which took the position of the old rood-loft, shutting off the nave from the chancel, which was not then used for any ecclesiastical purpose. The seats lost by the destruction of the western gallery were practically not very numerous, as those below it were so dark and ill-ventilated as to be very little used. Such loss as actually did occur seemed warranted by the diminution in the numbers of the inhabitants. In 1841 the population of St. Peter's parish alone was 1,550, by 1861 it had sunk to 1,174, and now the population of the two parishes—St. John's and St. Peter's—was not much more than 600. The screen north-east of the nave was a benefaction; it served to part off the vestry from the nave. The whole system of lighting had been very much improved. An engraving in "Ingram's Memorials," showing the church without any of the fittings then in it, represented the chancel as approached by three steps which extended right across the church, about 6 or 8 feet westward of the present wall-screen, and then by two more on to the chancel floor; but the steps that were there when Mr. King first knew the church occupied much the same position as those existing now. But when he came there were no choir seats, only an overabundance of lofty pews reaching within 18 inches of the altar steps, inconvenient, ugly, and giving no proper accommodation to choir or clergy. He had considerable difficulty in persuading Merton College to remove such substantial modern fittings, but at last they were convinced of the great inconvenience caused by them, and they entirely refitted the chancel with a new tiled floor, handsome seats for clergy and choir, and the present dwarf wall which bounds the chancel. The pulpit, which formed a part of Mr. Graham Jackson's plans for the alterations, was added by the parish. In 1888 the reredos was erected as a memorial to Mrs. Jelf, and in the present year Mr. Powell presented the opus sectile work on either side of the altar. The Litany desk was also given within the year. Seven stained-glass windows have been inserted within the last thirty years. The vicar said he was staying near Parham, in Sussex, and was shown in the private chapel of Lord Zouche a font which clearly belonged to that church seventy-two years ago, when Professor Westwood made a drawing of it, since published by the Society in 1890. The card attached to

it made its origin quite certain. It had gone by the name of the Adam and Eve font, our first parents standing near a tree of a shape not unlike a common wine-glass, having a serpent winding up the stem, and the part above the stem covered with branches of an apple tree bearing apples. A cover which concealed a marble basin was richly decorated with grapes and vine leaves, and was counterpoised by a leaden angel. Those wooden fonts, he was told, were exceedingly scarce, and there was a great probability that the one in question was carved by Grinling Gibbons. It was said on the card that it was sold to Mr. Robert Curzon, the great collector of antiquities, afterwards Lord Zouch, by Mr. Denison, the rector, and Mr. Hamilton, successively Bishops of Salisbury. As Mr. Hamilton was curate under Mr. Denison, and succeeded him as vicar, the combination of their names points to about 1838 as the probable date of the transaction.

The President, in reference to the drawing of the interior which the vicar had mentioned, said that Mackenzie, who sketched the view, was generally an accurate artist, and it was a well-known fact that Sir Henry Parker had asked him to draw the interior without galleries and pews, as by so doing the good points of the church would be shown best. A prominent object in that sketch was a stone pulpit near the chancel arch on the north side, which had a double entrance, one destined for the use of the University preacher, who was privileged to pass through an arch in the north wall, the other for the vicar. The older font, the original twelfth century one, was ornamented by an arcading carried round it, and figures of the Twelve Apostles, probably, in all but two; three of these panels remained on the portion still preserved in the porch window. It was first figured in one of Hearn's publications, and then in the first volume of the "Archæologia," and was then put aside and used for a well-head in the vicar's garden, north of the church.

The vicar then gave a short account of the stone slab, once used as a credence table, now placed on the north side of the chancel, and explained the origin of the cross patée south of the sanctuary.

Mr. Hurst said the distinctive features of the church were the crypt connected with the Grymbald legend, the very complete ambulatory, the six newelled staircases, the south door and the puzzling remains of an abode over the sanctuary, which was probably the only priest's room over the altar in Oxford or its neighbourhood. Part of the ambulatory in front of the Norman chancel windows could be seen; the passages leading eastward would bring them to the stairs leading up to the angular turrets; by turning, however, at right angles the jambs of two more Norman windows would be found, just avoided by the present sixteenth-century east window. The cills of these windows, which reminded him of the two at the east end of the cathedral, were about 10 inches lower than those of the side windows. The angular turrets had most interesting stairways, of a design lying halfway between the concreted one at St. George's Tower in the Castle and those at four of the angles in the cathedral. The turrets themselves were square in their lower portions and circular above; just where the change was made a series of putlog holes, in all probability, could be detected, very likely used for building purposes. Each turret had three windows of small dimensions just under its conical capping, looking two eastward, two westward, one northward and the other southward. These made him regard the pinnacles, undoubtedly Saxon in outline, as watch-towers, and he would remind them of the Latin distich about one St. Michael guarding the north gate, another the south, and two St. Peters overlooking the east and west entrances of Oxford. Their elevation was not great, but the country they overlooked was in ancient days some of the lowest lying in the neighbourhood, and he was enabled to bring some evidence on this point. The first or Norman church he believed stopped before the line of the east face of the tower was arrived at; in fact, where the mural monument to Dilennius, the botanist, marked a change in the walls. Touching on the question of the tower being detached, as evidenced by the plinth which shows at the end of the Becket or north aisle, he remarked upon the very perfect muniment-room or port-loft, as our fathers called it, and how it contained one of the very earliest books of churchwardens' accounts, which supplied the reader with a mass of most interesting detail about the church, its fittings, its bells, and about the churchyard and vicar's house. In the year 1481 the material for the porch and room above was stated with its price; there were six or eight items about bells on nearly every page, the leathern loops which held up the clappers, the baldricks were always wearing out, the wheels and the ropes required constant renewing, the lusty peals that rang out every year on St. Hugh's Day, the day of Queen Elizabeth's accession, or for victory over the Armada, drew many a shilling from the churchwardens' pockets. There were beside the parish armour and fire apparatus to be kept in order, the bellows of the organs required mending, the "dung" from around the church must needs be carted away, not far though,

only into the adjoining lane. In 1507 Robert Carow was paid "for the makyng of the tymber work off the Rodelocht," Joan Olys for blacking its "bemys," and then the painter for colouring the same; the latter received 4*l.* 13*s.* 4*d.*, equal within fourpence to the vicar's salary for a year. In 1600 Mr. Howkens walled up the door to the rood-loft; its outline was just traceable in bright weather over the narrow arch near to the organ. There was frequent mention of the "alabaster man" in connection with this and another screen, and some might remember the alabaster work at Yarnton which was found in this neighbourhood. In some places they read of the parishioners decorating the church, once with whitewash, later on with Scripture texts. The parish had been loyal to Queen Bess all her life, and after her death a picture memorial of her lying in state, with a lion as her pillow and another as her footstool, was executed in gold and red and green on the wall next eastward of the northern doorway. Its repairs were often alluded to, as is the adulatory inscription beneath it. It was finally whitewashed over about 1818. Reverting to the east end, he drew attention to the beautifully carved shaft near the south window of the sanctuary, explaining that it was made up of an entire one and nearly half of another. It was in style like nothing else in Oxford, or perhaps the whole of the Midlands, till one arrived at Ely, where round the prior's doorway was some twelfth-century ornament of very similar design. The church had had three dedications, the original one to SS. Peter and Paul, as evidenced by the two statuettes over the porch, and by the two shields with cross keys and cross swords within quatrefoils over the monster buttress. A second is the usual one. A third is to St. Peter ad Vincula, or at the chains. This last does not seemingly occur before the true dark ages of Christian art, 1727, and the unique groining ribs quite at the east may have suggested the title. They would observe that there were in it broad links and narrow ones. The present gaslight was sufficient to show that the narrow ones had remains of chevrons along their edges; they were clearly cut from ribs like that transverse one which halved the vault of the choir. The origin of the double or wide links is equally evident. There are at Iffley, east of the tower, pateræ or little square ornaments, some identical with, some greatly resembling those in St. Peter's. In both cases there is one patera to one stone; these quasi broad links are each formed of two stones placed side by side just as at Iffley, a corner is clumsily hacked out of the angles, and no attempt is made to make the mouldings of the narrow link join those of the wider. These two ribs were surely never carved *in situ*. He thought the broad links were used-up material from near the chancel arch, clearly one of modern construction. With the drawings of these parts were circulated two photographs taken within the tower, which Mr. Park Harrison had caused to be done that he might give the Society an opportunity of remarking in the one upon the remains of a ledge-jamb to a window, and in the other the Saxon masonry which lined the tower. Mr. Hurst considered the whole tower to be post-Norman at least, and was unable to support that gentleman's views; he could very well understand that the older method survived even down to the Decorated period. In Carfax tower, too, where this feature occurred, there seemed to be nothing pre-Norman, since the supposed casing-in of its lower portion was found to be imaginary by the investigations lately made.

The question was raised whether the crypt should be inspected or not. The President thought the members would think the building was slighted unless they visited the crypt. The position of the two passages under the seats of the nave, which once led down to the chamber, had already been explained. It was too late for several of the party to proceed there, and nothing like an account of its architectural peculiarities was attempted.

SHETLAND BROCHS.

ON the coast of Shetland there are, says the *Scotsman*, the remains, in many cases only the sites, of ancient buildings, which of late years have attracted considerable attention. Many of them were large buildings, lofty, circular, of immense strength, and filled, tier above tier, with small rooms, to which a winding stair gave admittance. Much has been said and written about the purpose for which they were built and the people who built them. But the period of their erection has receded so far into the remote past, and the people who built and occupied them have so completely vanished that not a local trace of either purpose or people remain, except a faint tradition that they were a people of small stature.

The Broch of Monsa is now the only one remaining in what may be called a state of ruinous preservation. It appears to have been the last broch erected in the islands, and was in a perfectly habitable condition when some of the other brochs had fallen into decay. All who have entered Bressay Sound from the south have seen it, but those who have visited and examined it are so few that to give an idea of the class of

buildings to which it belonged, a brief description of its structure and interior arrangements may be necessary.

The diameter of the circular site is a little more than 50 feet, and the building itself is constructed of schistose stones nearly uniform in size and strongly built without cement. The building rises to the height of 40 feet, bulging from its foundation and drawing narrower towards the top, when it again enlarges in a bell-shaped form making the top overhang the portion of the wall below, thus making the wall most difficult to scale. The entrance-door is so low that a person can only crawl through it on his hands and knees, and the wall is of great thickness. The diameter of the area within the walls is about 20 feet, and the walls are perforated by three or four vertical rows of holes, numbering from eight to eighteen in each row, and designed to give light and air to their respective compartments. Above the ground-floor a door leads to a stone stair which communicates with the rooms, and the rooms communicate with each other. The shell of the broch consists of two concentric walls divided into apartments. The rooms are low, but a few of them rise to the height of 5½ feet. The building was evidently skilfully planned and strongly built for defence, and in those early days who could the dreaded maritime assailants have been? Defence seems to have been the absorbing aim. The rooms between the walls afforded concealment for the women and children and places of security for valuables and provisions. The entrance door could only admit one person in a crawling position, and the walls were so constructed that they could not be scaled. A long siege on such a coast was impossible. It could not be reduced by famine, as the shores abounded with small fish caught from the rocks at night. There were underground outlets and entrances known only to the inhabitants themselves, and yet the precautions taken prove that a powerful enemy had to be guarded against, who might render all their efforts futile.

A few of the brochs were in such a preserved condition that the Scandinavian chiefs found accommodation in them at the commencement of the Norse period. One of them built in the sea afforded shelter and defence to a valiant sea rover and outlaw, and in the tenth century Biorn was married in Monsa and lived there with his wife for the greater part of a year. In much later times an attempt to besiege Monsa was actually made. In the fourteenth century there were two earls in Orkney. One of them died and was succeeded by his son Harold. The widowed Countess was inclined to marry a man so objectionable to her family that Harold banished him from the islands. Soon after she captivated Harold's partner in the earldom, married without his consent, and fled to Monsa. Harold collected a fleet, sailed north and invested the island. The Countess and her husband retired within the castle, which Harold found impregnable. He was then reconciled to his father-in-law. They united their forces, sailed south together, conquered their enemies who had leagued against them in their absence, and lived in amity ever after.

The Broch of Ester on the north-west corner of the mainland must have been in its day one of the most imposing structures in the islands. It was built near the sea, and close to a small loch and burn from which the locality derives its name. There is deep water close to the rocks, along which a heavy swell from the ocean always runs, and for a considerable distance there is not the smallest creek where a boat can land. The castle stood towering alone on a long unbroken line of coast. Before it was removed, after 1840, it formed a huge unshapely mound of stones, and yet, unless the stories handed down were purely imaginary, it was inhabited by human beings, living apart from their neighbours, as late as 1715. Its size had been such that it furnished stones for building a park dyke 6 feet in height and a mile and a half in length, and the materials are not yet exhausted. Many of the stones were of such size that they had to be broken in pieces before they could be removed. Like Monsa, it was circular in form, and had concentric walls with compartments between them. Traces were found of the winding stair leading to the various rooms, and the underground passage leading from the area inside to a place some distance from the building was easily traced. As the excavations went on, several articles, such as querns, knocking stones, stone mallets, hatchets, corn hooks, knives, weapons, heaps of shells and fish bones, bones of sheep and poultry and of oxen of a large size, were found. There was also found a rude kind of pottery, and various other articles which, in the present day, would be considered of much value. Unfortunately the landlord, though a life-long student, was not interested, and the workmen looked on the finds as unhallowed things and threw them into the sea. A similar fate befel the articles found in the ruins of all the brochs when the stones were removed for building purposes.

There were between twenty and thirty brochs in Shetland. Several on the coast and all in the hills and on the holms in the lochs were of small size, but the whole were built on the same plan and with the same precaution. Some of the hill brochs must have fallen into decay when the islands were colonised by the Northmen, because Norse names signify-

ing a large cairn or heap of loose stones were applied to them.

To give an opinion as to the builders and occupiers and date of building of the brochs is to tread on debatable ground. Very seldom will two men who have given attention to them be found to agree. The materials on which to found an opinion are too scanty. The buildings themselves furnish the only data. Their builders must have been men of low stature, of great personal strength, foreseeing, skilled builders, considerably advanced in civilisation and liable to sudden attacks from dreaded and powerful enemies. They were acquainted with the growing of corn, the rearing of cattle, fishing, and they lived in small communities. The brochs themselves afford evidence of this.

It is difficult to prove, but Shetland must in early times have been inhabited by three different and distinct races, all of small stature, or the same race must have reached in the course of time three distinct stages of civilisation, culminating in the building of the brochs and the civilisation they indicate. The latter view cannot be the correct one. Owing to the isolation of the islands in those early times, it is most unlikely that a people so few and scattered, so remote from outside influences, and so very uncivilised as the earliest inhabitants were, could have any ideas beyond those of food and shelter. It is possible that they were here when the islands formed part of the continent, and that they were invaded and exterminated cannot be doubted. The civilisation of a people can be safely inferred from the nature of their dwellings, and the earliest inhabitants were so low that they seem to have taken their ideas from the inferior animals. They burrowed. Their dwellings were a round hole dug out, often in a level field, and approached by an entrance very like a rabbit hole, only it was covered and lined along the sides with rough stones. The head built or nest and the entrance were covered with earth. The holes between the stones in the entrance are filled with soot, which has taken to some extent the consistency of coal. The people who lived in those houses could not have built the brochs.

The second race was considerably advanced. They were mound builders. They built their houses of stone, tapering towards the top, roofed them with slabs, and covered the whole with turf, so that the building looked like a large knove; the entrance sometimes closed with a stone, made to move aside easily by the people themselves, but to look like the face of a rock to strangers. In almost every case an underground entrance led to them. They were devoted to hunting, lived in the pastures, were good archers, dressed like civilised people, and unless our forebears were for thirty generations the chiefs of romancers they were a living people from the beginning of the Norse period to the close of last century. The mound dwellers were a people of stationary habits and loved concealment. They were a one-roomed people. Danger might have compelled them to excavate a hillside and build there, but the conception of building a huge tower filled with rooms on the most exposed parts of the coast was far above them. The mound builders did not build the brochs.

The latest invaders of Shetland prior to the arrival of the Northmen were the Finns. They were driven out of Scandinavia some time about the beginning of the Christian era. They were a stock-raising, seafaring people, of low stature, skilled in several forms of workmanship, excelled as boatmen and were as civilised as their conquerors. Their occupation of the islands must have covered a period of 500 or 600 years at the least, and during that period the brochs must have been built. It is incredible that those buildings, however strongly constructed, could have withstood the tear and wear of a climate like Shetland for more than 2,000 years. In that time rocks have been worn down, islands have been formed and the coast line considerably altered. They must have been built within the Christian era, and it is not likely that any of them can date further back than the time when the Northmen, or men of that race, began to appear on the western seas. The first Vikings came as solitary stragglers. They frequented the voes and creeks, and it is there where the smaller brochs were built as defences against them, and which only could have been serviceable for a very few centuries. When they began to arrive in large numbers then the huge brochs were built on the coast. The Northmen did not build them. They were utterly unsuited in structure and interior arrangements to their ideas and habits, and they did not visit western lands with the intention of erecting defensive castles involving much time, severe toil and a very large number of men to complete. Besides, they had no formidable enemies to fear in the northern seas. They found the castles here at the period of colonisation of the islands. The larger of them, in cases of need, afforded them temporary shelter and defence, and the smaller were falling into decay. The name "Picts' castles" has been applied to them only in very modern times. Shetland has never been invaded from the south. There is no tradition of a Pictish occupation before Shetland became a Norwegian colony, and there has been none since. Unless the mound builders and the Picts were the same people, the Picts have never had a

residence in Shetland, and therefore could not have built the brochs. As high antiquity the brochs cannot claim. They were defensible fortresses in the time of the early Udallers, and in the fourteenth century Monsa was impregnable.

As the brochs could not have been erected by the Picts, nor by either of the two earlier races who inhabited the country prior to the commencement of the Christian era, and as they were not built by the Northmen who took possession of the country in the ninth century, the people who inhabited the islands at the period immediately preceding the Norse colonisation must have been the broch builders. The Finns, who were thoroughly acquainted with Shetland and Shetland people in former times, knew every rock and creek and every spot of fishing-ground around the coast, were friendly as individuals but enemies as communities, must have been the leading people in the islands when the Viking warships first appeared on the coast, and the brochs were built by them as places of defence, concealment and habitation against their invincible enemies, the Northmen. When they were at last compelled to fly from the islands they had claimed as their own for long, the mound dwellers, who had been subject to them, entered into possession of the brochs, and thus the brochs became associated in later times with the name of the Pechts.

THE STATUE OF CHARLES I.

IN the January number of *Middlesex and Hertfordshire Notes and Queries* is an interesting article by Viscount Dillon, president of the Society of Antiquarians, on the statue of Charles I. at Charing Cross. In 1631 Le Sueur (a pupil of John of Bologna) agreed with the Lord High Treasurer Weston (later Earl of Portland) to make a statue of the king, "the horse being bigger than a greater horse by a foot, and the figure of His Majesty King Charles proportionable full six foot." The whole was to cost 600*l.* and to be executed in bronze within eighteen months of the agreement, dated January 16, 1630-31, and was destined to be erected at Roehampton. However, the heroic size was abandoned, and we have the statue of life-size. It was cast near the church in Covent Garden, but does not appear to have been erected anywhere, and we only hear of it again when it came into the hands of the Parliament, who sold it to John Rivett, a brazier, living near Holborn Circuit, with orders to break it up. Rivett, however, had an idea that the whirligig of time would change matters, and accordingly he buried it, but produced pieces of metal purporting to be fragments of the statue. These he sold to both political parties with profit to himself.

In May, 1660, which must have been before the actual restoration, for Charles II. only arrived in London on the 30th of that month, the Earl of Portland requested the Lords to order that the statue, the whereabouts of which he professed to know, should not be removed from its then location nor defaced. In July of the same year the Lords ordered Rivett to permit the Sheriff of London to serve a replevin on the statue. Cunningham, who gives the above account, states that he was unable to learn more of the matter. Anyhow, about 1673 we have Marvel's sarcastic poem on King Charles I.'s statue, "Why 'tis so long before 'tis put up at Charing Cross." In this poem allusion is made to the other statue, set up May 29, 1672, at the Stocks Market, the site of the present Mansion House, by the loyal Lord Mayor, Sir Robert Viner.

The statue presents the king bareheaded, and holding in his right hand a bâton, which he rests on his thigh. He wears a demi-suit of armour, the lower legs being cased in boots much crinkled, as was the fashion at one time. Across his right shoulder is a scarf or sash, such as Cruso tells us in his "Instruction for the Cavallrie," 1632, all horsemen should wear "of the prince's colour whom he serveth, and not put it off whether he be alone or in companie upon great penalties, by which meanes (besides the ornaments) they will forbear many unfitting actions (as being subject thereby to be distinguished), and upon occasions of battell they shall be sure by that means not to offend each other." This armour, with which is worn also a high falling band or collar, does not resemble in form or ornament the complete suit of gilt armour presented to the king when young, and now in the Tower of London. The absence of any headpiece is noticeable, for though many portraits of the king show him with his helmet borne by an attendant or resting beside him, it will be remembered that at Edgehill he wore a black velvet-covered iron hat. The hat is said to be that now shown at Warwick Castle, but the covering has, of course, disappeared. The fashion of metal head-pieces so covered was very common, and readers of Pepys will remember his visit in March 1665, with Sir J. Minnes, to James Duke of York, who was about to return to sea:—"I saw him try on his buff coat and hat piece covered with black velvet." The hands also are bare. The horse furniture is a very good example of the equipment of that day, and closely resembles that shown in Cruso's work, some or all the plates of which are taken from Wallhausen's book, 1616. On the near fore-foot of the horse is the inscription, "Huber Le Sueur [fe]cit 1633."

NOTES AND COMMENTS.

PRIOR to the invasion of Venice by the French Republicans a century ago there was on the west side of the Doge's Palace at the middle gallery a very large relief of the Lion of St. Mark. It was erected between 1523 and 1538, during the reign of ANDREA GIOTTI. Sometimes the Doge used to invoke St. Mark in front of it. The relief suffered much from the vandalism of the invaders, and from time to time efforts were made for its restoration. In May 1895 a competition was arranged among Italian sculptors, one of the conditions being that the cost was not to exceed 18,000 lire, or 720*l*. The successful competitor was URBANO BOTTASSO. The work is now complete. The Lion is about 11 feet long, and a figure of a Doge is introduced kneeling and clad in the sumptuous official robes.
